A.D. 1525. Each letter is placed in a square, and a relative scale of proportion is worked out to one side of the square. Thus the thickness of the main shafts of the letters is one-tenth of a side. The great curves are struck from circles nine-tenths of a side in diameter, the smaller curves from circles respectively one-third, one-fifth, and one-tenth of a side in diameter, and the distance of the uprights from the side is generally one-tenth. Now I know I must face a protest against a mechanical hard and fast rule for the drawing of letters. But the objectors, if such there be, must not too hastily conclude that this example is nothing more. To begin with, it will be a singularly good alphabet. And a little consideration will show that Durer—the last man one would expect to tie himself down to a formalism—did not invent the construction to produce the letter; but seeing that the letter was good, worked out the natural law of its excellence, and set it down for the benefit of his fellows. This alphabet with construction is to be found—essentially the same—in nearly all the copy-books of the period. Only one explanation is possible. The form of the letter was, as I have said, practically invariable. Up to the invention of printing, it had been a workshop tradition handed on by rule of thumb from master to apprentice. But as soon as a generation had well learned to read, the multiplication and cheapening of printing processes at the end of the fifteenth century created a demand for the means of learning to write, and the result was the production of the copy-book in the beginning of the sixteenth century, and the publication of methods which were not new; but only now for the first time made easy of access to those interested.

The influence of material on the form of the letter is a matter that the craftsman can only work out for himself. It is impossible to give him rules or teach him his limitations. For the very fact that he is entrusting himself with the making of an inscription implies a mastery of his tools, and if he has acquired a good form of letter those tools will do the rest. Yet it is necessary—with so inconsiderate and light a heart does a man often set about a serious operation—to point out

One Danger.

He must not take a style of lettering which is good in one material, and for one purpose, and try to adapt it by brute force to other circumstances. His method of study must be a genuine one, and it goes without saying, somewhat laborious. I can give it in no better words than those used by William Morris in describing the means by which he arrived at the first of the Keimscott types. Having decided on Jensen's type as his model, he set to work to learn it, "Drawing it over many times," said he, "before I began designing my own letter, so that though I think I mastered the essence of it, I did not copy it servilely." That, indeed, is the crux of the whole matter of learning to make good letters. The essential form of a good model must be acquired till it can be produced without conscious effort, and, as it were, automatically. The personality of the craftsman, and the materials with which he is working, will then

re-act on this, giving it interest, beauty, or character, according to his talent.

Before leaving the discussion of the form of letters to deal with one or two points in the application of them, Mr. Strange made some remarks on the subject of type. Continuing, he said: Nothing is more irritating or defeats its own end more thoroughly than an eccentricity in the form of the letters which withdraws your attention from the word which they are used to make. For this is, after all, one of the greatest faults of the modern maker of letters; he is so eaten up with his ingenuity or phantasy as to forget that his letters are only the elements of what should be a legible announcement. It should be unnecessary, even ridiculous, to remind craftsmen that the

Purpose of Making Letters

is to convey information and not to advertise their own dexterity; but the examples of every-day life seem to show the former to be too often the last consideration. The modern poster depends, as a rule, on a design of weird tints, which may or may not be capable of suggesting anything to the beholder save a pardonable desire for colour-blindness. The lettering, very often tied in an inextricable knot, dances drunkenly across a portion of the design; or in great mis-shapen masses makes it top-heavy. No one seems to dare to try the experiment of extreme simplicity; a good, bold, well-chosen letter, spaced with regard to the relative value of the different portions of the announcement and free from any complications of pattern of any kind whatsoever. Yet surely it is one of the highest canons of fine art that beauty and force are dependent upon simplicity rather than elaboration. The fact is that too much attention is given to the letter as a unit. It must be considered in relation to its fellows—the whole alphabet as a whole—for it is only after you have settled the shapes of your letters that your designing begins, when the question arises as to what you will do with them.

The craft of letter making is not to be lightly laid aside as a mere appendage of another art. It is the easiest thing in the world for an artist who has made a fine work of art, a medal, a piece of sculptured decoration—anything you will—to spoil it utterly by the badness of the inscription. For human nature is such that it cannot forgive so obvious a fault; the very label, as it should be, of the perfection of the handicraftsmanship. It is easy to make a great church or public building appear indescribably mean by the badness of the lettering displayed on it; while nothing can be more decorative or dignified than a well-proportioned, simple block of lettering in its right place.

The makers of letters, whether in the arts or books, must take themselves more seriously. They must realise the greatness of the audience to which their works may appeal, and divest themselves of little personal eccentricities accordingly. And how great and splendid that audience may be if the lettering only rises above the petty fashions in ornament that live but for a day or two, may be suggested to you by a remembrance of the inscription from the base of the Trajan Column. Millions of passers-by have been able to read those words as easily during eighteen hundred years as if they had been carved yesterday. And no single designer, nor the aggregate influence of all the generations since has been able to alter the form, add to the legibility, or improve the proportion of any single letter therein. That is my case.

— The new English Church at Assouan is now completed. The cost, exclusive of the furniture, has been £1,290. The ground all round the church still needs to be levelled and surrounded by a wall, and no provision for any flooring in the edifice has yet been made.

Sudden Death of a Newcastle Architect. —Mr. F. Vanse, while returning to his residence in Whitley on Wednesday last, after having bathed in the sea, was seen to drop to the ground, and on being picked up was found to be quite dead. An architect by profession, he had been acting as assistant in an office in Newcastle for about twelve months. He was only twenty-four years of age.

* A paper read before the Applied Art Section of the Society of Arts on May 22nd, 1900.

"BUILDERS' JOURNAL" SHILLING FUND.

IT was our intention, as announced in last week's issue, to close this fund on Monday last and publish the final list of subscriptions in the present number. But just as we go to press several collecting sheets have come to hand, some with many names on them, and as we have not space to publish these in full, we are obliged to defer publishing the final list of subscriptions until next week. There are, therefore, still a few days during which we are open to receive contributions. Anything sent in this week will be included in the final list to be published in next week's issue. It will be seen that the fund now amounts to 3,499½ shillings.

THE NEW SESSIONS HOUSE.

ON page 327 of the present issue will be found the decision arrived at by the Court of Common Council on Thursday last with regard to the new Sessions House. On the eve of going to press we are able to obtain some particulars of the design (numbered "4") recommended by the Committee. It is estimated to cost £265,000, as compared with £217,000, the estimated cost of executing No. 6. Professor Aitchison reported that the plan of No. 4 was excellent, that the architect's fronts were simple, dignified, and effective, and that his grand staircase and the halls in connection with them were striking. The Committee thoroughly agreed upon the curving of the whole of the Newgate Street façade. The Chief Commoner laid stress upon the fact that the Committee considered that it was a great advantage that the four courts should be placed on the first floor, being approached by a main entrance from the Old Bailey, 14ft. in width, leading into a spacious entrance hall, 21ft. high by 100ft. by 40ft., with bold corridors right and left, of the same height and 20ft. wide. Immediately facing the entrance was a grand staircase, 13ft. wide, and this carried the public to the first floor. The four courts were placed together, opening out upon a spacious central hall, which was approached by a fine staircase, and surmounted by a dome. With regard to the courts, the most important feature was that there was a private corridor connecting them with the various retiring rooms for the Judges, Lord Mayor, Sheriffs, Recorder, and Common Serjeant, and to this corridor the public would have no access. There was also a staircase leading to the Grand Jury room below. The cells had also private staircases to the dock. It was further pointed out that the Committee had considered it highly desirable to check the cubical contents of the building, and for this purpose an eminent quantity surveyor was appointed. The figures were gone through and found to be correct, but, in the opinion of the gentleman in question, although the architects had estimated the cost of the building at 1s. 6d. per foot, it was more likely to be 1s. 10d., owing to the increased cost of material and labour since the time (September) when they made up their prices. Professor Aitchison also advised that the successful competitor would have under any circumstances to make working plans, and must consult every official from the Recorder to the turnkey in order that any modification or alteration really needed in small matters of detail might be made on the advice of those having an intimate knowledge of the requirements of the various offices. The arrangement of the witnesses' rooms were excellent, the apartments for witnesses immediately required being close to the courts on the opposite side of the great central hall. A separate room was also provided on the ground floor for special witnesses. The various offices of the officials were approached by a separate door, and were quite apart from the main entrance. The design was essentially English, and was decidedly dignified and impressive.

SIR WILLIAM RICHMOND ON ARTS AND CRAFTS.

AT last week's opening of the Victoria Art Gallery at Bath, particulars of which will be found on page 334 of the present issue, the speakers included Sir William Richmond, who, as everyone knows, is superintending the mosaic work now in progress at St. Paul's Cathedral. Fifty years ago, he said, there were only two or three art schools in London; now there were scores of them. Next to John Ruskin, William Morris did more than anyone to root out the commonplace in England, to make people understand that the study of beauty was as important as the study of utility. There was then no Tate Gallery, where now were exhibited the masterpieces of English art-works which proclaimed the versatility and refinement of English art. Although in Academic technicalities the French might still be ahead, they could not be said to have attained precedence over English art as regarded individuality of vision or poetry of conception. One of the most marked features of English art was the absence of mannerism, a healthy love of detail, and a certain freshness with which Nature was regarded by English artists. He should like to call their attention to the art of sculpture, and to the extraordinary and swift progress that her votaries had been and were making. Never in the history of English art had sculpture had so vigorous an existence as now. He begged them not to neglect this noble art, even for the sake of the more popular and more remunerative and attractive art of painting. Now, a few words on that favourite hobby of his, the lesser arts. Technical schools where they were taught were springing up in most of the towns of England, where were studied enamel, wood carving, repoussé, and cast metal design, embroidery, tapestry, and such like; and it was being demonstrated by them that a latent fund of capacity had been lying hidden, which was now being roused into activity by opportunity for its display and emulation for its stimulus. And now, if ever, was the moment to foster the efforts which craftsmen were making not only to design, but, what was far more important, to make articles of daily use and common service. Important, indeed-were they not?-these crafts whose efforts resulted in beauty or the reverse, seeing that they handled them daily, and they were ever before them. Once they had succeeded in making the majority prefer good design to bad design in things in constant use they would soon abjure the vulgar and the commonplace and come to see that there was no reason why the simplest, even the least costly, object should not be graceful and desirable and a work of art. Referring to architecture-the mother of arts-the speaker said it might be granted that the cathedrals and parish churches of English building and design were amongst the noblest works of art in the world, yet how lamentably ignorant were the majority of folk concerning their beauty, even of their dates. Might he make a suggestion to their library committee? Photography had now reached such a pitch of excellence, and its results were so inexpensive, that at a comparatively small cost a collection of photographs of English cathedrals and celebrated churches could be obtained. He made bold to suggest that such a collection be placed in their library. It would possibly kindle a desire on the part of many to take up with interest and intelligence the study of architecture, which would prove to be as fascinating as it was desirable. He confessed that he held the opinion, which he knew many artists shared with him, that too much attention was concentrated upon pictures to the exclusion of other productions, and that painting was regarded as the chief medium through which an artist conveyed his inspiration and impressions. One more suggestion. Gainsborough executed some of his most interesting portraits in Bath. He was not aware whether any of these remained in the families for whom they were executed, or not.

ROCHESTER CATHEDRAL, FROM THE CASTLE.
DRAWN BY HEDLEY FITTON.

If so, their owners would be benefactors to Bath in permitting their treasures to be exhibited in this new gallery. Indeed, he could not think of a more worthy inaugural exhibition than that one would be which represented the genius of Gainsborough as it was displayed during his residence in Bath.

Views and Reviews.

FACTS ABOUT THE HOUSING PROBLEM.

The publication of the second edition of Mr. George How's reprint of his valuable studies in the London housing problem is very opportune in view of the discussion on the Government Bill relating to the subject. As we have already expressed our sense of the value of this book to all who wish to be correctly informed on this most pressing of social questions, we need do little more than call attention to the fact that this new issue has been revised and enlarged, and contains an introduction by Sir Walter Besant. Mr. Haw deals in a concluding chapter with a number of remedies which he thinks would remove, or at any rate alleviate, the evil of over-crowding. Needless to say they go very much further than the tentative proposals of Mr. Chaplin's bill. Mr. Haw has no panacea to offer, but looks for reform in many directions, and as one reads the practical suggestions he has to offer, one feels that the problem is after all not so hopeless as is sometimes supposed, for few of the needed reforms are at all revolutionary and most of them could be carried out without any change in the existing laws. The chief value, however, of this book lies, we think, rather in its statements of facts than in any proposals for reform. As Sir Walter Besant says: "The facts are startling. They go far beyond the current belief and opinion upon the evil." In these pages the facts are marshalled with admirable clearness and force, and whoever would know what is the real problem of the housing of the poor can have no pleasanter and no more reliable means of gaining the information than the perusal of Mr. Haw's well-written chapters.

"No Room to Live." By George Haw. London: Wells Gardner, Darton and Co. Price 2s. 6d.

ROCHESTER CATHEDRAL.

Rochester is one of the least satisfactory of our English cathedrals. Hemmed in by houses, its outward appearance is not very

impressive; the fabric has had a most chequered existence, and bears traces of the bad treatment it has received at the hands of the fifteenth century builders, who seem to have been inspired with a desire to improve upon the original Norman work, and later at the hands of modern restorers. Nevertheless, it contains a great deal that is very beautiful and interesting, and Canon Benham's little book on the Cathedral is a very readable, and, in the attractive form Messrs. Isbister have given to it, a very charming production. It is embellished with a number of excellent pen-and-ink drawings by Mr. Hedley Fitton, two of which are here reproduced. In a little book of sixty-four pages which is evidently intended to serve as a popular guide to the cathedral or a pleasant souvenir of a visit, one does not, of course, expect anything like elaborate architectural criticism; Canon Benham, however, does not omit to deal in a popular way with many points of interest in the architecture, though he is somewhat over lenient towards the misdirected zeal of modern restorers. An example of the way in which one of these, Lewis Cottingham, who carried out a somewhat exten-

sive course of renovation in 1825, blundered in regard to historical accuracy as well as artistic taste is mentioned by the author. In renovating the beautiful chapter-house doorway, Cottingham found that the head of one of the figures, which symbolised the Christian church, had been broken off; he accordingly added a bishop's head and a cathedral and crosier, not knowing that the Church was always symbolised by a female figure. A ground plan of the cathedral is given and a few notes are included on Rochester's associations with the past, but undoubtedly the chief value of the book lies in Mr. Hedley Fitton's clever sketches, which are a pleasant variant on the photographic reproductions usually found in books of this kind.

"Rochester Cathedral." By the Rev. William Benham, D.D. London: Isbister and Co., Ltd. Price 1s. net.

DRAWN BY HEDLEY FITTON.

Current Periodicals.

The *Canadian Architect* for May has articles on "The Commercial Value of Art," by Mr. A. O. Elzner; "Hints on Reading Plans," by Mr. James K. Carpenter, and an interesting illustrated one on Maori art, by Mr. R. M. Fripp, F.R.I.B.A., in which he points out the high place the art of the Maoris takes among savage nations, notwithstanding they were a people addicted to cannibalism, engaged in perpetual warfare, and sunk in gross superstition. Instead of our "boasted civilisation" ennobling their ideals, we have, of course, sent our galvanised iron, our stolen former-age "design" and cheap manufactured goods, not content with providing those other blessings, the rum bottle, the rifle bullet, consumption and small-pox. There are a number of interesting and useful short articles, and several papers that have already been published in the English journals. The plates consist of a sketch for a bungalow of the cosy-corner type, rather badly planned, and a perspective sketch of a very effective and neat little brick Baptist church, at London, South Ontario, with half-timber porch and gable. This church is entirely adapted to the country, expressive of its use, suited to its denomination, and, we are happy to see, is not decorated with forms elaborated by a people of another country and climate, or of an architecture of the past with its tradition broken; the architects are Messrs. Burke and Horwood, of Toronto.

The *Architectural Review* (Boston, Mass.) for April contains an article by Mr. Robert Brown on "Old Woodwork in English Churches," well illustrated with a number of rambling sketches. The article is of a fragmentary character, and does not pretend to be anything else. Mr. W. P. P. Longfellow contributes a memorial notice of John Ruskin, in which he endeavours to take a scrupulously judicial view, but does not avoid, we think, displaying a certain amount of bias. The plates consist of competitive designs for the New York Custom House by Mr. Cass Gilbert and Messrs. Carrère and Hastings.

The *American Architect* for April 28th has an article on "Painting and Painting Specifications." The illustrations are of but ordinary merit; the railing in East Thirty-sixth Street, and the railing and gate at No. 681, Madison Avenue, New York, are good suitable pieces of work, but the railing

at 38, East Thirty-seventh Street, is much too flimsy. The points to always keep before one in designing ironwork, as in everything else, are that the forms must be suitable to the material, to its intended uses and its situation; the last point is the one generally ignored in metal-work, for although a frail piece of ironwork may be suitable to the interior of a building, if placed in the open air it will decay, and is sure to suffer injury. The New York "Box-Stoops" in this number are characteristic horrors. Some neat and simple furniture designs by Mr. R. Brown, of Boston, are also shown. The number for May 5th gives the continuation of the series of articles on architectural acoustics. Several illustrations are given of the Court House of the Appellate Division, New York, to which we have referred before. St. Olave's Grammar School, by Mr. E. W. Mountford, is one of his characteristic pieces of work; the plan is somewhat rambling, but the building shows how a pleasing result may be obtained by simple regard to proportion and material. In the issue for May 12th a further paper is given on architectural acoustics. The illustrations are interesting, but that is not saying the subjects are good. The house at St. Louis is an example of how Classic

styles should not be treated; if the worker considers that a style suitable to his country is not suitable to him, it is quite allowable for him to decide to work in a foreign one, but then unless he works with the ideals and spirit of the creators of that style—that is to say, works with academic accuracy—his work will merely become a trivial patchwork of styles of peoples foreign to each other and of different stages of growth; this is the manner in which this design has failed, and likewise the houses at Tuxedo Park and in East Sixty-eighth Street, New York. This last also shows a very crudely designed bay window. The house at Baltimore is somewhat better than the others, but fails from the misuse of material, brick columns always looking bad. The issue for May 19th contains nothing of much interest. Designs for the Pan-American Exhibition Buildings at Buffalo, N. Y., are given; they are of an extremely false Classic character. Further illustrations of the Court House of the Appellate Division are included. The George Draper Memorial Church, Hopedale, Mass. (Mr. E. J. Lewis, jun., architect), is a simple Gothic structure, without ornament, but would have been improved by using smooth stone—the large roughly-hewn blocks ruin the scale—and tiles instead of slates. The furniture designed for this church by Mr. Robert Brown is suitable.

The Architectural Record (New York) for April is a most interesting number. Mr. G. A. T. Middleton, A.R.I.B.A., contributes "Some Notes from the Rhine Valley," illustrated with very meagre sketches. Mr. Jean Schopfer writes on wooden houses in France during the Middle Ages—or half-timber, we should call them. These houses were built on the system called *pan de bois*—a system of framework in which the resistance of the timber, serving in turn as brace, or support, or belting-course, is greatly increased by the multiple combinations of the joinery. The spaces left between the different pieces of framework were pugged or filled in with old plaster work, bricks, &c., which do not bear, but simply stop up. The *pan de bois* constitutes the carcass of the house. It is, in fact, the present method of building in wood, the only one that French carpenters know; but the wooden framework is now exclusively employed for attics and upper storeys, stone or brick forming the bearing part, whereas in the edifices of the Middle Ages the *pan de bois* was systematic and general. We would suggest that this very effective system of brick filling might be adopted in London in place of the untruthful and absurd half-timber work done under the London Building Act, where, as the plaster or rough cast cannot be done except on a backing of brick, it would be much preferable to use the bricks as a face direct. The illustrations of entrances to sky-scrapers show the depths of degradation to which the system of copying design can take us. Mr. L. P. Gratacap writes a practical and sensible article on the making of a museum, illustrated by the design of the Museum of Natural History, a huge, ugly, barrack-like structure, which is happily not yet completed. Mr. E. C. Gardner contributes an amusing article, illustrated by some remarkable specimens of the ridiculous stuff built under the name of Architecture. There are a number of illustrations showing how natural forms can be utilised in design, a subject often treated on.

Architecture (New York).—The May number of this magazine has the following note which is exactly applicable to our own contentions for the registration of architects:—"One of the strongest arguments in support of the licensing of architects is the reaffirmation by the Appellate Division of the New York Supreme Court of the principle of the owner's liability if he fails to select a competent architect. Attention was called to this interpretation of the law at the meeting of the Architectural League held on March 6th, at which the licensing question was discussed, and since that date the court has again ruled along the same lines. What guarantee has the owner now that he is selecting a competent architect?" The best illustration in this number is of the Memorial

Building, Princeton, N. J., Messrs. Parish and Schroeder, architects—a simple little Gothic-spired structure, which is entirely satisfactory. There are also several small houses on the right lines, and also several atrocious specimens of the modern French and German schools.

The Brickbuilder (Boston, Mass.) for April contains well-illustrated articles on the brickwork of Southern France, and in the Royal chateaux of France; and an article on church architecture in materials of clay, which is certainly not enhanced by the illustrations of churches in this material. The designs in the competition for the Carnegie Library, Atlanta, Ga., are all of considerable merit. The winning design by Messrs. Ackerman and Ross has a good plan and a simple Classic elevation, and is certainly superior to the others in every respect. The Law School at Pennsylvania University is an extremely ugly jumble of Classic styles, with senseless decoration.

The Scientific American, Building Edition.—What a blessing is the necessity for economy. This reflection seems always to be called to one's mind when looking through the pages of this magazine. The exteriors of the small houses erected by the everyday American architect seem often quite respectable and passable, and if just a little proportion were observed, would be quite pleasing. But what a contrast is the interior, where the rigid economy exercised on the front has given the chance for a little lavishment inside. Then we have examples of all the modern American want of taste and refinement. This present number contains nothing of especial interest.

Carpentry and Building (New York) for June has articles on trusses for flat roofs, the art of wood turning, estimating for stone-work, notes on the Paris Exhibition, and notes on practical work of various kinds, with numerous illustrations. A number of designs of shops, small houses, &c., with details, are also given.

La Revue de l'Art Ancien et Moderne for May contains illustrated articles on the decoration of the prayer book of the Constable Montmorency in the Condé Museum; on the work of that remarkable and gifted artist, Alphonse Legros; on metal-work and the historical exhibition of French Art at the Paris Exhibition; and Rosa Bonheur and her art.

The Journal of the Royal Institute of British Architects.—In the issue for May 12th an illustrated paper on ornamental lead and lead-casting is contributed by Mr. F. W. Troup, who has for the past five or six years devoted considerable time to the study of the methods of using and working in lead, giving his attention more to the ornamental side of its employment than to the practical side in water and sanitary work. Mr. Troup ends his paper with the following excellent advice: "I would venture to say to all students of our traditional crafts: Study the old, but do not blindly copy it. First master the meaning of the methods employed. Not till then can you with certainty solve modern problems nor adapt the old methods to meet modern conditions." In the issue for May 26th the paper read by Mr. J. M. Brydon on "The Work of Professor Cockerell, R.A.," is given in full, with illustrations, and Mr. W. Dunn contributes an article on the bending stresses in flat rectangular concrete floors.

The Antiquary this month contains nothing of special interest. The chief articles are on aboriginal American writing, the ancient Ribbleside crosses, and the Ribchester excavations last year.

The Birmingham Magazine of Arts and Industries for May is called an electrical number. We presume the editor meant that the number deals with articles and plant used in connection with electricity. Articles on the electricity supply of Birmingham and on the Edison and Swan United Electric Light Company, Limited, and its work are given, with shorter ones on Pitmaston, the home of Sir John Holder, Bart.; the Birmingham Photographic Exhibition, 1900; and the new Union Mill, Birmingham.

Die Kunst.—The first place in the May number of this magazine is given to an illustrated description of the Munich "Künstlerhaus"—the new club and assembly rooms which have recently been built for the artists of that city. The illustrations of the interior decorations, of which a number are given, show that the work has been carried out on a scale of lavish magnificence worthy of an English hotel or the mansion of an American millionaire. But from an artistic point of view the result is deplorable; every square foot of wall and ceiling seems to be covered with ornament, often of the vulgar kind, as though the artists thought there would be something indecent in leaving any part of the surface uncovered. The extravagance of this "Künstlerhaus" is, however, as nothing compared with the details of some other recent buildings in Munich, of which illustrations are given in the same number. The entrance gate to the "Elvira" studio—a riotous orgy of writhing metal—and the façade of the same building with its blotches of meaningless and shapeless plaster ornament, must be seen to be believed. If such examples were really typical of modern German decorative work, one would be forced to the conclusion that German artists have lost all sense of artistic restraint, and in their frantic efforts after novelty have become quite indifferent to considerations of beauty. Several accounts of spring picture shows are included in this number, and an appreciative article on the Polish artist, Peter Stachiewicz, is illustrated with some excellent reproductions of the artist's drawings.

Architekturwelt has a coloured frontispiece illustrating the entrance hall of a hunting lodge. The article on "The New High Buildings in Berlin," is concluded in this number. A recently opened national school in Berlin is fully illustrated with plans and details which should be interesting to architects who work for English school boards. The Paris Exhibition again occupies a prominent place in the magazine, a fully illustrated article being devoted to the sculptures on the façade of the German house. Several examples of recent domestic architecture are illustrated; and the number contains as usual several illustrations of modern German furniture, some of which—notably a sideboard by Fried. Thierichens—being comparatively simple and unaffected, is much more pleasing than are many of the products which editors of German art magazines seem to take delight in illustrating.

The Writings of John Ruskin in their entirety are about to be published in French.

National Library at Florence.—A site for this building has at last been chosen; it is 10,000 square metres in area, and is near the Church of Santa Croa. The cost of the library will be between £80,000 and £100,000.

Court of Common Council: the new Sessions House.—At last Thursday's meeting of this Council a report was brought up from the City Lands Committee on the new sessions house in the Old Bailey. The Committee had six designs under their consideration and recommended the adoption of one of them. The Court originally had fixed the price to be expended on the building at £225,000, but Mr. Pryke said that they would have to spend the sum of £265,000 owing to the increased price of material. Mr. Morton pointed out that the stipulated expenditure should not be exceeded, and moved the adjournment for the consideration of the report; after some further discussion this was agreed to. The portion of the prison of Newgate which the Government are to hand over for the enlargement of the site of the sessions house will not be vacant before September in next year. It was decided to refer to the Streets Committee to consider the desirability of constructing subways for pedestrians at the junction of Newgate Street and Cheapside. It was also decided to inform the London County Council that the Corporation was not prepared to give its consent for the introduction of a Bill for the construction of tramways in the City.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Iron and Wooden Bungalows.

POST BRIDGE, DEVON.—T. L. writes: "Could you tell me the name of a firm who make bungalows of wood and iron construction complete and ready for fixing?"

Messrs. Isaac Dixon and Co., Windsor Iron Works, Liverpool; W. Harbrow, South Bermondsey Station, London, S.E.

Extracting Oil from Stone.

SEAFORTH.—PRETORIA writes: "What will extract engine-oil from dressed Runcorn stone? Pearl ash and whiting have been tried, but without success."

I do not think it possible to remove the oil stains without destroying the face of the stone. Spirit of salt poured on the stain and rinsed off with clear water may partly remove it.

G. H. J.

Municipal and County Engineers' Examination.

LLWYNTPFA.—ALPHA writes: "I shall feel obliged if you will kindly give me a list of books (not too expensive) suitable to study for the above examination, particularly those dealing with the engineering and municipal work."

This examination is not one that can readily be prepared for from books. What is needed is a practical acquaintance with the various subjects. In the branches named, "Law's Civil Engineering" (Crosby Lockwood, 7s. 6d.) and "Boulnois' Municipal and Sanitary Engineer's Handbook" (Spon, 15s.) are the most suitable.

HENRY ADAMS.

Tours in Belgium.

BRIXTON, S.W.—A. C. L. writes: "I and a friend wish to spend a week in Belgium, and we should be obliged if you would let us have a list of the best places to visit during that short period; also any particulars as to hotel accommodation would be acceptable."

Much depends on whether your chief object is to study architecture or to enjoy natural scenery. If the former, you could very profitably confine your attention to the cities of Flanders—Ghent, Bruges, Liege, Ypres, Malines—all of which are very quaint and interesting; if the latter, you should make for the Ardennes, visiting Dinant, Rochefort (for the wonderful grottoes of Han), La Roche and—if time allowed—Echternach and Diekirch in the Luxembourg Ardennes. A good way to see a little of both the cities and the country would be to take some such itinerary as this: Harwich, Antwerp, Malines (don't omit to break the journey at this quaint old town), Brussels, Namur, Dinant, Rochefort. Several tourist agents, like Cook, Gaze, or Lunn, will supply full particulars about the hotels, which are good and very cheap.

Books on Monastic Buildings.

DONCASTER.—MOSS writes:—"As a constant reader of your interesting paper, may I venture to ask if you could kindly give me the name of any book (not too costly) setting forth the architectural and structural peculiarities of the various monastic orders, the ruins of whose buildings are still to be found in this country. I believe there are certain well-defined differentia by which the buildings of one order can be distinguished from another, but I have hitherto failed to discover what they are."

The best books our correspondent can study are Prior's "History of Gothic Art in Eng-

land," with 340 illustrations, price 31s. 6d. net; "English Church Architecture," by George Gilbert Scott, F.S.A., price 26s. post free; and Walcott's "Church and Conventual Arrangement," price 9s. 6d. post free. The last is illustrated by a series of ground plans and plates of arrangements of churches in different countries and at successive periods, and of the conventual plans adopted by the various orders. Mr. B. T. Batsford, 94, High Holborn, W.C., will supply the books.

Property Sales.

LONDON, S.E.—R. A. C. writes: "Three years ago I instructed a firm of auctioneers to sell a house, gave them full particulars, and arranged with them as to the reserve price. They submitted a draft of the sale which I approved with one or two minor alterations. They also wrote to know who should represent me at the sale and I gave a solicitor's name who had acted previously for me. The property did not reach the reserve and was withdrawn. A few days ago I received an account from the solicitor to which I replied. In reply I received a letter from them, of which I enclose extract (not reproduced). I should be very much obliged if you would inform me if they are right in their contention, and if their claim, taking into consideration what I have done in the matter, is correct. Taking into further consideration that within eighteen months of the sale the same firm had prepared the title to the property (which is a freehold one), the claim seems out of all reason. With the exception of their writing to me to know the reserve, no other communication passed between us, and this enquiry was absolutely unnecessary, as I had previously arranged with the auctioneer as to the amount. If I have no case, of course their account will be paid, but I should like to know just how I stand as regards legal position."

The charges do not seem to be recoverable. In order to sustain their claim, the solicitors must show that they were retained to do the work, and that they did it. It would not appear that they could show either the one or the other. They are not correct in saying that they have only charged one half of the amount allowed by the scale in the Solicitors' Remuneration Act, which is "For conducting a sale of property by public auction, including the conditions of sale, when the property is not sold, then on the reserved price 10s. per cent." This in the present case would come to £1 19s., but there is a minimum of £5 allowed in all cases. If the solicitors, therefore, claim only one half of the scale charges, they should be satisfied with £2 10s., instead of £3 15s.

H. P. B.

LONDON'S LATEST HOTEL.

FOR some time past many persons have been watching the completion of that great new building in Russell Square, the Hôtel Russell. The Bedford Estate, of which this square is a part, has never been disfigured by careless management. The original houses, it is true, have but little architectural pretension; they are plain, drab-looking buildings, with an air of solidity and comfort rather than of refinement. Now the architect has been abroad in Bloomsbury, and old houses are being rebuilt, remodelled, or modernised with new ornamental fronts. The Hôtel Russell comes to complete the transformation. The site extends from Guilford Street to Bernard Street, and, as it has an angle, presented some difficulties which have been satisfactorily overcome by the architect, Mr. Fitzroy Doll, F.R.I.B.A. The design is after the German Renaissance style, light red brick and terra-cotta having been used, and a variety of soft yellow tints introduced. A striking feature of the main elevation is an arch which is run up to the fifth floor over the doorway, while immediately above the entrance are sculptured figures, by Mr. W. H. Fehr, of England's great Queens, Elizabeth, Anne, Mary and Victoria. At the top of the colonnade, which runs round the building, are medallions with the arms of the chief countries of the world picked out in

various colours, while sculptured heads of leading English statesmen are placed in niches between the principal windows on the Guilford Street frontage. On passing the doorway you find yourself in a magnificent marble hall, which commands a view through the glass-covered palm house and winter garden that forms the centre of the building to the banquetting hall beyond. A broad staircase rises from the hall, with marble arcaded columns leading to a gallery on the first floor, where the spandrels are panelled over arches and ornamented with figures in bas-relief.

To the right the whole frontage between the main entrance and the Guilford Street corner is occupied by a reception and reading room, which is broken up by a large recessed fireplace with projecting seats and large columns, round which writing tables are placed. This room is wainscotted in oak with high panelling. Above the upper frieze, on a dark background, are portraits by Reynolds, Lawrence, and other well-known painters, while over the mantelpiece is a large painting by Hayden. There are book cases under the panelling to the left of the fireplace, and the large bay windows which look out on the gardens in Russell Square contain writing tables. The main frontage to the left of the entrance on the ground floor is taken up by a smoking room, a billiard room, and a business room for business men—a feature which will be welcomed. The smoking room has panelled oak wainscoting, and is arcaded on one side and broken up by screened seats.

Turning now to the opposite or Guilford Street frontage of the hotel, it is found to be occupied chiefly with a handsome dining room. The lower part of the walls are lined with warm-coloured marbles, above which is a panelled frieze. The room is divided by two rows of marble columns of the same warm tone, while the upper parts of the columns contain niches with sculptured figures. Between the dining room and the reading room is a small room, with separate entrance and vestibule, for the use of private dining parties.

Forming the back part of the building on this floor is the great banquetting hall, which is in the French Renaissance style, with large, well-proportioned piers on each side, surmounted by caryatides supporting beams which stretch across the ceiling. At one end of this spacious and gorgeous hall is an arcaded gallery, with wrought-iron balustrading, which may be used for the orchestra. Adding further to the decoration is a raised alcove at the back of the room filled with plants and flowers, and a frieze of large mirrors. At the north end of the banquetting hall there is still another dining room. The importance of the social side of hotel life has been recognised and provided for in the central winter garden, a kind of lounge or foyer. It is a few feet lower than the surrounding rooms, and round it are flights of stairs—of a few steps—leading to and from the entrance hall, smoking and billiard rooms, dining room, &c. The floor is laid with red and white marble, covered here and there with rich Turkey carpets. Terraces under the same glass roof are at each end, and a wrought-iron balcony runs along by the corridor which separates the winter garden from the entrance hall.

On the first floor of the building are a beautiful lounge and a number of suites of rooms, in most cases with bathrooms attached. There are similar suites on the second floor. There is a great variety of single and double bedrooms, furnished in the most comfortable style, the bedrooms in the corners of the building having a bath very neatly tucked away in the alcoves formed by the turrets. The hotel contains altogether about 700 rooms. There are four sets of lavatories on each floor, one on each side of the building, and all the sanitary fittings are of the latest pattern. The whole building is well ventilated and its situation and construction provide that all rooms are remarkably well lighted. A most perfect system of fire-preventive appliances has been installed in the hotel by Messrs. Merryweather and Sons, engineers, of Greenwich, and all the furnishings have been supplied by Messrs. Maple and Co.

Correspondence.

The Southampton Disaster.

To the Editor of THE BUILDERS' JOURNAL.

HOLBORN, E.C.

SIR,—Many of the newspaper reports of the accident at the new cold storage premises at Southampton, which took place on May 28th, have given the impression that the permanent buildings collapsed. As the agent for the Hennebique patent, according to which the building is being constructed, I trust that you will allow me space in which to contradict this wrong impression. The true facts of the case are as follows:—The contractors had erected a large timber workshop to contain the vertical moulds in which the ferro-concrete piles are cast. At the time of the accident there were about three hundred finished piles, 43ft. long, in the moulds, weighing about 1,200 tons. Just as the men had left the works at dinner-time the workshop collapsed, carrying with it the ferro-concrete piles which it contained. Most of the piles were still green and were consequently broken by their fall. The accident occurred about 200yds. from the permanent building now in course of construction, which is not injured in any way. The workshop had been erected on made ground principally composed of chalk, and the accident is attributed to a sudden subsidence of the ground. The workshop had been in use for about twelve months.—Yours faithfully,

L. G. MOUCHEL,

General Agent for the Hennebique,
Patents in the United Kingdom.

Public Health (London) Act, 1891.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, E.C.

SIR,—May I draw your attention to Ch. 76, Sec. 5, of the above Act which appears to require radical alteration in some of its subsections. An owner of a number of well-built cottages in the Ladywell district, finding his property being damaged by undesirable tenants, and experiencing difficulty in evicting them, unwisely applied to the local authorities to issue a closing order. The tenants under this were duly ejected, and the owner then consulted me with the result that the property was thoroughly restrained and put into substantial and decorative repair at a large expense, making it approximately in accordance with the requirements of the London Building Act, 1894. On application to the magistrate for a decision order he refused to act without the consent of the local authorities.

There is no word in the Act permitting him to take this stand, but simply an inference that he judge the case sitting as a Petty Sessional Court, and my client, being a poor man, shrinks from facing the expenses of a mandamus to compel him. The local authorities refuse their consent, and give no reason for their action. The Act permits them to decline giving any specification or information as to what they consider necessary to render the premises habitable, thus making them masters of a situation frequently created to further their own ends, which are not always above reproach.

It would appear, therefore, that the following amendments are urgently needed:—(1) That there should be served with the closing order a specification of what the local authorities consider necessary to put the property into habitable repair; (2) that if they consider it impossible to make the property habitable, the magistrate should be compelled to judge the case on its merits without previous reference to them.—Yours obediently,

JOHN W. RHODES.

The Late Sir Gilbert Scott, R.A.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reference to Mr. Hems' letter on page 309 of your last issue, it matters little or nothing whether or not I am old enough to remember the late Sir Gilbert Scott personally. If Mr. Hems is curious on that point he can

consult the oracles—that is to say, the books of reference—which contain biographical particulars of the eminent men of the time! That, at any rate, I had not what would have been the critical disadvantage of Scott's acquaintance, either as a friend or in the way of business, is quite certain; and right glad am I that this is the case, for, as Mr. Hems ingenuously and unconsciously shows, the smoothly-running business arrangements of Scott's office, with its staff of "thirty-six assistants," could, in the eyes of a business man, whose time, like that of Mr. Hems, is valuable, do much to condone a certain artlessness and mechanical style. I have no quarrel with Mr. Hems in his estimate of Sir Gilbert Scott's business habits, and he should have none with me on the score of Scott's artistic endowments. It is only in point of view that we are at variance; but then, as we see, point of view is everything. Had I been placed in business relations with Scott, I also—Saul among the prophets—should doubtless have had occasion to thank Scott for time saved and favours conferred, to the damnation of my own artistic perceptions.

Here we have explained much of the well-meaning but misleading log-rolling that characterises this era. Everyone knows everyone else, and each owes the other something. Mr. Hems must owe Scott's memory much, for he goes the whole way, I observe, and tickets the arch-restorer "the greatest architect of the nineteenth century." Now I submit in fear and trembling that if we drop one little word in between "greatest" and "architect"—the word "commercial"—we shall have a better definition, while at the same time, in relegating Sedding and Street to their purely artistic domain, we shall be placing them where they would be, and doing no one any harm.

Scott was really great in two things, besides in the rapacity for which, as Mr. Hems acknowledges, "nothing was too little—nothing too big." He was great in organisation, by which, as shown by Mr. Hems, his bald and unconvincing designs were repeated by a staff of ghosts large enough for a railway company's drawing-office, while those brilliant but unbusinesslike men, Sedding and Street, mostly did their own drawings; and he was really great as an engineer. He could manipulate a hydraulic ram with the greatest of discretion and effect, which those other fellows could perhaps not do; but he could not, and did not, work as they did, greatly to the delight of the appreciative, and the dismay of the merely businesslike.—Yours sincerely,

CHARLES G. HARPER.

Builders' Notes.

Roof-stripping at Hounslow.—For stripping the lead off the roof of Whitton Park Towers, at Hounslow, and doing damage to the extent of £100, four men were recently sent to prison, two for twelve months and two for eighteen months; all with hard labour.

Machine Carving.—The chief object of interest in the exhibit at the Paris Exhibition of Messrs. A. Ransome and Co., Ltd., Stanley Works, King's Road, Chelsea, is the "Marbut" Rapid Moulding Carver, which produces perfectly finished carved mouldings with incredible rapidity. The machine will carve mouldings up to 8in. wide in any kind of wood, and of various patterns. All the refuse made by the machines of various kinds exhibited (which number seventeen) is automatically drawn away by Messrs. Ransome's pneumatic conductor.

Reduction in Prices in the Slate Trade.

—At a meeting of quarry proprietors, held at Portmadoc last week, considerable discussion took place upon the question of how best to cope with the competition in the slate market caused by the importation of French and American slate. Some employers advocated a reduction in wages, but considerable opposition was offered to this, and the idea was dropped. It was reported that slates had been stocked at Portmadoc for some time past, and that the

competition was felt more keenly at that part than at Carnarvon and Bangor. It was eventually resolved to knock off the five per cent. premium on all sizes and qualities, and to make a further reduction of five per cent. in mediums, 24 by 14 and 22 by 11, and in all seconds. It is not at present proposed to make any alteration in the price of Carnarvon slates.

Fire Tests with Partitions and Doors.

We have received publications numbered 37 and 49 from the British Fire Prevention Committee. The former deals with a test made with a partition erected by the "Gypsin" Brick Co., Ltd., of London and Paris. The partition was 7ft. 9in. high and 10ft. wide, and was laid on a single course of stock bricks bedded in cement on the floor. The following is a summary of the effect:—A portion of the coating of fireclay on the fire side of the partition fell during the application of heat. A further portion fell off on the application of water, as also most of fireclay pointings to the joints. In no place had the fire passed through the partition. The bricks were sodden with water and easily impressed, although no effects of the fire were apparent except for some hair cracks on the fire side. The temperature of the outside face of the partition was at no time sufficient to ignite a match.—The latter of the two publications mentioned deals with a fire test made with a 2½in. door of Archangel deal, constructed in three thicknesses, and a similar door of Quebec pine. The result was as follows:—In thirty-nine minutes flame appeared over the top of the deal door intermittently. In forty-two minutes flame about 12in. long appeared down the west side of the same door. In fifty-two minutes no flame had come through the pine door, although much smoke came from the joints, and the wood around all the bolts and nails was much scorched. In fifty-five minutes flame came continuously through the upper portion of the deal door. In sixty minutes flame came over the top and through the upper part of the pine door. In sixty-five minutes the upper portion of the deal door was considerably burnt, and flame was seen through several small holes burnt in the lower portion of the door. In seventy minutes, after water had been applied, the two inner thicknesses of the pine door were found to be practically burnt away and the outer thickness (which was for the most part in position) much damaged.

London County Council.—At last week's meeting of the Council the Water Committee recommended that a Bill be promoted by the Council in the next Session of Parliament to provide that in the event of a Bill being passed for the purchase of the water companies' undertakings the clauses in the several Acts known as the "sterilisation" clauses be deemed to be in operation up to 1908. They also advised that they be authorised to recommend applications to Parliament in regard to water supply, if thought necessary, at any time not later than November 13th next. After discussion this was agreed to.—The Improvements Committee reported that the Southampton Row improvement was being undertaken without any contribution from the local authority. Having regard to the fact that the widening of High Holborn was necessitated entirely by the requirements of the heavy general through traffic in London, they did not think that it would be reasonable, in the case of this improvement, to expect any such contribution. When the new street from Holborn to the Strand, 100ft. wide, was completed, and when the widening of Southampton Row to 80ft. was carried out, the part of High Holborn affected by the present proposal would adjoin one of the most important crossings in London. A width of less than 70ft. was inadequate for the needs of the traffic in that part of High Holborn, having regard to the frequent stoppage of the east and west traffic in order to accommodate the north and south traffic passing along Little Queen Street and Southampton Row. In those circumstances they had no hesitation in recommending the Council to take advantage of the present opportunity for carrying out the improvement by continuing the widening of High Holborn to 70ft. between Nos. 107 to

113, both inclusive. The report was approved. The Council approved estimates amounting to £53,000 for the equipment of the new lunatic asylum at Horton. This sum includes £35,094 for furniture and fittings.—Upon the recommendation of the Highways Committee, it was decided to apply to Parliament for powers for the Council to double the tramway lines in Battersea Park Road, Bermondsey New Road, York Road, Battersea, Albert Embankment, Wandsworth Road, and the new street from Bermondsey New Road to Tooley Street, authorised by the Tower Bridge Approach Act of 1895. The estimated cost was stated to be £43,200. Subject to the necessary Parliamentary powers being obtained, the Council decided to pay half the cost of acquiring 42½ acres of land for the extension of Brockwell Park.

Derby Municipal Buildings: A Sub-Contract Dispute.—On Wednesday last the matter of an arbitration between George Wallis and Henry Vernon came before Mr. Justice Darling and Mr. Justice Bucknill, sitting as a Divisional Court in the Queen's Bench Division of the High Court. Mr. McCaigie said the dispute between the parties arose under these circumstances:—In 1894 Vernon entered into a contract of an important character with the Derby Corporation to carry out certain large extensions of certain municipal buildings—a technical college. The contract was in writing, and had a large number of elaborate provisions, but the only point he thought it necessary to mention was that the contract, which amounted to nearly £20,000, was a lump sum contract. Vernon undertook to perform all the work which was specified for a lump gross sum. After he had made that contract he entered into a sub-contract with Wallis relating to the whole of the stonework, which was to be supplied in connection with this extension (dated November 26th, 1894), for £3,500, subject to measurement. Mr. Wallis claimed that sum, but Mr. Vernon was only willing to pay by piece for the work actually done. The matter was referred to arbitration, and Mr. Vernon's counsel raised two points which the arbitrator had submitted to the Court in the form of a special case. The first point was, that before Wallis could require Vernon to pay him the balance he (Vernon) had a right to require Wallis to show that the whole of the work had been measured up, and that the payments made had, *prima facie*, only been payments on account. The second point was that there were two conditions precedent with regard to any deviation from the drawings or any extras—namely, that they must be ordered in writing and taken account of at the time the work was executed, and that plaintiff must show that had been done before he could recover. After hearing all the arguments, their lordships gave judgment. Mr. Justice Darling said the arbitrator had asked the Court for answers to three questions. To the question whether on the true construction of the agreement Wallis was entitled to recover the net sum, subject only to deduction for authorised omissions, in his opinion the answer was, Yes. In the question whether Vernon was entitled to require the whole work to be measured and to pay Wallis only on the result of the measurement, the answer was, No. To the question whether Vernon was entitled to resist payment of the amount of Wallis's claim for extra work, on the ground of non-compliance with the alleged conditions precedent in the agreement, the answer was, No. Mr. Justice Bucknill agreed.

The Geological Survey.—The President of the Board of Education has approved of a committee to enquire into the organisation and staff of the Geological Survey and Museum of Practical Geology; to report on the progress of the survey since 1881; to suggest the changes in staff and arrangements necessary for bringing the survey in its more general features to a speedy and satisfactory termination, having regard especially to its economic importance; and, further, to report on the desirability or otherwise of transferring the survey to another public department.

Surveying and Sanitary Notes.

Mr. J. E. Sharp, of Keighley, has been appointed surveyor to the Otley District Council at a commencing salary of £150 a year.

The late Mr. Peter Lawrence.—The announcement of the death of Mr. Peter Lawrence, surveyor, will come as a surprise to his friends in Edinburgh. He received his professional training in a Glasgow office, and then joined his father, who was in the same business.

Leicester Sewage Disposal.—At last week's meeting of the Leicester Town Council it was decided to open negotiations for the purchase of the Beaumont Leys Sewage Farm, and to carry out a sewerage and sewage disposal scheme for the district of Belgrave at a cost of £85,840.

Holborn Board of Works.—Three tenders were received for the repaving of certain portions of the footways in Chancery Lane, Red Lion Street, Charles Street, and Hatton Garden. The surveyor said, at last week's meeting of this Board of Works, that the lowest tender was £1,428 in excess of the estimate, which was prepared eighteen months ago. It was decided to reject the tenders and readvertise.

Landslip at Delabole: Fall of 70,000 Tons.—At the Delabole Slate Quarries a landslip recently occurred, when, it is estimated, about 70,000 tons of solid rock and "harder" came away. Only three years ago there was a similar fall in another part of the quarry, and 120,000 tons of material then came down. On the present occasion the precautions taken were happily successful in averting loss of life and minimising the damage.

Euston Station Extension.—At last week's meeting of the St. Pancras Vestry the chairman of the Parliamentary Committee (Mr. W. H. Matthews) said, with regard to the proposed extension of Euston Station, that the company asked, and the Council was apparently prepared to agree, that the former should be allowed to build upon the eastern inclosure of Euston Square, conditionally that 10ft. along the entire line of open space should be added to the width of Euston Road, and the western inclosure, thus shorn, should still be preserved as an open space, and also be available for the public use. On the other hand, the Vestry took their stand upon a private Act of Lord Southampton, which required both inclosures to be maintained as open spaces, although barred to public access; in fact, the Vestry adhered to the status quo. The Committee of the House of Commons were with the Vestry in its contentions, and hence there was every likelihood of Euston Square remaining fully open as at present.

Surveyors' Institution.—At the annual general meeting of this institution held last week, the president, Mr. T. M. Rickman, in the chair, it was announced that Mr. John Shaw had been elected as president for the ensuing year. The thirty-second annual report of the Council stated that the Institution had at no previous period been more prosperous than now. The number of members on the roll was 3,098, and there had been a net increase during the past year of 103, of whom 71 were in the class of Professional Associates. The receipts for the year amounted to £18,695, as against an expenditure of £18,316. Dividends showed a reduction, owing to the realisation of investments to meet the outlay on the new premises, the sale of stocks for this purpose having amounted to £9,000. The number of candidates for the Professional Examinations of 1900 was 325, and of these 193 had been successful, showing a percentage of passes of 59.38; but 56 others had satisfied the examiners in their work as a whole, though they had failed to pass in their "typical" subjects, and were eligible for re-examination.

Bricks and Mortar.

APHORISM FOR THE WEEK.

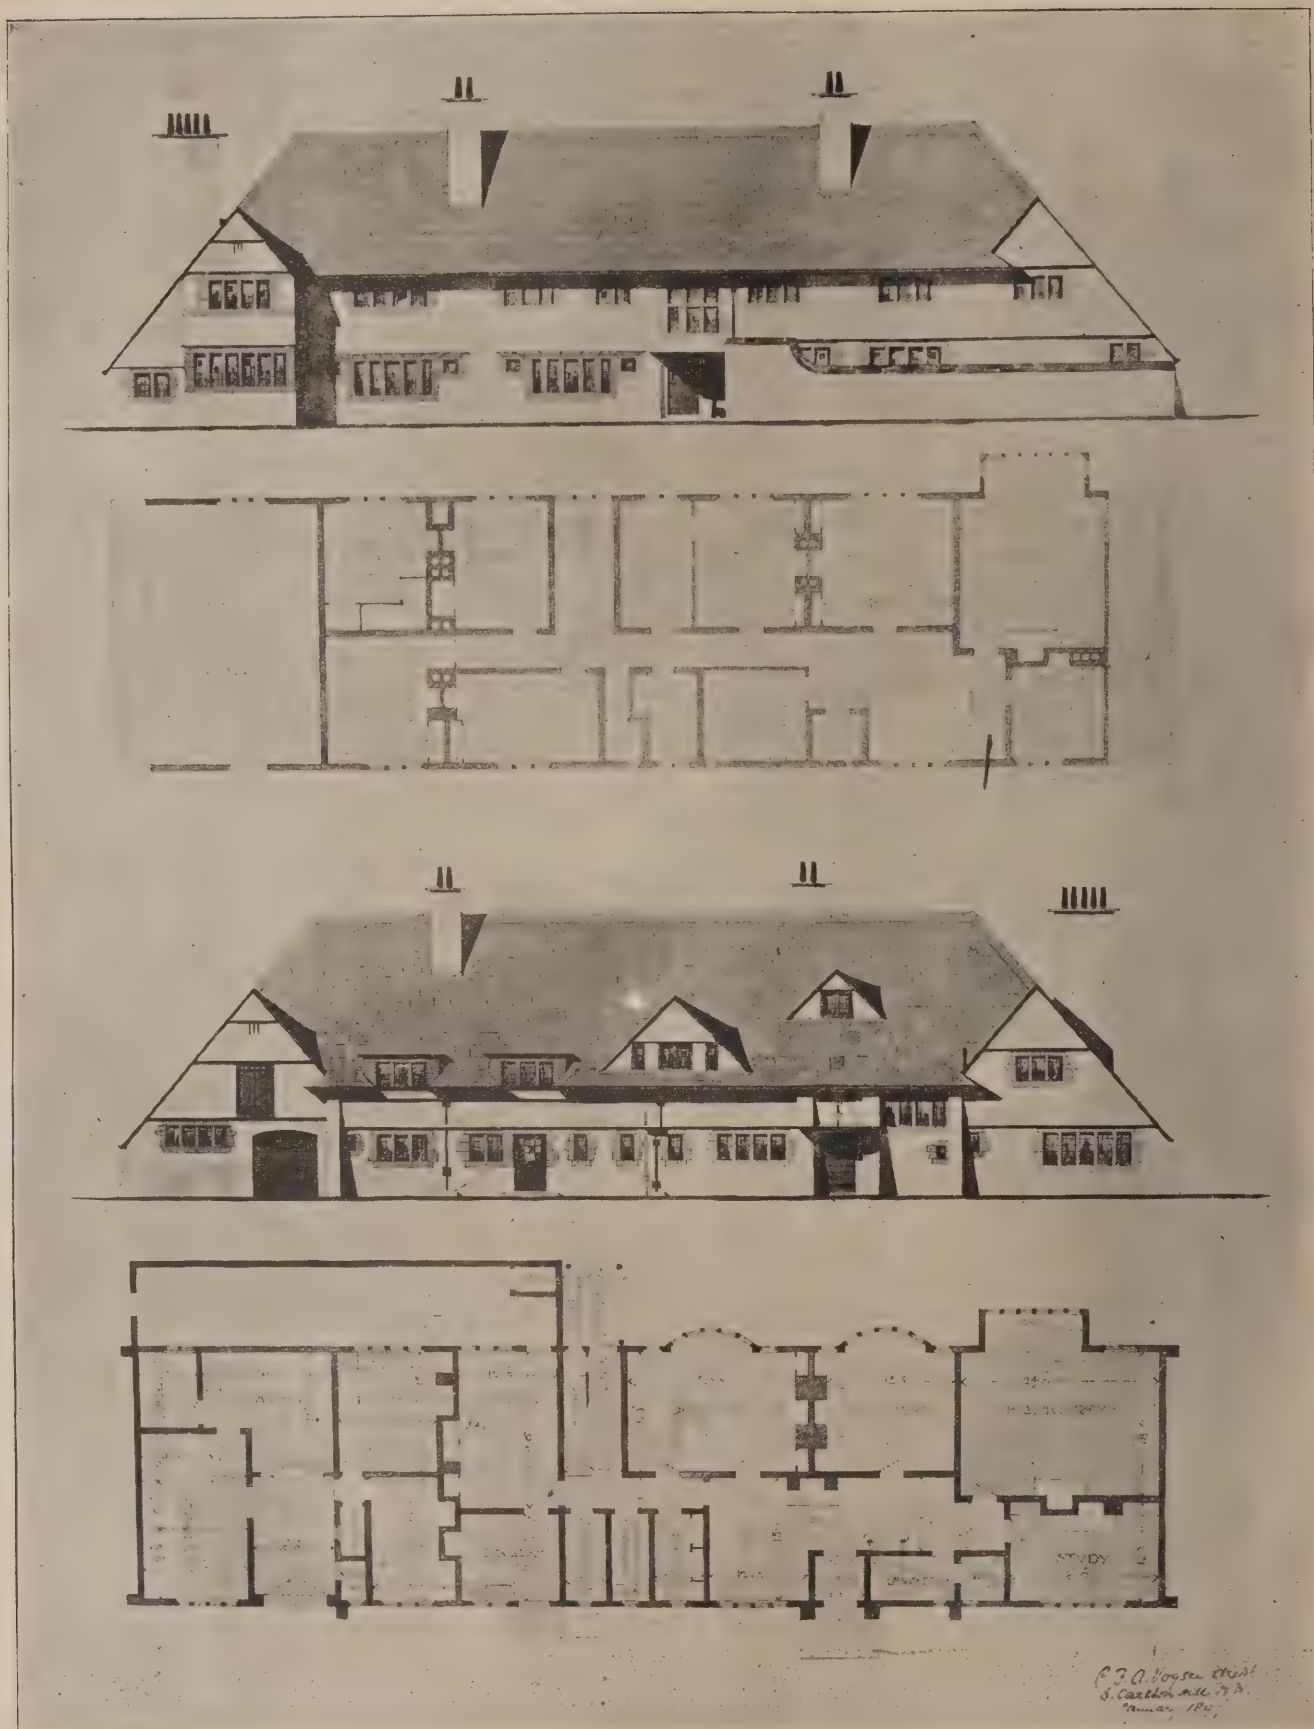

"Architecture, again, though it has its own laws—laws esoteric enough, as the true architect knows only too well—yet sometimes aims at fulfilling the conditions of a picture, as in the Arena chapel; or of sculpture, as in the fluted less unity of Giotto's Tower, at Florence; and often finds a true poetry, as in those strangely twisted staircases of the chateaux of the country of the Loire, as if it were intended that among their odd turnings the actors in a theatrical mode of life might pass each other unseen; there being a poetry also of memory, and of the mere effect of time, by which architecture often profits greatly."—W. PATER.

Our Inset Sheets.

The new church of St. John the Baptist at Newport, Mon., was recently consecrated by the Bishop of Llandaff. The illustration shows it from the north-east side. The tower is not built, but the foundations are laid for it. The church has nave, with aisles, and chancel with aisles, of which the one on the south side is fitted as a chapel. There is a sacristy on the north aisle of the chancel. The organ is in the north side of the chancel. The church has two entrances on the south and one on the west, and there is a large vestry in the basement. The church accommodates 700 persons. The material used is a red walling stone, with Bath stone for the windows, &c. The roofs are covered with stone grey-slates, and the timbers inside are painted. The chapel roof is much carved and illuminated in colour and gold. The floor of the chancel is in marble mosaic, and the font is richly sculptured. The remainder of the fittings are for the most part temporary. Heating is by hot water and lighting by electricity. The work has been carried out by Mr. W. A. Linton, of Chepstow Road, Newport, builder, from designs by Mr. F. R. Kempson, of Hereford and Cardiff. The cost up to the present has been £8,000.—The house proposed to be built on Tooting Beck Common, S.W., was abandoned because the architect, Mr. C. F. A. Voysey, would not increase the height (9ft.) of the rooms without entirely altering the character of the building. Brick, cement rough-cast, was to be used for economy, and the roof was to be of green Westmorland slate.—The "gesso" panel by Mr. F. Hamilton Jackson is an illustration to his article on page 319.—The house at Storrs, Windermere, has been designed in the spirit of the old Westmorland work, and is constructed of native stone walling, cement dashed externally, and with roofs of green local slates and stone ridges. The entrance is framed in oak, with side lights and swelled pillars under a plain frieze and cornice. The position of the lake, which is overlooked by the principal rooms, has largely influenced the design, and the angle windows are arranged primarily with the object of obtaining a more extended view. The work is being carried out by local tradesmen under the supervision of the architect, Mr. Joseph Pattinson, of Windermere.

Italian Restorations. On page 234 of our issue for May 2nd last we printed an extract from a letter written by Mr. Charles L. Eastlake to the "Times" newspaper with reference to architectural restorations in Italy. Mr. Sydney C. Cockerell, in a letter to the same newspaper, now comes forward with a reply, consisting mainly of an extract from "Fors Clavigera," in which Ruskin deals with the chapel of Santa Maria della Spina at Pisa. In 1872 he wrote: "It was some comfort to me, that second of May last, at Pisa, to watch the workman's ashamed face as he struck the old marble cross to pieces. Stolidly and languidly he dealt the blows, down-looking—so far as in any wise sensitive, ashamed—and well he might be. It was a wonderful thing to see done. This Pisan

chapel, first built in 1230 was a shrine like that of ours on the Bridge of Wakefield. In the year 1840 I first drew it, then as perfect as when it was built. Six hundred and ten years had only given the marble of it a tempered glow, or touched its sculpture here and there with softer shade. But the last quarter of a century has brought changes and made the Italians wiser. British Protestant missionaries explained to them that they had only got a piece of blackberry stem in their ultramarine box. German philosophical missionaries explained to them that the Crown of Thorns itself was only a graceful metaphor. French Republican missionaries explained to them that chapels were inconsistent with liberty on the quay; and their own engineering missionaries of civilisation explained to them that steam-power was independent of the Madonna. And now in 1872 rowing by steam, digging by steam, driving by steam, here, behold, are a troublesome pair of human arms out of employ. So the engineering missionaries fit them with hammer and chisel, and set them to break up the Spina Chapel. A costly kind of stone-breaking, this, for parishes to set paupers on! Are there not rocks enough of Apennine, think you, they could break down instead? For truly, the God of their Fathers, and of their land, would rather see them mar His own work than His children's."

A.A. Summer Visits.

THE Summer Visits Committee of the Architectural Association have arranged for the on-

coming session the usual series of six visits to places of architectural and archaeological interest, within an accessible distance of the Metropolis. During the course of the session the list of visits, as proposed, touches a series of edifices of very considerable merits. The following *résumé* will show, with the date of each, the places it is proposed to inspect:—June 16th, The Deepdene, Dorking; June 30th, Christ's Hospital, Horsham, an immense set of buildings of very great architectural and constructive interest by Mr. Aston Webb, A.R.A.; July 14th, an all-day visit, Mr. C. Eames Rempes' house, Hayward's Heath, and Cuckfield Place; July 28th, Stowe House, Buckingham, a magnificent seventeenth and eighteenth century mansion, possessing a very grand interior, and with fine old gardens of great size; the church will also be inspected; this will be an all-day visit; August 18th, Mere-worth House, Kent, an enlarged copy of the celebrated villa at Vicenza by Palladio. On September 1st it is proposed to visit either Hatfield House, Tring House—one of Wren's mansions—or the Chequer's Court, near Ward-over. This visit, however, has not yet been definitely arranged. As these visits and the places visited are extremely pleasant and interesting, we hope to publish an account of each in due course, supplemented by some sketches, or photographs, where possible.

The War Office Barracks.

THE War Office has decided to hasten the erection of the new barracks on Salisbury Plain, so that the 19,000 troops who will

go under canvas during the summer will be housed in temporary corrugated iron buildings by next September. Already thousands of tons of materials are on their way to the site. The walls will be of corrugated iron, which lends itself to rapid construction, but they will be raised upon substantial brick bases, and the floorings will in every case be of 4in. concrete on 6in. hard core, the concrete being covered with 1½in. wood floors. The iron will be covered internally with match-boarding, with felt lining between. These buildings will be of every size, and will serve many uses, ranging from commanding officers' quarters down to the ever-necessary guardhouse. Mr. John McManus, of 237, Hammersmith Road, has secured the contract. Works of a similar magnitude are about to be contracted for to be erected at Aldershot.

A Liverpool Churchyard.

A matter which will very shortly have to be decided by the Corporation of Liverpool is that of improving St. John's Churchyard.

The city surveyor, Mr. T. Shelmerdine, has prepared a model of the ground. The centre is occupied by the proposed Rathbone statue, while William Brown Street is shown widened from the present 60ft. to 90ft., and St. John's Lane from its 50ft. to 70ft., the churchyard being reduced in area. Considerable changes are shown in the garden frontages to the public buildings in William Brown Street. A model dealing only (but elaborately) with the churchyard, has been prepared by Messrs. C. O. Ellison and Son. This model, which preserves direct paths in all directions across the churchyard, has as its centre a clock tower, while a band stand and a western entrance to St. George's Hall form other special features. Between six and a dozen statues are provided for in the central garden and at the proposed

virgin and foundress of the Abbey of Ely. Ely Palace, besides being a Liberty, was also a sanctuary where persons pursued by the law for certain offences could not be arrested by the civil authorities. The late Sir Gilbert Scott's opinion was that the chapel was erected between 1290 and 1299, and coeval with the monument to the bishop in Ely Cathedral, a work clearly by the same hand, John of Guant, Duke of Lancaster, and father of King Edward the Fourth, took refuge here after his palace had been burnt down, and remained there until his death. King Henry the Eighth is said to have first met Cranmer in the cloisters. During the time of the imprisonment of Matthew Wren, Bishop of Ely and Uncle of Sir Christopher, the greatest and best part of Ely Place was pulled down.

PART OF CHANCEL, CHAPEL OF ST. ETHELDREDA, ELY PLACE, HOLBORN, E.C.
DRAWN BY ALFRED J. RODDIS.

western entrance to the hall, the door shown being a counterpart of the eastern doors. Both models convey far more than words or drawings can do, and will command the close attention of the public.

St. Etheldreda's, Ely Place, Holborn.

NEARLY six hundred years have passed since the history of Ely Place began as the London palace and chapel of the Bishops of Ely, a time when most of the bishops had seats, or, as they were then commonly called, places in or near London in which to reside during their attendance on Parliament. Every vestige of the Episcopal Palace has long since disappeared, and the only relic of antiquity now remaining is the chapel of St. Etheldreda, queen and

It was converted into a prison by order of Parliament in 1642; it was used as a hospital in the times of trouble that followed. It was sold to the Crown in 1772, afterwards purchased by Charles Cole, an architect, who built the houses, but preserved the chapel. It was then purchased by the Fathers of Charity, who restored the church and crypt, which occupied nearly five years, and was reopened for Catholic worship on June 23rd, 1879, on which day the Feast of St. Etheldreda, its titular patroness, is annually kept in the Roman calendar. The night watchman remains and calls the hour from ten o'clock at night until six o'clock in the morning. The illustration of part of the chancel chapel shown on this page is from a drawing by Mr. Alfred J. Roddis.

New Patents.

These patents are open to opposition until July 9th.

1899.—Paint Removers.—9,337. R. H. MERCER, London, S.W. The composition consists of hydrate of calcium, 1 part; caustic soda (98 per cent.), 1 part; and water, 4 parts. This mixture is allowed to settle and cool, when to it is added: water, 4 parts, and dextrine or starch, 1 part.

Moulds for Brick-making.—11,142. H. ALEXANDER, Leeds, and J. HOLDING, Sheffield. The mould or liner is composed of wrought iron and hard steel, so arranged that a hard face is formed by the steel on that part of the sides of the mould where the wear is greatest.

Artificial Stone.—11,536. J. H. McLEAN, London, W. Burnt clay or burnt ballast is ground to the fineness of sea sand, and to it is added Portland cement well wetted, so as to produce a thick slurry. This mixture is placed in suitable moulds and is submitted to considerable pressure, which consolidates the mass into slabs or bricks for paving or other purposes.

Planing, Shaping and other Machines.—12,935. J. E. MATHEWSON, Broadheath, Chester. In order to provide these machines with reversing motion, the shipper rod is given an axial movement while moving endways, and the stops are so arranged that the contact between the stop and the lug or bracket is broken by the axial motion given to the rod, thus allowing the arm to over-run without danger of breaking the parts.

Drawing Pens.—13,634. F. GAUFROY, l'Isle-sur-le-Doubs, France. The handle of the pen consists of two metal strips fulcrumed near the nib end, and having at the other a regulating screw and a spring that tends to press the strips apart. If the pen is held lightly a thin line is drawn; if the back end is pressed upon the line becomes thicker. A different thickness of line is therefore obtainable without altering the regulating screw in the usual way.

1900.—Woodworking Machines.—4,554. T. BARNARD, Portslade, Sussex. This invention relates to a machine for the production of irregular, straight, circular or curvilinear mouldings, and for cutting out the pocket pieces of pulley stiles in sliding sash frames. There is a suspended horizontal rotary cutter spindle, movable towards or away from the work, and below is a table or bed which has a revolving motion and an independent parallel sliding motion. The pocket cutting is accomplished by mounting on the sliding frame a small circular saw, driven from a pulley on the horizontal spindle.

The following specifications were published on Saturday last, and are open to opposition until July 16th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—10,029, DOUGLAS, controlling of shop window illuminating electric lamps. 10,073, PATERSON AND DICKSON, method of decorating metal. 10,241, IMRAY (*Oesterreichische Gasglühlicht und elektricitäts-Gesellschaft*), electrical incandescent lamps with osmium filaments. 10,518, TANNETT-WALKER, travelling cranes. 10,710, ALLEN, method of securing an automatically-controlled supply of water to the carbide of calcium in acetylene gas generators. 11,448, RICHARDY, sanitary flushing apparatus. 11,825, DEAS, hydraulic hoisting or elevating apparatus. 12,949, ANDREWS AND GLASS, connection of house-service or branch conductors to electric mains. 12,966, WORMALD PATENT LOCKS CO., LTD., and TURNER, locks operated by keys. 13,239, DAVIES AND JONES, cranes. 13,323, UEHLING, casting moulds. 13,660, THOMPSON AND THOMPSON, grip for rope haulage. 14,010, SWINBURNE AND STEARN, means for use in the production of radiation and light by electricity. 14,038, SMETHEURST, material to be used as a

waterproof covering for roofs or as a substitute for glass. 14,067, DAY AND MURCH, moulds. 14,072, ELWORTHY (*Zuberbühler*), automatic generator and storage vessel for acetylene gas. 14,231, SHEPPARD, fireproof windows. 14,379, GOODWIN, composition for purifying acetylene gas. 14,433, DARNLEY, WALLIS AND CARTMEL, glazing bars and method of glazing roofs. 14,462, HADDAN (*Arnold*), separators for screening or separating the fine material from the coarser argillaceous earth, mineral-bearing earth, &c. 14,740, BUTTERFIELD, construction of sheet metal cisterns. 15,080, SALAMON, manufacture of refractory materials for building purposes. 15,140, BOURRY, drying ovens. 15,387, MCLAY, heat non-conducting coverings. 16,732, ABEL (*firm of Berliner Holzcomptoir*), process for the preservation of wood. 16,856, SAMPSON AND ATTWATER, casement stays. 17,220, MARSHALL, windows. 20,013, PALAZZI, PALLAZZI AND PIVETTA, soldering lamp or burner. 21,432, KOCH, appliance for decorating wood, leather or cardboard by burning.

1900.—1,219, IMRAY (*McDowell*), dies for punching sheet metal. 2,661, PARKS, acetylene lamps. 3,925, HELMECKE, manufacture of mantles for incandescent gas lighting. 4,422, SHORE AND WALKER, pumping engines. 4,539, SCHUSTER, devise for testing gas pipe systems. 4,992, ADAMS, slop sinks. 5,026, CLARE, radiators for heating buildings. 6,037, BECK (*McClure*), hot blast stoves. 6,062, POSNO, incandescent vapour lamps. 6,189, OTTESON, pipe wrenches. 6,308, FESSENDEN, electric incandescent lamps. 6,311, FULLER, value-indicating weighing apparatus. 6,524, JOHNSTON, wall ties. 6,737, RIDDLF, fence posts. 6,882, BRAY, gas burners.

Masters and Men.

The Macclesfield Building Trade wages dispute has been settled by the men accepting an increase of $\frac{1}{4}$ d. per hour.

The Peterhead Master Masons, owing to the depression in the building trade, have expressed their intention of lowering wages from 7 $\frac{1}{2}$ d. to 7d. per hour. The men threaten to strike if the intention is carried out.

The Potteries and Newcastle District Bricklayers' Strike has been settled by the men accepting the offer of the employers of an advance from 8 $\frac{1}{4}$ d. to 8 $\frac{3}{4}$ d. per hour in place of the $\frac{3}{4}$ d. demanded, the agreement to be binding for three years.

Edinburgh Masons' Dispute.—The Edinburgh and Leith Operative Masons decided at a meeting last week not to agree to the masters' proposals to revert to a three-months' agreement and a reduction of wages to 9d. per hour, to take effect to-day. The present conditions are 9 $\frac{1}{2}$ d. per hour and a twelve-months' agreement. Unless some arrangement is come to by the masters and men, it was agreed to strike work to-day.

East Riding Antiquarian Society.—The members of this society held their first summer meeting last week, when Selby and Brayton were visited. Mr. W. N. Cheesman, of Selby, remarked that part of the first church, as built by Abbot Hugh, was not altogether destroyed, but was to be found in the north transept, the nave, and triforium. As regards the resemblance of Selby Abbey to the Cathedral at Durham, he found that the same workmen who worked at Durham finished the work at Selby, or vice versa. Some of the men worked at both places. Subsequently, the party journeyed to Brayton, and inspected the church there with its many interesting features, the chief of which is a D'Arcy monument, rich in masonry, and bearing the recumbent figures of Lord D'Arcy and his wife. This dates back to 1558. The lantern tower and Norman arches were also features of interest. The vicar of Brayton explained that, on the restoration of the church, the sedilia were discovered in the south wall of the chancel perfectly intact.

Keystones.

St. George's Church, Botolph Lane, E.C., is to be demolished.

A new Organ at St. Faith's Church, Lincoln, has been erected at a cost of £550 by Messrs. Wordsworth and Co., of Leeds.

New Technical Schools at Barrow are being built by the Corporation at a cost of between £10,000 and £12,000. The schools are situated in Abbey Road.

At Carnalway Parish Church, Dublin, a new three-light window has been erected. Messrs. Comber and Bucknell, of London, furnished the designs, and Mr. Anderson, of Dublin, executed the contract.

New Leicester Church.—The foundation-stone was recently laid of the new church, dedicated to St. Augustine, which is being built at Newfoundpool at an estimated cost of £4,750. Accommodation will be provided for 740 worshippers.

British Institute of Certified Carpenters.—The members of this Institute visited Westminster Abbey on Saturday, May 26th, accompanied by the president, Prof. T. Roger Smith, F.R.I.B.A., and the vice-president, Prof. R. Elsey Smith, A.R.I.B.A.

St. Martin's Church, Norris Bank, Stockport, of which the foundation-stone was recently laid, is being erected from designs by Mr. R. B. Preston, architect, of Manchester. Accommodation will be provided for 650 persons in the completed building, the estimated cost of which is about £8,000.

New Roman Catholic Cathedral, Westminster.—The opening of this building has been postponed from the date originally decided upon, September 29th of this year, to June 29th of next year. The postponement has been made in the hope that two or more of the side chapels may, by then, be fully decorated with their mosaics.

Site for Dunfermline's New Baths.—The Dunfermline Town Council have agreed to purchase some old properties in Pilmuir Street at a cost of about £4,000 as a site for the new baths and gymnasium which Mr. Andrew Carnegie has offered to provide at a cost of £20,000. The old baths, which were given by Mr. Carnegie in 1877, are to be sold.

Art for Schools.—At the annual general meeting of the Art for Schools Association held at 29, Queen Square, Bloomsbury, on May 28th, the Bishop of London presiding, Mr. Lionel Cust said it had been hoped that Mr. G. F. Watts would have filled the vacant post of president created by the death of Mr. Ruskin, but owing to advancing years and weak health he was unable to do so. The Earl of Carlisle had, however, accepted their invitation.

Barston Church, near Knowle, has been reopened after having been closed for ten months for renovation. The church dates back to the thirteenth century, and, after being burnt down in 1721, the present brick structure was erected. The work includes a new organ chamber and vestry and a new porch, while the old plastered ceiling has been removed and the roof opened out, the old oak being retained and the ceiling made of pitch-pine. The cost has been £700, towards which £650 has been subscribed. The architect was Mr. Barker, of Hereford.

Lewisham Church Extension.—A new temporary church, dedicated to St. Hilda, has been opened in the Crofton Park district of Lewisham. This is the third additional church which the rapid increase of population in the old parish has rendered necessary. The other two are St. Andrew's, Catford, and St. Cyprian's, Brockley, the memorial stone of which was laid the other day by the Lord Mayor. St. Hilda's temporary building has cost about £2,200, but no doubt it will serve some suitable purpose after a permanent church has been built. A site has been acquired at a cost of £1,000. Mr. John E. Newbury will furnish designs for the new church.

St. Paul's Free Church, Perth.—The present building is to be taken down, and a new church erected on the same site.

A new Baptist Chapel at Killay, Swansea, has been built from designs by Mr. W. Williams. The contractors were Messrs. Walters and John, of Morriston.

Gray's Inn Road Workhouse.—The new casual wards to be erected on the site of this workhouse will be built from the designs of Mr. A. Saxon Snell, architect, of 22, Southampton Buildings, W.C.

At St. Andrew's Church, Fulham, S.W., a new altar and reredos have been erected by Messrs. Harry Hems and Sons, of Exeter. The altar is 9ft. long, 3ft. 4in. high, and 3ft. wide, and the reredos is of Caen stone, with lapis-lazuli mosaic as a background for the sculpture.

Stephs Established Church, Glasgow, which was recently opened, accommodates 400 persons, and consists of a nave, side aisle, transept and a chancel, with vestry attached. Mr. P. MacGregor Chalmers, of Glasgow, was the architect. The cost of the church has been £2,500.

Additions to Clayton Hospital, Wakefield.—Messrs. Simpson and Richardson, architects, of Wakefield, have just prepared plans for another addition to this hospital, and at the opposite, or Northgate, end of the extensive block. The proposed addition will be a Nurses' Home, and will be practically a detached building, with nineteen bedrooms, dining hall, pantry, &c. The operating theatre of the hospital is also to be altered and improved. The additions and alterations to be made shortly will cost nearly £3,000.

Cottage Hospital for Corbridge, Newcastle.—A new building at Corbridge designated "The District Nurses' Home and Harry S. Edwards's Wards," which will be opened this month, has been erected from designs by Messrs. Armstrong and Wright, of Newcastle. It comprises on the ground floor two wards for two patients each of both sexes, together with bathroom, offices, dispensary, matron's sitting room, kitchen, larder, and large store, with spacious entrance and passages; and on the first floor large storeroom and three bedrooms, one of which can be used as a private ward.

Sanitary Institute Congress.—With a view to advancing the consideration of the problem of the Housing of the Working Class population in London and other large towns, which presents so many difficulties in its solution, the Council of the Sanitary Institute have arranged to hold in the Parkes Museum, Margaret Street, W., a conference on the subject, in connection with which will be an exhibition of plans and models. Local authorities in London and the provinces have been invited to send delegates. The date of the conference (July 30th and 31st) is in the week preceding the visit of the Institute to Paris and the International Congress of Hygiene and Demography. The full arrangements have not yet been completed, but the following particulars may be given. On Monday, July 30th, from 10 a.m. to 1.30 p.m., the subject for discussion will be "Unhealthy Areas and Displacement of Town Populations," and from 3 p.m. on the same day visits will be made. On Tuesday, July 31st, the subjects for discussion will be "Improved Houses for Town Dwellers" and "Improved Means of Communications." Visits will also take place in the afternoon. Plans and models coming under any of the following heads will be accepted for exhibition:—Unhealthy areas and improved areas; urban dwellings on the systems of self-contained flats, associated flats, family houses, poor men's hotels, common lodging-houses, shelters; suburban dwellings; rural dwellings; hop and fruit pickers' temporary dwellings; model estates, villages, &c.; models and plans illustrating the application of building Acts and regulations. Drawings may be sent strained or in frames. If unmounted plans are sent the greatest care will be taken of them, but the Institute cannot be responsible for accidental damage.

New Co-operative Buildings at New Hirst, Newcastle, have been built by Messrs. Cocks Brothers, of Blyth, at a cost of £2,000.

New Railway Mission Hall at Bury.—The new mission hall at Northgate Street Station, Bury St. Edmund's, has been erected by Mr. W. Harbrow, of London, S.E.

The Ancient Church near Sockburn Hall, Darlington, which dates from the early part of the thirteenth century, is being restored by Sir Edward Blackett, who also intends to rebuild the Conyers Chapel, in which will be placed the whole of the Conyers relics.

North-Eastern Hospital for Children.—Considerable inconvenience is experienced by the inadequacy of the present premises, and it has been decided to erect extensions at an estimated cost of £40,000. The first part of the scheme, which will cost £25,000, is to be begun as soon as possible.

Orpington Priory, so well-known to antiquarians, is in the market. It is a fine gabled mansion with mullioned windows of the Tudor period. The oldest part of the building, which is well preserved, is a stone-buttressed annexe, erected in 1393. The hall and principal rooms date from 1471, and are panelled with oak.

G.W.R. Extensions at Cardiff.—The Great Western Railway Company have acquired a considerable portion of land in Newtown, Cardiff, for the purpose of extending their goods and storage yards and considerably adding to the siding accommodation just outside their Cardiff station. The area is now a thickly-populated residential quarter, and it lies between Adam Street and the present lines, being nearly opposite to the gaol.

Suggested New Station for Birkenhead, Bradford.—The Great Northern Railway Company have under consideration a scheme for the erection of a new station for Birkenhead. In view of the proposed tramway through the village, it is suggested that if the station were removed to near the railway bridge at the top of East Brierley, close to where the trams will pass, it would be much more convenient. The site suggested is also within easy reach of the population of Hunsworth and Westgate Hill.

Sewage Purification.—In the course of a lecture on "The Bacteriological Purification of Sewage," delivered before a recent meeting of the Yorkshire section of the Society of Chemical Industry, Mr. W. H. Harrison, B.Sc., chemist at the Leeds Sewage Works, described the treatment of sewage by septic tanks—sending the sewage slowly through a large cesspool—and showed that about 50 per cent. of purification was effected, and, as far as could be ascertained at present, about 50 per cent. of the total suspended solids in the sewage was destroyed. The process was essentially one of anaerobic fermentation. He next dealt with the filtration of screened sewage through contact beds—tanks filled with coke, clinker, or other material as the filtering body. The beds are filled with sewage, which is allowed to stand for a certain period, and then they are emptied. With screened sewage this process was repeated through two beds, one composed of rough material and the other of very fine material, and the effluent was fit to turn into a river. Accumulations occurred in the rough bed, and these gradually decreased the amount of sewage which could be treated by a particular bed in twenty-four hours. From this double filtration process a good effluent could be obtained, but the sludging-up of the rough bed was the chief difficulty, great expense in cleaning the filtering material being involved. He next referred to continuous filters made of very rough material, such as coke or clinker. These, he said, gave a good effluent, though it was very turbid on account of the great amount, comparatively speaking, of solid matter which they contained. This solid matter was easily removed by sedimentation, producing an effluent which was quite satisfactory. The sludge produced was non-putrescent.

Engineering Notes.

Change of Address.—Mr. David Home Morton, M.Inst.C.E., has removed to 130, Bath Street, Glasgow.

Institution of Electrical Engineers.—At the recent annual meeting of this institution it was announced that Professor John Perry, D.Sc., F.R.S., had been elected president, and that M. E. Mascart, president of the International Electrical Congress in Paris, had been elected a vice-president.

Todmorden Water Supply.—The first sod of the borough new waterworks at Todmorden was cut on Thursday last. The borough works are estimated to cost £50,000. The reservoir covers 700 acres, its holding capacity being 130,000,000 gallons, with a yield of 700,000 gallons daily. The work is to be completed in four and a half years.

The Water-supply of Newcastle.—The City Engineer (Mr. Laws), who keeps an eye on the water-supply of Newcastle on behalf of the Corporation, reports that the past year has been a good one. The reservoirs were filled in May, 1899, and the water in them never fell during the remainder of the year below 933,000,000 gallons. The reservoirs are full now, and there does not seem to be any reason to be anxious for the coming summer. The new works of the water company in Redewater are making good progress. Four years more should see them practically completed, and 2,000,000,000 gallons added to the storage. The daily consumption for all purposes is about 22,000,000 gallons.

Electric Light at Buxton.—The Buxton Electricity Works, for which the Local Government Board sanctioned the borrowing of £24,769, have been opened. The principal streets are now lighted by arc lamps, and a large number of private consumers have had the current laid on. The matter was placed in the hands of Professor Kennedy, who has advised the District Council. A continuous-current, three-wire system, with lamps running at 230 volts, has been adopted. The station is situated adjoining the gas works in Ashwood Dale, and has cost £5,000. Mr. Edward Calvert is the chief engineer appointed by the District Council, and Mr. Kenneth Watson represents Professor Kennedy. About £22,000 has been expended up to the present.

Mr. William Lindley, a well-known engineer, died at his residence in Blackheath on May 22nd, at the age of ninety-two. A great fire broke out in Hamburg in May, 1842. It lasted three days and nights and destroyed a considerable portion of the town. Mr. Lindley was asked by the city authorities to help in checking the outbreak. He suggested the blowing up of a number of buildings with gunpowder in order to stop the further progress of the flames. The work was carried out under his personal direction, but owing to rumours spreading among the populace that Mr. Lindley was the chief agent of a plot among the English to blow up and destroy the port of Hamburg his life was endangered. The Senate entrusted him with the work of preparing the designs for the rebuilding of the city. He carried out the drainage of the Hammerbrook, a low marshy district lying below the flood level of the Elbe, and was responsible for the extension of the Hamburg-Berlin railway terminus and the harbour, with its good-sheds. From 1844 to 1849 he was occupied building the new Hamburg waterworks, one of the first undertakings in which the system of constant supply was adopted. The Hamburg gas works was also a work which was committed to Mr. Lindley, as well as the large public baths and wash-houses for the poor. The British Government entrusted him with various works on Heligoland, especially with the construction of the great retaining wall, and the city of Frankfurt invited him, with other experts, to report on the drainage of the city. He retired from the active duties of his profession in 1879.

Professional Practice.

Bath.—The new Victoria Art Gallery, which constitutes Bath's permanent memorial of the Queen's Diamond Jubilee, was opened last week. The new Gallery forms a portion of an imposing pile of buildings having for its centre the old Guildhall, with two fine wings, the one comprising the new municipal buildings and the other the new Gallery and technical schools. The Art Gallery, which completes the northern wing, extends down Bridge Street to the corner of Newmarket Row, and the general lines of the elevation of the technical schools are continued. The design is in complete harmony with the remainder of the buildings which form this block, both wings having been erected from the plans of the same architect, Mr. J. M. Brydon, of London. The Gallery proper, with the reference library, &c., on the ground floor, forms the main elevation towards Bridge Street. At the corner of Newmarket Row is the principal doorway, leading to the entrance hall on the ground floor and the vestibule on the first floor, with the staircase on the left and the entrance to the Gallery and library on the right. The angle formed by the two streets is rounded off, so that the entrance hall becomes hexagonal on plan, the corresponding vestibule above being somewhat similar, but adorned externally with Ionic columns and covered by a dome, thus investing the angle with much importance architecturally. A separate entrance to the reference library is provided in the centre of the Bridge Street front; above this is provided a niche for a statue of her Majesty the Queen, with the Royal arms above, and on each side are four other niches in the wall of the Gallery for the reception of statues. The front is surmounted by a balustrade corresponding to that of the technical schools. Internally, the entrance hall and vestibule on the first floor are decorated with columns round the walls, and are paved with black and white marble. The vestibule is ceiled with a dome in enriched plasterwork. From the entrance hall on the right is the print room, 38ft. by 32ft., and from that again opens the reference library, 50ft. by 32ft., the remainder of the ground floor being occupied by a new Board room and a master's room for the technical schools. The vestibule on the first floor is reached by the staircase to the left of the entrance hall; and immediately facing the archway, by which it is entered from the stair, is the door to the Art Gallery, a fine apartment, 89ft. long by 32ft. wide and 25ft. high, lighted entirely from the roof. It occupies nearly the whole of the first floor, the remaining portion being given up to two additional rooms for the schools. There are also a porter's room on the ground floor and a curator's room on the first floor, and through communication is provided between the Art Gallery, the library and the technical schools for the use of students and others. In the basement, with a separate entrance from Newmarket Row, is the receiving and unpacking room, with a lift for hoisting pictures to the Gallery above. The builders were Messrs. Jacob Long and Sons, of Bath.

Bristol.—Two schools, which will afford accommodation for 900 children, are now being built at Dean Lane, Lawrence Hill, by the Bristol School Board. The architect is Mr. John Mackay, of Kingswood. The site, which is near the Great Western Station at Lawrence Hill, measures 400ft. by 116ft., and in addition to the main entrance from Dean Lane an additional entrance will be made from Beacon Street, and a caretaker's house erected on the present site of two cottages. In extent the large school is 170ft., and there is a depth of 60ft. This building has a southern aspect, and is entered from a well-lighted hall, whence a corridor leads into the central hall, which measures 66ft. by 29ft. Around this hall are grouped six classrooms, so arranged that the head-master or mistress obtains an uninterrupted view of all the scholars when at their various class duties. At each end of the central hall are the teachers' rooms, cloak-

rooms, and lavatories. Such is the arrangement of the ground floor, and the first floor is identical, the only variation being that the main hall is more lofty than the one below. Both floors are fireproof. The schools are built of pennant stone, with Bath stone dressings, and Mr. A. J. Beavan, of Westminster, is the builder.

Eccleston.—The new church of St. Mary the Virgin at Eccleston, which was briefly referred to on page 315 of last week's issue, has cost between £30,000 and £40,000, and has been erected from the designs of Mr. G. F. Bodley, A.R.E.A. It was the gift of the late Duke of Westminster. The new church is designed in the style of the fourteenth century, and is strictly English in character. It has naves and aisles, and a chancel formed by open screens of carved oak; it is lofty in proportions, and entirely vaulted with stone; and it is lighted with many traceried windows, of which those of the clerestory are perhaps the most beautiful. Treated with much breadth of effect the fabric is of one continuous width, including the tower, broken only by rich screen work across the entire width of the interior. The tower at the west end is a massive composition, with deeply set double belfry windows and gabled buttresses. The church is groined throughout with red stone vaulting having

and the legal church ornaments of cross and candlesticks were all designed by the architect and approved by the late Duke, who took great interest in all the work connected with the church. The contractor was Mr. Franklin, of Deddington, Oxon; the stained glass was carried out by Messrs. Burlison and Grylls; and the chancel reredos and figures on porch and side chapel reredos were executed by Messrs. Farmer and Brindley; the oak figures on the font cover and screen are by Mr. Bridgeman; Messrs. Elsley and Co. executed the lectern, ironwork, and gas fittings; Messrs. Starkie Gardner the pulpit rail; and Messrs. Barkentin and Krall the memorial brasses.

Hull.—The architect of the new Sunday schools in connection with St. Augustine's Church, illustrated on this page, is Mr. John M. Dossor, A.R.I.B.A., of Hull. Arrangements are being made to proceed with the work at once. The building is of two storeys. On the ground floor is placed the boys' school, consisting of a large central hall and two classrooms, with necessary sanitary arrangements, and at the end of the central hall is placed the infants' schoolroom. The upper floor is occupied by the girls' school, which consists of a hall 65ft. long, and having a platform which is separated from the hall by folding shutters, and when not in use for

NEW SUNDAY SCHOOLS AND RECREATION HALL TO THE CHURCH OF ST. AUGUSTINE, HULL.
JOHN M. DOSSOR, A.R.I.B.A., ARCHITECT.

carved bosses and well-moulded ribs, and the whole of the interior is of wrought stone ashlar. All the windows, which are of varied and elegant traceries, are filled with stained glass. The reredos in the chancel is of red stone, richly carved and elaborated with gilding; the reredos in the side chapel is of subordinate character. Screens surround the chancel, beautifully wrought with tracery and carving. There is a "hang-over" towards the nave, which gives shadow and dignity. The oak work is as yet left in its natural crude yellow colour, but it is the wish of the architect to bring it into harmony with the red stone by staining. The church is fully furnished. The font is of marble, with rosso antipuo columns, and is surmounted by an oak cover, enriched with figures of the Evangelists and other saints. There are open oak seats in the nave and aisles, while space is left for some chairs. A sedilia of carved oak is provided for the chancel, and credence tables for the chancel and chapel. The belfry contains eight bells by Messrs. Taylor, of Loughborough. The organ is placed over the tower arch, as high up as possible. This arrangement prevents the floor space being encumbered. Altar frontals are provided for the different Church seasons,

entertainments can be used as a classroom. The usual sanitary arrangements are also provided on this floor. Access to the large hall is obtained by two wide stone staircases, one at each end of the building. The roof is of hammer-beam construction, ceiled at the collar. Underneath the platform, on a mezzanine floor, two small dressing-rooms are provided for use when the hall is used for the purposes of entertainments. These dressing-rooms can both be entered from the staircase, or from the platform itself. At the opposite end of the hall, on a mezzanine floor, over one of the ground floor classrooms, a cloakroom is provided, with access from the other staircase. Separate entrances are arranged for the girls', boys' and infants' schools, and all classrooms are so arranged that they can be entered or emptied without passing through either of the central halls or through any other classroom. It is intended to erect the building with red Lincolnshire bricks and Ancaster stone, with tiled roof.

Liverpool.—A new Roman Catholic church, dedicated to St. Charles, has been erected in Aigburth Road, Liverpool, from the designs of Messrs. Pugin and Pugin, of London and Liverpool. The structure consists of a nave,

with a tower at the west end facing the road, and a chancel flanked by two chapels; the sacristies and confessionals being on the Gospel side. The tower, 95ft. high, is in three storeys, the storey over the porch being utilised for the organ, on a level with the choir gallery; above this is the belfry, with double windows on each side, and accommodation for a peal of bells. There are three niches in the lower portion of the tower, placed in this position so that the figures which will be put in them may be more easily seen. The tower is crowned with a corbelled and embattled parapet, with the angles emphasised by means of crocketed octagonal pinnacles. The outer material of the church is Yorkshire pierpoints, with red Runcorn stone dressings. Inside, however, white Stourton stone has been used instead of red stone, so as to harmonise better with the furniture of the church. The builder was Mr. Kirkbride, of Fleetwood.

London.—The new premises for the postal authorities at Mount Pleasant, which have cost about £113,000, are virtually an extension of the parcel post premises, the main floors of the two departments being separated internally by a glass partition. The main floor has an undivided area of 57,600ft., being 360ft. long and 160ft. wide. It is laid with blocks of maple, the walls are of white glazed brick, and the room is well lighted with arc lamps. There is a basement floor of a similar extent, and above is a floor of half the extent. One practical advantage to the public afforded by the new premises will be that newspapers and letters will be all treated together, instead of being taken to different parts of the building, and treated separately as heretofore. A letter and a newspaper simultaneously posted will therefore travel together, and should be delivered together, instead of the newspaper lagging behind as often happens. On the floors above there are all sorts of accommodation for the 1500 hands of one kind and another, constituting the provincial staff at headquarters. There are dining rooms and tea rooms, kitchens and sculleries, and pantries and reading rooms for those who are temporarily off duty. In these upper regions there are also several comfortable little bedrooms for superintending officers whose hours of duty render it convenient to sleep on the premises. There is an excellent bathroom for their convenience, and on all the floors there is the amplest provision of lavatory accommodation. Electric lifts at different points about the building run from top to bottom, and every floor has its great clock, all of them—with one exception—being electrically driven and regulated. In every respect this probably is by far the finest post office establishment in the world. The premises have been erected by Messrs. Lorden, of Upper Tooting, the clerk of the works being Mr. T. Leake.

Wellington (Salop).—A new Congregational church has been erected at Wellington. The design is wholly Gothic, and has been carried out in red brick, with Bath stone dressings to doors, windows, buttresses, &c. The entrance doorway is central to the main front gable, and over it is a large tracery window. To the right of the entrance, leading out of the central lobby, is a tower connecting the steps to the gallery, which it is hoped some time to complete by the addition of a spire. Spacious lobbies are provided on each side of the entrance porch, with double spring-doors to check the draught. The seats are of pitch-pine, stained and varnished, and provide sitting accommodation for about 300 worshippers, while another eighty or ninety can be accommodated in the gallery, which is situated over the entrance lobby. There is an open-timbered roof, carried on pitch-pine principals, and the ceiling is boarded. The chapel is well lighted. The whole of the work has been carried out by Mr. E. H. Nicholas, of Shrewsbury, at a cost of £23,000. The handsome pulpit has been erected by Messrs. Addison and Co., Waterloo Works, Wellington. The heating apparatus, which is on the low-pressure system, has been put in by Messrs. G. H.

York and Co., and the gas pipes and fittings by Messrs. Kynaston and Jarvis, of Wellington. The whole work has been carried out from designs and under the superintendence of Messrs. Ingall and Sons, architects, of Temple Row West, Birmingham. The completed scheme will provide for a schoolroom at the rear of the church, the present building having been designed with this object in view.

Trade and Craft.

Luminous Electric Radiators.

The problem of heating is one that has been tackled with varying success from all quarters, but the radiators which we now wish to refer to have a merit which most appliances of this kind do not possess, namely, that they supply light as well as heat and so make a room look cheerful and bright while at the same time warming it. This two-fold accomplishment is, of course, most meritorious, approaching more nearly to natural conditions, which are in all cases the best to accept as a standard of attainment. The Dowsing radiator consists of a certain number of long electric lamps, mounted within an enamelled frame and backed by copper reflectors. The heaters produce a considerable current of heated air besides radiating heat into the room, and they usually last much longer than ordinary incandescent electric lamps. The current can, of course, be turned on or off as desired, and there is practically no heat lost in warming up or cooling down, which means economy. In addition to being used as heat diffusers, the radiators may be used for such domestic purposes as toasting, roasting, airing, heating irons or warming food, a feature which makes them specially attractive. The proprietors claim for these radiators that in all applications where radiant heat is required they attain a far higher efficiency than is attained by any other forms. Ordinary electric radiators are air warmers, with little radiation; the Dowsing radiators both warm and radiate, and as they are instantaneously heated they can be used efficiently for a few minutes at a time. The current consumption is one-quarter unit for each heater per hour, so that a radiator with four heaters will consume one unit of electricity in the hour. The cost for one of these radiators with four heaters is about five guineas, but full particulars can be obtained by applying to the Dowsing Radiant Heat Co., Ltd., of 24, Budge Row, Cannon Street, E.C.

"Brickwood."

Most persons know what "iron-stone" and "iron-wood" mean, but they are only beginning to know and to appreciate "Brickwood." For a full, perhaps an etymological, explanation of this word we would refer our readers to Mr. Jabez Thompson, who has a terra-cotta works at Northwich, Cheshire, for it is he who is the patentee of this new building material. In appearance it is like a very porous firebrick, of a light red-brown colour. It is light (only half the weight of brick), fireproof and soundproof, durable (as permanent as a well-made brick), easy to fix (it can be either set in mortar like brickwork or nailed like wood), and easy to fit. It has no grain like wood, and is readily sawn or cut. A slab of it 1½in. thick may be heated to a full red heat on one side without scorching wood or setting fire to paper touching the other side, which is a good recommendation for its use in fireproof partitions, as a piece of brick of the same thickness will crack before it reaches the same heat. If "Brickwood" is impregnated with asphaltum it becomes waterproof, and can then be employed for underground building work, while, on account of its porous nature, mortar and plaster adhere to it most firmly. A partition wall 4½in. thick built with this material is as soundproof as a 9in. common brick wall, so that only half the quantity of bricks are needed, there is a saving of three-quarters in weight, and the labour of setting is lessened by one half. The patentee says:—"It is the only known fireproofing that will

stand the joint assault of fire and water. A block red hot may be plunged into water without injury." Its average weight per cubic foot is about 50lbs. (or 1,000 bricks 9in. by 4½in. by 3in. weigh about 1 ton 14cwt.). From tests made by Messrs. Kirkaldy and Son, of London, it has been ascertained that the crushing strain on six ordinary "Brickwood" blocks 9in. by 4½in. by 3in. is 1,526lbs. per sq. in., or 100 tons per sq. ft. A nail can be driven into the wall anywhere, the work dries quickly, and is vermin-proof, freezing or thawing do not disintegrate or affect the material, and it can be easily worked with edged tools. "Brickwood" is also very useful for filling in between the timbers of half-timbered work, because it is light, easily cut, and affords an excellent key for cement or stucco. The price of these bricks, 9in. by 4½in. by 3in., is now 65s. per 1,000 net on rails at Northwich. Samples can be had on application to Mr. W. H. Harvey, of 17, Old Queen Street, Westminster, S.W., who has recently been appointed sole agent in the London district for this material.

Preserving Wood.

Xylosote, or Hasselmann's Patent Wood Preserving Process, has been in full use for the last three years by the Imperial and Royal Government railways of Germany, who have erected imposing and extensive works at Kirscheen and Haar, Bavaria. The process is not a mechanical one, and, in the words of all the great experts and scientists of Germany who have examined and expressed themselves on the subject, is "the only one based on well-known scientific laws and principles." It has always been a great difficulty to thoroughly and evenly penetrate every part—the very heart of the wood—with the preserving agents, to keep them there, and then to render them indissoluble by atmospheric or other causes. Hasselmann's process claims to have overcome all these difficulties. The chemical substances not only penetrate the cellular tissue, but also chemically combine with the fibres or membranes of the wood. The chemical combination, being indissoluble, protects the woody fibres, and from the fact that these chemical matters are antiseptic and poisonous to all micro-organisms, prevents the decay and putrefaction of the fibres themselves. It not only acts by endowing the fibres of the wood with a lasting external protection in the inter-cellular channels, but much more, for by the internal process just explained it leaves these inter-cellular channels perfectly empty, preserving therefore that important desideratum, the elasticity of the wood. It is a well-known chemical fact that oils, gums, &c., cannot penetrate the fibres of wood, while solutions of the salts of heavy metals, such as sulphate of iron or copper, penetrate not only through the parenchyma, but also under certain influence will combine with the fibres in an insoluble manner. The differences between Hasselmann's system and all others can easily be proved by the simple process of boiling. With a piece of wood treated by any of the other processes, in a few minutes the impregnating fluid will be seen leaving the wood and floating on the water in the shape of oil or crystals; but hours of steady boiling will leave the wood treated by this new process perfectly intact, thus proving its power of resistance to all damp fungi and atmospheric influences. The sap having been previously entirely extracted from the wood, and before the impregnating liquid is forced into it, all future shrinkage, warping and "dry rot" are no longer possible. The capital sunk in the necessary seasoning of timber is therefore entirely saved; in fact, it appears that the greener the timber the more complete the impregnation. Secondly, it completely reduces or destroys the inflammability of the wood. Thirdly, the wood in no way loses its colour or appearance, but being perfectly dry, and in consequence of the chemical combination with the metallic molecules closely grained, takes an unusually brilliant polish. The wood can also be given any desired tint to penetrate and

go through the very heart of the wood. But perhaps the most important result claimed for the process is that it renders lasting and valuable, for all ordinary purposes, the commonest kinds of woods, making pine, poplar, &c., as hard and lasting as oak or ash. Another important item is that it is believed railway sleepers impregnated by this process will be proof against the attacks of the white ant. The cost of impregnating by this process is stated to be less than any other. We learn that the patent rights for Germany, Austria, Russia, and the United States have already been disposed of, while negotiations are pending for other countries. The patent has been acquired by Mr. Anthony Mähler and Mr. Robert H. Measures, the managing director of Measures Bros., Ltd., of London, S.E.

New Companies.

Gildenburgh Brick Company, Limited.

This company was registered on May 21st with a capital of £30,000 in 15,000 "A" shares of £1 each and 300,000 "B" shares of 1s. each to carry on the business of brick, tile and artificial stone manufacturers, builders' merchants, &c. The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers.

Home Counties Potteries and Brickworks, Limited.

This company was registered on May 21st with a capital of £15,000 in £1 shares to carry on the business of manufacturers of and dealers in bricks, tiles, pipes, terra-cotta, pottery, earthenware, glazed goods, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers. Registered office: 6, Great Winchester Street, E.C.

British and General Public Works Construction Company, Limited.

This company was registered on May 21st with a capital of £1,000 in £1 shares to construct, equip, maintain and work railways, roads, docks, piers, bridges, electrical and other works, &c. The first directors (to number not less than three nor more than five) are to be appointed by the subscribers.

Wilkinson and Leng, Limited.

This company was registered on May 22nd with a capital of £10,000 in £5 shares (500 5½ per cent. cumulative preference) to carry on the business of slate and marble merchants, brick, tile and pottery manufacturers, cement merchants, and dealers in building materials. The first directors (to number not less than two nor more than five) are T. Wilkinson and W. L. Leng (managing directors).

Highley Land and Building Company, Limited.

This company was registered on May 25th with a capital of £3,500 in £5 shares to carry on at Highley and Kinlet, Salop, the business of house and property owners and managers, and in particular to build certain dwelling houses, and lease the same to the Highley Mining Company, Limited. The first directors (to number not less than four nor more than five) are R. Brinton, H. Stonehouse and J. Williamson. H. Stonehouse is nominated by the Highley Mining Company, Limited, who may appoint one director while holding £1,000 shares. Registered office: Bank Buildings, Kidderminster.

James Woodward, Limited.

This company was registered on May 19th with a capital of £100,000 in £100 shares to acquire the business of brick and tile manufacturers now carried on by James Woodward at Swadlincote, Derby, and, generally, to carry on in all or any of their respective branches the businesses of brick, pottery, and tile manufacturers, makers of and dealers in every descrip-

tion of earthenware, china, terra-cotta, and ceramic ware; as manufacturing chemists, &c. The first directors (of whom there shall be not less than three nor more than seven) are J. R. W. Woodward (governor director), W. P. W. Woodward, H. W. Woodward, H. W. Woodward, H. W. Woodward and R. Ewing (all permanent). Registered office: Coppice Side, Swadlincote, Derby.

Friday, June 15.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Lewis F. Day on "Ornamental Design."—XX 11.30 a.m.

Saturday, June 16.

ARCHITECTURAL ASSOCIATION.—First Summer Visit to Deepdene, Dorking.

A Picture Exhibition in Bermondsey has been opened at the Bermondsey Settlement, Farncombe Street. It comprises pictures by many leading artists.

Boy's School, Morgan Street, Tredegar Square, E.—Alterations and renovations are being carried out at this building under the direction of Mr. G. Elkington, architect, 95, Cannon Street, E.C.

Acetylene for Benares.—The railway station of the ancient and holy Indian city of Benares is to be lighted by the newest form of illumination—acetylene gas. The contract has been given to Messrs. Lockerbie, of Birmingham.

Board School Extension at Bradford.—At a meeting of the Bradford School Board held on Wednesday last it was decided to spend £1,175 on the purchase of the additional site for the proposed Grange Higher Grade Board School. It was also decided, subject to the consent of the Board of Education, to purchase 11,281 sq. yds. of land at 3s. 3d. per yard in Lapage Street, as a site for a new school for the Bradford Moor district. A proposal to accept tenders for the erection of the Green Lane School, amounting to £28,647, was referred back.

Bristol Society of Architects: Presentation.—At a meeting of this society held on Monday in last week Mr. Frank Wills, the president, in the chair, a presentation of a very handsome silver salver was made to the hon. secretary (Mr. H. Dare Bryan), who is shortly to be married. Mr. Mowbray Green A.R.I.B.A., of Bath, then read a paper on "The Renaissance Architecture of Bath and Neighbourhood." The work of the middle of the last century done by the Woods, father and son, Baldwin, and others was described and the great improvement in the laying-out and enlargement of the city, due almost entirely to the artistic and business ability of the elder Wood, was clearly shown by means of maps and drawings.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.

TO BUILDERS and CONTRACTORS.

The Asylums Committee are prepared to receive TENDERS for the ERECTION of FARM BUILDINGS at the Heath Asylum, Bexley, Kent.

Instructions for Tender, form of Tender, and contract, with specification and bills of quantities, can be obtained from the Clerk to the Committee, 6, Waterloo-place, S.W., on payment of £5 for each copy, for which payment a receipt will be given, and the drawings can then be inspected at the Office of the Architect, Mr. G. T. HINE, 35, Parliament-street, S.W., between the hours of TEN and FIVE.

The amount deposited will, after the Committee have come to a decision upon the Tenders received, but not before, be returned to the Tenderer, providing he shall have sent in a bona-fide Tender, and shall not have withdrawn the same.

Tenders must be on the printed form, and be accompanied by the form of contract and schedules thereto and form of bond.

The Tenderer must also deliver with his Tender, but in a separate sealed envelope, a set of the bills fully priced out and moneyed in detail and signed. The bills so delivered will be returned unopened to unsuccessful Tenderers. Those delivered by the Tenderer whose Tender may be accepted will have to be approved by the Architect.

The Tender and accompanying documents, completed in accordance with the instructions attached to the form of Tender, must be enclosed in the authorised sealed cover, endorsed "Tender for Erection of Farm Buildings at the Heath Asylum, Bexley," and be delivered at the Office of the Committee, 6, Waterloo-place, S.W., not later than TWELVE o'clock noon on MONDAY, JULY 9th, 1900, after which time no Tender will be received.

Any Tender not made on the printed form, or not filed up and complete in every particular, in accordance with the instructions, will be rejected.

The Committee do not bind themselves to accept the lowest or any Tender.

The contractor will have to enter into a bond in the penal sum of £250 with two approved sureties, each in the sum of £125 as security, for the performance of the contract.

R. W. PARTRIDGE,
Clerk of the Committee.

No. 6, Waterloo-place, S.W.,
May, 1900.

COMPETITION.**COUNTY BOROUGH of CARDIFF.**
TO ARCHITECTS.

The Corporation of Cardiff invite COMPETITIVE DESIGNS for their proposed NEW ASYLUM for 1,250 patients at Whitechurch, near Cardiff.

The Competition will be in two stages.

The first stage will be open to all architects, and the drawings therefore must be to a small scale in pencil. From the designs submitted in that stage the authors of six will be selected to enter the second stage of the Competition, the drawings to be in ink according to the requirements of the Lunacy Commissioners. A premium of One Hundred Guineas will be paid to each competitor in the second stage who complies with the conditions, and the successful competitor placed first will be employed to carry out the buildings on the terms stated in the conditions.

Printed conditions and instructions can be obtained on application to the Borough Engineer, Town Hall, Cardiff, on payment of One Guinea, which will be returned on receipt of a bona-fide design, or if the conditions are returned by JUNE 30th. In the selection of the designs the Corporation will be advised by Mr. G. T. HINE, Architect to the Commissioners in Lunacy, as Professional Assessor, whose decision shall govern the selection of the designs and be final and binding in all stages of the Competition.

Designs in the preliminary stage of the Competition, sealed and endorsed "Design for New Asylum," must be delivered to the Borough Engineer not later than TWELVE o'clock noon, on SATURDAY, AUGUST 25th, 1900.

By order,
J. L. WHEATLEY,
Town Clerk.

Town Hall, Cardiff,
May 30th, 1900.

An Architectural Causerie.

Utilitarian Art.

It has been pointed out with considerable reiteration in the pages of the art reviews,

that the activity of the allied or subsidiary arts is on the increase, as well as in the full lusty vigour of creative youth. Few who follow in a more or less sedulous degree the artistic progress of to-day will care to dispute the first part of this statement, but the second will at least repay a little enquiry into its reality and truth before its final acceptance. The allied, the subsidiary, or the secondary arts, as they are designated in turn, are all bad titles—obviously bad, and, to start with, it would be a real service if someone would invent a more fitting and expressive title with which to name the numerous Art streams, all more or less tributary to the great river of Architecture.

The exhibitions conducted by the committee of the Arts and Crafts Society will be taken by all, I should think, as the material expression of the arts whose character is in question, and anyone familiar with these recurring exhibitions will be able, I hope, to follow the line of my argument. Let me quote the views as to the aims and work of the Society as expressed by one of its members—a man of real live enthusiasms, and of considerable ability in the artistic world. Their mission, he has told me, was to cement the growing union between the craftsman and the designer, to unite them if possible, and make them one; a good aim it will be said, worthy of all praise and success. The Arts and the Crafts, he continued, have the same ideal at heart as was the reality with the mediæval Italian workmen of the early Renaissance, the same as was the germ idea of the northern Gothic builder of the thirteenth and fourteenth centuries. "Art for Art's sake" is a cry which has brought down Nemesis—a rather just Nemesis—upon those who used it ill-advisedly; but I gathered that this also is part of the art creed of the committee. Their creed is really very embracing if somewhat paradoxical, and among other extremely high idealistic hopes were the social regeneration of the worker through his art, the formation of art guilds on the model of the workers' guild of mediæval Nuremberg, and the advancement of utilitarian Art, of Art for the people, an Art practicable and applicable to the common everyday middle-class life, an Art even which should touch the "masses," to use an odious term.

Now this last idea really did strike home in me, rousing a strong desire to refute such faulty reasoning, and in my attack on it chance favoured me with good fortune. It so happened that this very man who was so quick as we have seen with eloquent definitions of his ideals as a member of the Arts and Crafts Committee, was himself an exhibitor—an exhibitor of most choice jewellery

and silver work exquisite in design, and equal in all respects in workmanship. It is needless to mention the prices that were asked: they were beyond the dreams of avarice of even the most imaginative member of the middle-class. Where, I asked, was the vaunted practicability, the Art for the Million cry now? "You would not debar me," he returned, "from seeking a more wealthy and remunerative public," and my answer was, "No; but do not speak too much of the practicability and the utilitarian side of

onlooker at his meal, like the brooding spirit of indigestion hanging over him in primary colours. In the exhibition of last year there were cabinets of most original design, but of really doubtful utility; in one case the doubtful part showed its weakness in the exhibition itself. There were door-knockers, handles, bell pushes, showing a charming faculty of originality and execution, yet who but a connoisseur with a golden pocket could procure them for the adornment of his panels? No! the fault is almost unquestion-

TOWER OF S. JEAN, CAEN. DRAWN BY ARNOLD MITCHELL.

your Art." I have seen work by this man, jewelled silver salt-collars of enchanting shape and execution, but who but a Croesus would care to spend twenty guineas on such an addition to his dining-table equipment? I have seen chairs, high-backed and angular, with dainty Tudor roses carved in the seats, but what most enthusiastic artist would care to take his dinner seated upon a dainty Tudor rose carved in relief upon his chair seat? I know of dinner knives, green-handled, enchanting to the vision, with a shape like a miniature Moorish scimitar with its edge on the wrong side, but alas for their practicability. Conventional frieze decoration I have seen that painfully warns the startled

able; the tendency of the allied Arts undoubtedly is to lose its way among the back waters of aestheticism and diseased imagination. They are unattainable and unreal to the multitude, and above all they are not utilitarian. Neither are they flourishing in their creative youth, for if it were so they would not tread the path of crude conventionalism to such an extent, or cater so largely for the wealthy class, whose artistic partialities and sympathies have something of the nature of a fashion or hobby rather than that real appreciation given by the working middle-class.

The impossible logic contained in the first "ideal" given me will follow on naturally from the above. It was said that the mission

of the Arts and Crafts was to cement the growing union between craftsman and designer—to make them one. If this tendency, however, had any appreciable result, it would show itself by the work of the craftsman-designer himself, who would naturally work for his own class to a large extent—his own class, which is entirely alien to the wealthy nondescript collection of artistic buyers which is now being most catered for. The craftsman-designer will never come to stay until the National Art Education is more practical in its scope, and until it allows the practice of craft-work in its schools, which it practically does not at present. I, myself, know of cases of the craftsman-designer when he was a real accomplished fact, no thanks, however, to the system under which he worked, but his rare individuality was swallowed up and hidden beneath the iron system of commercial guilds. It is painfully apparent that the time is not yet for the omnipotence of the handicraftsman, but so surely as we wish for supremacy in our Art, so surely must it come, and he must take his rightful position above the artist who is designer alone. The art designer will never give us utilitarian art which every English home is crying out for, but in the artist-craftsman, the workman and designer and artist in one, we shall, it is hoped, finally reach perfection. F. B.

Journalistic Architecture.

JOURNALISM, nourished on the railroad and telegraph, has imbibed somewhat of their mechanism. It might be called the poor relation of the Arts, since it claims a kinship with them which is rarely acknowledged. The term journalism carries one's thoughts to the daily paper, but though the Press claims the title for her own, the other Arts—music, painting, and architecture—have each a special form of journalism adapted to their separate use. The popular and passing song is heard daily in our streets, though efforts have been made to suppress its principal organ. The painter and draughtsmen swell our papers and magazines with sketches whose term of life is generally on a par with their period of gestation. But with the architect it is different. He, carried away with a necessity for popularity, and a need for the easy methods of attaining it, fills our streets with buildings we may not fire, erections that on the morrow he, no less than we, would willingly be without; more unsatisfactory are they than a yearly edition of a daily paper. William Morris, it is said, was troubled with the thought as to what should be done with the bricks, when the time came for acknowledging the folly of attempting journalism in architecture. Every year adds to the perplexity of that problem. The populace still goes into bathetic rapture over each new patchwork edifice, suitable, perhaps, in design for cardboard, absurd in brick or stone, and is as equally ready to condemn the same after a few years' standing. But whereas loud praise bears much fruit, condemnation is generally silent, and sows but little seed. Not only do we erect shallow and flashy new buildings, but are not content unless we turn our old buildings to ridicule, and in so doing emulate the modern saints who press the music-hall song into their daily services. In every street rise creations oozy with midnight oil, written over with worn colloquialisms and abraded forms of speech. We get visions of the tired worker on the drawing board, striving with a limited vocabulary to express the unlimited aspirations of his mind and the limited needs of his century. K.

On Reflection.

Cleanliness. To erect a railway station capable of being kept clean, and possessing a scheme of colour decoration, would, twenty years ago, have seemed an impossibility. Yet the new Central Station at Nottingham possesses both these features. So much is due to the use of glazed bricks and glazed ware. The colours employed are cream, light brown and a soft sage green, and the effect is very good. These colours extend even to the signboards, ironwork, and the luggage trolleys. We might here point out that the polished pitch-pine for the doors, window frames, panelling, &c., is an atrocity, and absurd in a station where hard wear may be expected, also that brass toe and protection plates do not go well with it. Moreover, the whole of the pitch-pine work is badly wrought. Our object in mentioning this station, however, was not to enumerate its defects, but to show how, in a place so essentially liable to soot and grime, dirt is successfully combatted by the use of suitable materials. And how much more glazed work might be used in our domestic building, and with advantage. What material is so suitable for kitchen, scullery and pantry walls? In the nursery, and in the living rooms of artisans dwellings, wherever there are many children, what dirt and squalor might be avoided by the use of a glazed dado. Go into such rooms or passages, and see how easily the greasy marks on the walls might be avoided by the use of a glazed material. The wealth of tints in which glazed work is now turned out precludes any objection on the score of colour. Ah, but the expense! Yes, probably a little expensive; but there are many necessary things in building for which money is always forthcoming. Make this a necessity. Possibly some gim-crack exterior ornament will have to go; but its loss will be a gain to your house and to the community at large.

Architects and the Public.

THE "Daily Chronicle" feels that "architects are, in a measure, responsible for the indifference of the public to the Architectural Room" at the Royal Academy, and our contemporary gives as the reason that architects in their "finished designs are as entirely formal and technical as in their plans and elevations. The plans and elevations, of course, are all-important and indispensable, but there is no logical objection to the finished design looking like a real house, or church, or public building." Now while we agree with the first part of the statement, we by no means concur in the reason following. There probably has never been such a year when so many objections have been launched against the architectural exhibits on the ground that the majority are more notable as pictures than as architectural drawings. We make no apology for quoting further from our contemporary, because the writer—evidently a layman in matters architectural—unconsciously gives the true reason between his lines. Only a few works in the architectural room are noticed, but the lay mind, selecting the works it likes, finds Mr. Macartney's houses are "simple and stately and spacious." Mr. Reginald Blomfield's house in New York is evidently *harmonious* in its proportions, and *sober* in its ornament. The halls and public buildings of Mr. Belcher and Mr. Brydon have a feeling of *bigness*; so, too, have the municipal buildings of Messrs. Russell, Mallows and Grocock. Pick out the adjectives and you have at once the qualities the lay mind looks for in architecture. Buildings to please the public must be dignified, symmetrical, and big. The people who, like the writer in the May issue of the A.A. notes, affect to believe that public

appreciation of a building is its artistic condemnation, and that the public should be regarded as "a hulking mongrel cur gorging with concentrated attentiveness the offal in the gutter" (pretty simile, this) will hardly agree with this conclusion; but they may be safely left to the contents of the gutter with which they are so well acquainted. We make as our point the fact that a building showing an earnest attempt to embody the three qualities given above has never been condemned by the public. After all, it is perfectly natural. We are attracted by opposite qualities, and the rush, bustle, and indignity of life in the present age engenders a love of symmetry and repose in our buildings. If the placid, artistic Greeks (who, by the way, did not disdain public applause) found stately and symmetrical buildings a necessity, how much more should we desire them? But the keynote of the present day is "conglomeration." We have no system of planning, and there is no attempt to keep void over void and wall upon wall. The rooms are planned anyhow and without regard to a symmetrical elevation. The result is a maddening confusion of bays, windows, roofs, turrets, and gables, bewildering and irritating to the eye. Look at the Royal Academy drawings, or the Soane medalion drawing this year, where the architect, forced to the unusual work of a symmetrical exterior, was absolutely lost as to his interior arrangement. So long as our architects disdain Architecture and design conglomerations of rooms, so long will the public be indifferent to the claims of their art.

The Vestryman.

WHEN one vestryman suggests that an esteemed confrère was not in "a proper condition" at the last meeting, and the individual indicated retorts that his equally esteemed brother vestryman is "a dirty little squirt," ditto "hound," also "a filthy little humbug," asks why he has not paid his milk bill, and refers in a general way to the speeches of his fellow members as "cackle," there is liable to be trouble. One's thoughts naturally revert to the legend of Truthful James and the Society of the Stanislaus in reading the report of of the Newington Vestry from which these classic phrases have been extracted. The Spirit of Disorder is a fairly regular attendant at our London Vestry meetings, notably at Fulham, Battersea, Bromley, and also at the West Ham Council. At Bromley the members refuse to elect a chairman, and spend their time "Pretoriating," as a contemporary has it. A fortnight ago they appealed to the police to keep the peace, and an inspector sat down in their midst, to lecture them on their behaviour, and the sin of idle laughter which is as the crackling of thorns under the pot. We have a grievance against that inspector. He may be an excellent man in many respects, a model officer, a strict disciplinarian, and a credit to the force; but as a diplomat he lacks that tact, that cold purpose, that iron resolution, which effects great enterprises. His duty was plain. He should have gone out and locked the door and kept it locked for a week, and if the building was then still standing he could have gone in and kept the pieces, and Bromley would now be in a position to elect a board that would attend strictly to business. At the last Bromley meeting a Mr. Bird was nominated for the chairmanship, but he positively refused to accept the honour, in spite of the entreating strains of "Come, Birdie, Come!" Seriously speaking, these scenes are a disgrace to civilisation; but the remedy is in the hands of the ratepayers, and if they won't exert themselves they must continue to suffer.

THE LATE MR. CHARLES BARRY.

By R. STEPHEN AYLING, A.R.I.B.A.

THERE has just passed away at the age of seventy-seven one of the most prominent members of the architectural profession. Mr. Charles Barry, past president R.I.B.A., F.S.I., F.S.A., was the eldest son of the late Sir Charles Barry, R.A., and was educated at Sevenoaks Grammar School. On leaving there, he was articled to his father, whom he assisted for some years, notably during the latter part of the time whilst the Houses of Parliament were being built. Some few years back, Mr. Barry prepared a scheme for the completion of the Houses of Parliament, modified from the plan left by the late Sir Charles Barry, but the work was unfortunately not carried out. He started practice on his own account in 1849, and shortly afterwards took into partnership the late Mr. Robert R. Banks, who had been his father's chief assistant. Mr. Banks died in 1872. Mr. Barry then continued the practice alone until about three years ago, when he took into partnership his eldest son, Mr. Charles Edward Barry. During a period of more than fifty years Mr. Barry executed commissions for nearly every kind of building, ecclesiastical, civil and domestic. To mention one tithe of them would occupy a large space, but among the most important may be enumerated the following:—

Mansions.—Bridgewater House (1848); Bylaugh Hall, Norfolk (1849); "Dornden" (1850); "Highgrounds" (1850); Duncombe Park (1851); Preston Hall (1863); Bramley House (1867); "Stevenstone" (1869); and the rebuilding of "Clumber," after it was destroyed by fire, for the Duke of Newcastle.

Churches.—Bilsdale Church (1851); Hurstpierpoint Church (1857); Harum Chapel (1861); Holy Trinity Church, Barking (1865); Helmsley Church (1866); St. Stephen's Church, Dulwich (1867); All Saints' Church, Whitstable (1874); St. Peter's Church, Dulwich (1873); Christ Church, North Dulwich; and quite recently the new Mission Hall at Herne Hill, being part of a large scheme to include also a church and parsonage.

Schools.—Infant Schools, Stepney (1856); Girls' School, Dulwich (1865); Schools at Bolney (1869); Winchester Street Schools for the London School Board (1873); Bedfont Industrial Schools (1880).

Baths.—Preston (1850); Bermondsey (1853); Alleyn College, Dulwich, with gymnasium (1887).

Mr. Barry was for many years the architect to the London Hospital, and during that time erected the new Grocers' and Alexandra wings, mortuaries, stables, workshops, &c. In 1890 he carried out the new Jubilee wing at the Hospital for Sick Children, Great Ormond Street. Among other buildings may be mentioned Westminster Chambers (1863), Burlington House (1868), and the metropolitan artisans' dwellings at Battersea and Islington (1876-9). A few years ago Mr. Barry carried out the work of roofing in the area of the Royal Exchange, which commission he won in competition with seven other architects. Among the most recent commissions were the Passmore Edwards Library at Dulwich and the Institution of Civil Engineers in Great George Street, Westminster, shortly to be demolished to make room for the new Government buildings. Since 1858 Mr. Barry held the post of architect and surveyor to the Dulwich Estate, and during that time designed the New College and about thirty houses and other buildings on the property.

Having been elected president of the R.I.B.A., in 1876, he held that office for three years, and was chosen to receive the Queen's gold medal in 1877, this being the only case in which that honour has been conferred on father and son. Mr. Barry was appointed by H.R.H. the Prince of Wales as sole Commissioner for England and the Colonies for Architecture in the Fine Art Section of the Paris Exhibition (1878), and at its conclusion was made an "Officer of the Legion of Honour" of France.

Mr. Barry was frequently appointed as assessor in competitions, and but few knew the infinite amount of trouble he took before making his award. Every detail was studied, and marks given under different heads. I remember in one instance local influence was strongly in favour of the competitor he had

THE LATE MR. CHARLES BARRY, F.R.I.B.A.,
F.S.I., F.S.A.

placed third, and the Committee wished to put the work in his hands. The assessor took the matter up most warmly, and after great trouble succeeded in obtaining the commission for the gentleman who had honestly won the competition. Mr. Barry himself, always enthusiastic, seemed to infuse enthusiasm into those around him, and it would be easy to mention many of his pupils who are now eminent in the profession. Invariably courteous and genial, he was respected by those who only

• THE INSTITUTION OF CIVIL ENGINEERS •

ELEVATION TOWARDS GREAT GEORGE ST

BRISTOL TO SOUTH WALES DIRECT LINE. DOTTED LINES SHOW NEW WORK; BLACK LINE SHOWS EXISTING MAIN LINE.

knew him slightly, whilst those who were privileged to enjoy his friendship regarded him with a feeling akin to affection.

An honourable, kindly gentleman has passed away, and one whose loss will be keenly felt.

THE WAKENING OF THE GREAT WESTERN RAILWAY.

NEWSPAPER readers diligent in the reading of railway paragraphs have been familiar during these last few years with items of news detailing, more or less correctly, the different accelerations of West of England traffic and the several minor extensions of the Great Western system in Devon and Cornwall. Not, however, for several years past has the Great Western Railway had so many important schemes on hand as now. Indeed, until 1891, or thereabouts, the Great Western, it is safe to say, was the least progressive line in England—an inert corporation superior alike to criticism or the pricks and goads of competition. It had, in fact, well earned the name of the “sleepy giant,” and no new thing was to be looked for from the offices at Paddington or from the works at Swindon. Enginemen, guards, and porters had grown grey in the service of the line, and the identical trains that ran in their youth were yet running in their old age. Suddenly, however, the repose of these venerable servitors was rudely shaken, and the time-tables that had remained so many years unaltered became entirely changed. Old trains that had outworn their popularity or had survived the needs that had called them into existence were taken off and replaced by new and quicker ones at different hours; regulations framed in days when railways were yet on their trial were relaxed, and the stations began to be rebuilt.

The men who had made the Great Western had by this time passed away; Brunel many years previously, and Saunders, the secretary, some five years later; to be followed, within recent years, by Mr. Grierson and Sir Daniel Gooch. They had clung to the broad gauge, and found no need for revision of train services; but no sooner had the last of them disappeared from the councils of the line than the broad gauge was doomed, and the time-tables began their long career of revision which is by no means done yet.

How important the policy of the Great Western management is to the travelling public of this country can be no better shown than by a comparison of it with the London and North-Western Railway, which is often cited as the premier railway of England. The Great Western has the advantage in mere mileage, working as it does 2,599 miles, as against the North-Western's 1,892 miles. It is in capital and revenue that it comes second, with a capital of £83,563,000 and a revenue of £9,878,465, as against the North-Western's figures, respectively, of £117,269,000 and £13,155,925.

It is, of course, chiefly by reason of its splendid carrying trade in coals and minerals that the North-Western bulks so largely, penetrating as it does by a direct route from London into the very heart of the colliery and manufacturing districts, while the Great Western is pre-eminently the tourist's line, and one practically undeveloped. It has become a truism among railway men that it is not by passenger traffic that big dividends are earned, and this has evidently been taken to heart by the Great Western directorate, who have a scheme formulating by which the rich collecting grounds of goods and manufacturers may be reached by a shorter route than that at present taken. But more of this presently.

That the Great Western has splendid opportunities for development must be evident to any who take up the map of that great system, whose two great arms, branching out from Reading, clasp severally the tourist's paradise of the south-west, and the rich and varied interests that are comprised within the manufacturing West Midlands and the busy coalfields and clanging workshops of South Wales. For, despite all its splendid engineering achievements in the peculiarly difficult districts through which it runs, and notwithstanding the historical change of gauge close upon five years ago, the Great Western is still largely an undeveloped line, and the present directorate seem to be alive to this fact and to the necessity of altering it.

The Great Western has ever been a line to gain the affections of travellers. Whether this is due to the courtesy that has always distinguished its officials above those of other great railways, or whether it is due partly to

the picturesque districts it traverses, and in degree to the sentimental regard frequenters of the line had for the old Broad Gauge, who shall say? Probably it was owing equally to all three causes. Certainly when the 7ft. gauge disappeared in May, 1892, to give place to the narrow gauge of 4ft. 8½in., there was a break with the old traditions which was bitterly regretted by West Country folk; and now that the line has been remodelled throughout Cornwall, and the many old timber viaducts, so characteristic of the Great Western and its leased lines in that county, have been rebuilt in more enduring but less picturesque granite, everything seems strange to those who knew the Great Western of old. But railways, like everything else, must move with the times, and the Great Western has an alert rival in the South-Western. It matters little, however, on the main line that the South-Western has penetrated beyond Exeter, through Devon into the far west of Cornwall; for who, having once tried the South-Western route, would elect to travel by it again? But, with the works now in progress, which will give the Great Western a new and shorter main line to all stations beyond Taunton, competition by the rival for swift and easy transit to the West will be quite out of the question.

A glance at the accompanying sketch map will show how many and important are the changes to come over the Great Western's system in the near future. The old main line to the West, still in use, passing through Reading, Didcot, Swindon, Bath, and Bristol, is to be supplanted by a new and shorter route diverging from the old one at Reading and

GREAT WESTERN RAILWAY: NEW LINES AND CONNECTIONS.

going by way of Newbury and Westbury, re-joining the old main line at Durston Junction, just short of Taunton. The greater part of this newer route has been in existence for many years past as the "Hants and Berks" branch to Newbury, Hungerford and Devizes, and in the shape of other short lines in mid-Somerset. For at least twenty-five years past those who have been familiar with Great Western maps of these districts have noticed two short connecting links of railway on this route marked as "lines authorised and in progress." These are those which, when completed, will give a short and level road to the West, saving nineteen miles in distance and much more in the avoidance of the heavy gradients on the existing route. The links in question are those between Stert and Westbury, and between Castle Cary and Langport, and have been under construction during the last three years. The country traversed is an easy one, lying as it does in the valleys of the Kennet and the Frome, and thence along the almost dead levels of the southern border of Sedgemoor and through the Isle of Athelney. Widenings of the existing branches and relaying, to fit them for the needs of an express route, are also in progress, so that in the near future we shall see the West of England expresses altogether deserting the historic way, through Swindon and Bristol.

OLD ATMOSPHERIC ENGINE-HOUSE, TOTNES.

The opening of the Severn Tunnel in 1886, giving a more direct access to the South Wales coal-fields and seaports, brought a great increase of every description of traffic over the main line, and congestion has almost ever since been its normal condition. Even the great station at Bristol, once thought large enough for all time, is too small for present needs; and the relief afforded by sending the Devon and Cornwall traffic another way will be welcomed.

But even the present route to South Wales is shortly to be modified and Bristol further relieved by the huge coal traffic that now passes through it being diverted over the "Bristol and South Wales Direct" line under construction by the Great Western since 1897, and shortly to be opened. This railway, designed almost wholly for the coal traffic, will bring the products of the South Wales coal-fields through the Severn Tunnel without touching Bristol. The line is thirty-three and a half miles in length, and will save eleven miles over the old route. A spur line conducting into Bristol between Winterbourne and Filton will save four miles over the route from London to Bristol now in use. Branching off from Wootton Bassett, the "Bristol and South Wales Direct" goes through some very heavy country, entailing many engineering works of importance. The Cotswold Hills have been pierced by three tunnels, and four long viaducts have been made. The longest tunnel, between Badminton and Chipping Sodbury, is two and a half miles; the longest viaduct, that of Huckford, 230yds. The cost of this line is put at a little over £1,000,000. In spite of the difficulties of the country, the line has been engineered with the easy ruling gradient of 1 in 300, and with a minimum curve of one mile radius. With a road thus practically level and straight, quick running will be easily made.

The projected short cut from Newnham-on-Severn, or Awre, to Stonehouse, in Gloucestershire, is apparently not yet to be put in hand.

PARSON TUNNEL.

When constructed it will do for Hereford and places beyond, although on a smaller scale, exactly what the Severn Tunnel is now doing for South Wales, cutting off as it will the detour by Gloucester.

Some interesting changes are about to take place on the Exeter to Totnes section, once the South Devon Railway, and worked in the old days by the atmospheric system instead of with locomotives. Great advances have already been made towards rendering this section and those beyond it worthy of being portions of the main line of a progressive railway, but more remains to be done, particularly between Dawlish and Teignmouth, where the line runs on the sea shore and for more than a mile through a series of five tunnels cut through the red sandstone cliffs. Constructed originally with only one track through these tunnels, the traffic has grown until the delay caused by working every description of train through from Dawlish Station to the signal box at the Teignmouth end of the Parson Tunnel, and *vice-versa*, by the aid of the staff system, can no longer be endured. It is, indeed, an anachronism that a stretch of single line should survive to this day on the main line of one of our foremost railways; but it is an anachronism shortly to disappear, now that these tunnels are to be doubled. It is a picturesque portion of the railway, between this point and Starcross, and on again westwards to Newton

Abbot and Totnes, and few natural compositions for a picture are so pleasing as that afforded by a view down the estuary of the Exe, near Starcross station, where the red sandstone tower of the obsolete old engine-house of the atmospheric railway stands out boldly against the sky, by the dingy sheds of the station. There is talk of rebuilding the station, but if this is done the old tower might be spared again, as it was on another occasion, when it was allowed to remain at the request of the late Earl of Devon, whose seat Powderham Castle, adjoins. Another of these old engine-houses remains, outside Totnes station, and a portion of one at Newton Abbot.

Coming near London, we find some highly interesting works, which, in themselves and in their relation with works jointly undertaken by the Great Western and the Great Central Railways, will have an important bearing upon railway communication with the Midlands. A Bill was introduced into Parliament in 1897, and passed, for the making of a railway to branch from the Great Western system at Old Oak Common, on the borders of Wormwood Scrubbs, and to continue through Middlesex and Buckinghamshire to form a junction with the High Wycombe branch on the east side of High Wycombe station; opening up a new suburban district on the way, with stations at Twyford Abbey, Northolt, Ruislip, Denham, Gerrard's Cross, and Beaconsfield. The distance

STARCROSS.

by rail from Paddington to High Wycombe, avoiding the change and circuitous route by way of Maidenhead, will be, by the new line, twenty-six miles, instead of thirty-four, and incidentally the distance to Oxford and places beyond is similarly shortened by this route, preferable over the usual journey, *via* Reading and Didcot. Significant also is the fact that by this line a saving of time and mileage to Warwick and Birmingham will be effected.

The long-developing quarrel between the Metropolitan and the Great Central Railway Companies had unlooked for results in leading to an arrangement between the Great Western and the Great Central by which the G.C.R. will construct a line from its system at Grendon Underwood, a point between Calvert and Quainton Road, to meet a re-modelled and extended Great Western branch from High Wycombe to Prince's Risborough, Great Central trains thus being provided with a through run past High Wycombe on to Northolt, where they will quit the Great Western's new line and proceed by a short Great Central link, authorised from Northolt to Neasden in 1898, and thence over existing Great Central rails from Neasden to

LIVERPOOL'S NEW COUNCIL CHAMBER.

THE alterations to the Council Chamber at the Liverpool Town Hall, which have now been completed, were commenced twelve months ago, and have been carried out according to the designs of the city surveyor, Mr. Sheldermine, who has been assisted by Mr. John H. Dawson. The old floor has been lowered 18in. on the east, west, and south sides, and also at the Lord Mayor's dais and gangways adjoining, whilst the central portion of the floor has been taken 3ft. below the old level. The space between the upper and lower levels is in tiers, elliptical on plan, and on these tiers are the seats for the councillors, each row of seats being 4½in. higher than that immediately in front. The new floor is constructed of concrete and steel joists, on which are laid pitch-pine blocks, the risers to the various tiers being of teak. On taking out the old windows and stripping the walls, a lot of timber-work was found to be built into the

parts being decorated with gold. In extending the building, Darley Dale stone has been used, being made to correspond as far as possible with the old work. The columns and caps facing "the flags" have been rebuilt 7ft. nearer the Exchange, the space thus formed between the external wall of the main building and the front of the new projection making a portico similar to the one facing Castle Street, and taking the place of the "Queen's balcony," which has been removed, whilst the statues that surmounted the entablature have been renovated and placed in new positions. The principal contractors for the work were Messrs. Brown and Backhouse, who did the whole of the structural work, as well as the mahogany work in the dado, windows and doors, Messrs. Waring and Gillow, Ltd., being entrusted with the decorative work, and Messrs. G. H. Morton and Son with the furniture. The heating and ventilation were carried out by Messrs. Dargue, Griffiths and Co., and the electric fittings were supplied by Messrs. Singer and Co., of Frome. Mr. E. Shakespeare acted as clerk of the works.

EXTENSION OF WAKEFIELD CATHEDRAL.

SOME time ago the clergy and laity in the diocese of Wakefield determined to promote a memorial to the late Dr. Walsham How, the first bishop of that diocese, and decided that the memorial should take the form of an enlargement of Wakefield Cathedral, into which should be introduced a recumbent effigy of the late beloved bishop. Early in the present year tenders were invited for the work, and eleven were received. After consideration, the committee accepted the tender of Messrs. Armitage and Hodgson, of Leeds, who erected the County Hall and the new Acute West Riding Asylum at Wakefield; and for some weeks that firm has been carrying out certain preliminaries on the site, which had been cleared of the shops, &c., by Mr. Wilson, contractor, Park Lane, Wakefield. The amount of Messrs. Armitage and Hodgson's contract is £25,100, but the contract has been divided into two, so that the first portion of the work—including a chapter house and two new vestries—will be entirely completed before the second portion of the work is proceeded with.

The plans of the proposed extension have been prepared by Mr. Frank Pearson, of London. They provide for the extension of the chancel eastwards, besides giving increased length to the choir, which, it is said, has long been much needed, and also provide retro-choir, the approach from which, and forming a continuation of it, will be a chapel, which, together with the retro-choir, will give ample accommodation for early and occasional services. The total extension eastwards will be about sixty yards. The chancel aisles are to be extended eastward to the same length as the retro-choir, and this extension will take the form of north and south transepts, with eastern aisles. The transepts, by their spaciousness, will contribute very much to the dignity and cathedral-like aspect of the interior of the fine old church, and they will also form a break in the long horizontal lines of roofs and parapets. By means of this extension there will be ample room beneath for a chapter house and complete vestry accommodation, which, owing to a natural slope, will be well lighted. Access to these vestries will be obtained by a wide staircase on the north side, and there will also be an external entrance to them on the south side. The extension of the chancel will allow the altar to be moved one bay eastward, and behind the altar, and dividing the chapel, will be the altar screen. Under an arch on the north side of the sanctuary it is proposed to place a canopied tomb, with a recumbent effigy of the late bishop. Opposite to this will be the sedilia and credence stool. The position of the choir stalls and the bishop's throne are to be altered, so as to provide for a choir of thirty-four in a block of stalls three deep on each side.

TUNNEL, LEA MOUNT, DAWLISH.

Marylebone, thus rendering it unnecessary to exercise running powers over the Metropolitan extension to Quainton Road, and effectually defeating the Metropolitan's obstructive schemes. The day has not yet arrived when, in pursuance of this compact between the Great Western and the Great Central, the latter's trains will run, unchecked, into or out of Marylebone, but the branches are in progress, and another two years should see their completion.

Enough has now been said to show how extensive and varied are the new interests of the Great Western and to explain the maps illustrating these remarks. C. G. H.

FREE INSURANCE FOR OUR READERS.—We have made arrangements with the Credit Assurance and Guarantee Corporation, Limited, by which we secure for our readers a guarantee of £100 in the event of a fatal railway accident. The coupon setting forth the requirements to be complied with in order to make this guarantee valid will be found on another page.

walls, and this proved to be infected with dry rot; in addition a considerable portion of the brickwork was discovered to be in a very bad state, and the beams supporting the ballroom floor were found to be practically unsafe in parts. These difficulties were successfully overcome by the removal of the old woodwork and the brickwork, and making good and inserting in the ballroom floor steel girders and additional timber beams. In making the new recess on the north side, the old external wall had to be cut away and new steel girders inserted to carry the wall over the ballroom floor. The following dimensions show what a change has been effected:—Old chamber, height 17ft. 6in., length 63ft. 3in., width 38ft.; new chamber, 19ft. and 20ft. 6in. at lowest and highest parts, length 89ft., width 40ft. 6in. The interior of the new room is lined all round with a panelled mahogany dado 12ft. high with entablature, whilst the windows have quarter-circle jambs with columns on square pedestals and are surmounted by segmental pediments with panelled soffits. The ceiling is in fibrous plaster, divided into three parts by a deep and highly enriched entablature extending across the chamber, and resting at each end on Ionic pilasters of mahogany. The walls between the top of the dado and ceiling are hung with Tynecastle canvas decorated in gold and colour, and the ceiling is treated in tones of ivory, buff and cinnamon, the ornamental

THE CONSTRUCTION OF TEMPORARY BRIDGES.*

By G. ELLIS, A.B.I.C.C.

FIGS. 1 and 2 of the accompanying illustrations show a typical example of a timber footbridge of a temporary character, such as those which are used in spanning excavated roadways during building operations. One of the first requirements that the carpenter has to comply with in work of this description is that the material used in construction shall be cut and otherwise injured as little as possible, in order that it may be subsequently used for other purposes with slight loss. Therefore, in designing these structures, attention should be given to the market sizes of timber, and the parts arranged accordingly. The bridge illustrated is composed of a number of 9in. by 3in. deals laid on edge at short intervals across the opening,

with the braces must be so arranged, that in whatever direction the load may act some of them will be thrown into compression by it. This is one of the most important points to be considered in bridge building, and is equally necessary whether the trussing be constructed above, or below, the roadway. A design for a temporary carriage bridge over a river is shown in Fig. 6, 7 and 8. The construction is again that of converting the parapet frames into trussed girders to support the central parts of the span, and, as struts beneath the bridge would interfere with the navigation of the waterway, cantilever beams C are employed to reduce the effective span between the piers. These piers are formed of double rows of whole-timber piles, driven deep into the river bed, their heads being connected by cap pieces E, of 12in. by 9in. timber, fixed by stub mortice and tenon and pinned; upon these are laid transverse sleepers, F, 12in. by 9in., secured by 1in. wrought-iron bolts. These sleepers run over the piers, at each end about 2ft. to form bases for the ends of the raking

piling at slightly higher levels from the banks to the centre. The chief dangers to be guarded against in this form of construction are, the pressure of the wind on the sides of the bridge, and damage to the piers by drifting craft, &c., on the stream. The first is minimised by the open character of the framing, and counteracted by the raking braces of the parapet and the inclined walings on the piles shown in the section, Fig. 8. Damage to the piers by floating ice or drifting craft can be provided against by driving fender piles at each end, and about 10ft. in front of the piers, in the form of a triangle, with the base towards the bridge. These should rise about 3ft. above high-water level, and should have stout stringers bolted on each side about 1ft. apart, their sharp ends being protected with iron plates. The details of the construction of this bridge are similar to those shown in Figs. 3, 4 and 5. To prevent timber used in bridge construction rotting, it should be coated with Stockholm tar and dusted with fine sand whilst wet; all the under part should be left

resting on a transverse sleeper at each end and being supported in the middle by braces springing from planks embedded in the sides of the excavation. The top ends of these braces abut against straining beams, which in turn abut against the cross-tie A that connects the intermediate beams to the outer ones, and transmits their load to them. These outer beams are formed into trusses by means of the handrails, posts and diagonal braces, and are framed together in the manner shown in the details, Figs. 3, 4 and 5. The end posts are in each case taken down to the foot of the lower bracing, and there bolted. The diagonal bracing adds greatly to the strength of the bridge and is necessary because the load is a varying and moving one, consequently the same brace is, at different times, called upon to bear compressional and tensional stresses. Now wood in the form of a brace or strut acts very effectively when stressed or compressed in the direction of its length, but very indifferently when stretched or stressed tensionally, as practically the whole of the stress has then to be borne by the fastening or joint, which is constructively the weakest part; therefore, when a moving load has to be dealt

struts D and the feet of the central trusses, which, whilst assisting in supporting the weight between the piers, also prevent the parapets overturning. As will be seen by reference to the plan, corresponding members are brought down from the straining piece, inside, to withstand the pressure of the wind. The roadway is formed of 6in. die-square timbers closely laid and spiked to half-timber beams of 12in. by 6in. Memel fir, carried by cantilever beams, 9in. by 6in., to which they are bolted with 1in. bolts, the heads and nuts being bedded on 4in. by 3in. square washers. The carriage-way is covered with asphalted gravel, and the footways constructed of 9in. by 3in. deals resting on longitudinal joists, with short cross-pieces framed between at short intervals. The path is curved with 8ft. lengths of 6ft. by 6in. timber, and a half-round gutter is formed in the asphalt at each edge of the road; holes are bored at short intervals in the footway to let the surface-water escape. In addition to the transverse curvature of the road surface shown in the section, Fig. 8, a slight rise is also given to the bridge longitudinally to assist the escape of rainwater. This is accomplished by keeping the various rows of

open for the access of air; ample provision should be made for the escape of rainwater; and the joints of the flooring should be left slightly open as a provision for expansion. If dry sand is intended to be used to make up the carriage-way, a layer of well-puddled clay should first be laid over the timbers to prevent its escape through the joints.

Blackfriars Priory: Further Discoveries.—In our issues for May 9th and 16th last particulars were given of the discovery of remains of the Dominican Priory at Blackfriars. It is now found that the north wall of the demolished building contains throughout its whole length of about 60ft. remains of the ancient wall of the apartment which has been excavated. On Saturday the base of a column, in a most perfect condition, was unearthed close by the perfect upright column that was lately found, and in a situation from east to west, showing that it was one of many that supported a groined arched roof. More foundations of walls have come to light, and a vault has been discovered beneath what was the floor level. The clearing of the latter, it is thought, may lead to further discoveries.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Surveying with Theodolite.

HALIFAX.—NOVICE writes: "Please give an example of field booking and plotting lines, or name a practical work on trigonometrical surveying for a student."

Obtain Middleton's "Surveying and Surveying Instruments" (Whittaker and Co., Paternoster Square, E.C., price 3s. 9d.).

R. W. C.

Day's Slop-Closets.

RAMSEY, I.M.—J. J. B. writes: "Where can I obtain information respecting Day's slop-closets?"

A patent was taken out on October 19th, 1891, by Mr. John Day (it is numbered 17,863) for a slop-closet, and another on August 17th, 1892 (numbered 14,868). These specifications are obtainable at the Patent Office, Chancery Lane, price 8d. each. As far as we know, Mr. Day's address is 26, Canal Street, Wolverhampton.

Measuring from Plans.

SEAFORTH, LIVERPOOL.—KRUGER writes: "Supposing you had a sketch plan like subjoined (not reproduced), what and how would you measure off from it? Is the difference in the levels feet or inches. Does 21'48 stand for decimals?"

The levels are given in feet and decimal parts of a foot above an assumed plane, known as a datum, evidently taken in this instance 20ft. below a bench mark on curb in "Crescent Road" opposite the end of fence.

G. A. T. M.

Architects' Charges.

CHESTERFIELD.—GOTHIC writes: "Please say where I can obtain a copy of the R.I.B.A. schedule of fees for the remuneration of architects."

A copy of the schedule of architects' charges issued by the Royal Institute of British Architects is obtainable for sixpence. The R.I.B.A. Kalender is only half-a-crown, and contains, amongst other things, all the official publications, including the one mentioned. The Institute's offices are at 9, Conduit Street, W.

Constructing a Skittle-Alley.

CATFORD.—TOWSE writes: "In reference to the paragraph on 'Constructing a Skittle-Alley,' on page 45 of your issue for February 21st last, does the 12ft. 6in. wide include the channel for the return balls to run back in? Also, what is the size of pocket at the end of the alley which receives the balls; is it only a channel?"

The width of 12ft. 6in. should be exclusive of the channel, otherwise the sketch submitted is perfectly correct. The pocket to receive the balls may be of any convenient size.

G. A. T. M.

Reading a Vernier Scale.

HESSLE, HULL.—IGNORAMUS writes: "I shall be glad if you will explain the mode of reading a Vernier scale on a box-sextant. Please also give an example of an angle read and the positions one takes to read it."

The Vernier scale on the box-sextant is read precisely similarly to that on the theodolite. If, for instance, the arrow on the Vernier points between 12deg. 30min. and 13deg. on the main scale, not coinciding with either,

while the line denoting 14min. on the Vernier corresponds with some line (it matters not what line) on the main scale, then the total reading is: 12deg. 30min. + 14min. or 12deg. 44min. For more detailed information it would be well to consult Middleton's "Surveying and Surveying Instruments" (Whittaker and Co.).

G. A. T. M.

Adjoining Owners and Land Support.

PARKSTONE, DORSET.—PRETORIA writes: "A is the owner of the pieces of land marked B and C on the accompanying sketch. He lets the portion marked B to a brick manufacturer to be used for the purpose of excavating clay, and also lets the portion marked C to another person to be used as a building site. Is B therefore at liberty to dig down in a perpendicular direction, so causing a portion of C's land to give way, as shown by dotted lines X-Y; or is he compelled to leave some support, either by leaving a batter as shown by dotted lines N-M, or by building a retaining wall? Or is the lessor to make all provision for this? B's and C's leases do not say anything about any support being left, and B claims the right to dig down in a perpendicular direction, as he says if he left a batter he is not getting his full amount of clay."

Assuming that nothing has been done on the plot marked C to increase the lateral pressure towards the plot marked B, the giving way of the soil of C being thus the natural and necessary effect of the withdrawal of the support afforded by the soil of B, the tenant of

ADJOINING OWNERS AND LAND SUPPORT.

C is entitled to have that support replaced in such a way as to prevent the continuance or recurrence of the injury to the soil of his plot. The law is that each adjoining owner is entitled to the support of his neighbour's soil for the soil of his own land, so long as his own land remains in its natural state and is not so altered as having, for example, buildings erected on it close to the boundary, causing the lateral pressure which the adjacent soil has to bear to be increased. After the lapse of twenty years the right to support from the adjacent soil to a building erected close, or near, to the boundary may be acquired; but, apparently, in the present case, no question of that kind arises. How the support which B is to afford to C's land is provided is immaterial. B may effect it in any way he chooses, provided it is sufficient to replace that which he withdraws.

H. P. B.

Brick Spires with Stone Bands.

NORTHAMPTON.—OBERON writes: "In making a design for a proposed church to be built of brick, with stone dressings and bands, I purpose erecting a tower with a brick spire relieved with stone bands at intervals. Is there any objection to such a spire, either from a practical or artistic point of view? No doubt it will be said that a lead spire would be the correct thing to have, but I should like to have an authoritative opinion as to a brick spire with stone dressings."

Brick spires with stone bands, though rare in this country, are by no means uncommon

in Holland and North Germany. They are a perfectly logical outcome of brick building, to which no reasonable objection could possibly be taken.

G. A. T. M.

Allowances to Builders.

HALIFAX.—FAIRATION writes: "Where a provisional sum for contingencies is included in the quantities, and the contract balance has been considerably delayed beyond the usual three months after completion of work, as stipulated, is not the architect justified in making an allowance to the builder out of the sum for contingencies for inconvenience and loss of interest?"

The architect has no power either to delay the issue of his certificate, or to issue it for a larger sum than the balance actually due. If the architect delays issue of certificate for the cause stated he becomes liable to the contractor for damages. The contractor should, by being given the certificate, be put in a position to exact payment when it is due.

G. A. T. M.

Excluding Surface Water from Wells.

BILDESTON, SUFFOLK.—J. H. C. writes: "Can you supply me with the address of a firm that supplies iron or steel cylinders suitable for lining a well in order to keep out surface water? Which is the cheapest way to keep out surface water from a well that is dug into the chalk? The chalk is about 20ft. from the surface, and just above it is a bed of stone and sand mixed, which is full of surface water; this contaminates the water from the chalk below."

Cast-iron cylinders for wells may be obtained from the Stanton Ironworks Company, Limited, near Nottingham, whilst both cast and wrought iron lining tubes are manufactured by Messrs. Pearsons and Knowles Iron Company, Limited, Warrington. An economical method of excluding surface water from shallow wells of small diameter is to line them with rock concrete tubes, and fill in behind with a thick backing of well-puddled clay, thoroughly rammed. The rock concrete tubes are made by Messrs. Sharp, Jones and Co., Parkstone, Dorset. They are obtained in 2ft. to 3ft. lengths, and when fixed should be well bedded and jointed in neat Portland cement.

T. E. C.

Cess Pools.

WIMBANE.—E. T. B. writes: "Is it desirable for a cesspool for a private house in a small town to have a fresh-air inlet with mica flap head, as well as an outlet shaft, which is carried up above the eaves? I may say that the cesspool is close to the house (within 30ft.), and cannot be placed further away. The surveyor to the authority insists on a fresh-air inlet being provided. In theory the inlet may be perfect, but in actual practice I have noticed many times that it acts as an outlet; especially is this the case on a hot summer day, when there is not sufficient movement in the air to cause a draught. The mica flap is by no means a perfect valve and is generally missing from the inlet head. Is not the 4in. outlet shaft quite sufficient to carry off any gas that may generate in the cesspool? Of course the drains are disconnected from the cesspool and have a system of inlet and outlet ventilators."

It is very desirable that cesspools should be provided with a low-level fresh-air inlet in addition to a high-level foul-air extraction shaft. When the cesspool is situated at some considerable distance from inhabited buildings the fresh-air inlet may take the form of a surface grating or ventilating manhole cover. In cases such as that referred to in the query the fresh-air inlet should be fitted with a good form of mica flap-valve as a safeguard against reverse currents of air. An outlet shaft in itself is not sufficient to properly ventilate a cesspool.

T. E. C.

At Northumberland Heath, Erith, an infants' school is about to be erected from designs by Messrs. Ford, Son and Burrows, architects, of London, E.C.

"BUILDERS' JOURNAL" SHILLING FUND.

THE FINAL LIST.

WITH the list published below we close our subscription list to the BUILDERS' JOURNAL Shilling Fund, which is our readers' contribution to the Building Trades' Gift to the Nation. It will be remembered that a few weeks ago we announced our intention of closing the fund, and appealed to our readers to send in the small amount then required to make up 3,000 shillings. We are glad to say that not only the required amount but more than 600 shillings in addition have now been contributed, so that we are able to send to the treasurer of the Building Trades' Gift a cheque for £180 9s. 6d. (3,609½ shillings).

In view of the very heavy expense involved in not merely relieving a temporary distress, but providing permanent homes for many generations of soldiers who may be in need of such help, the sum mentioned is perhaps but a comparatively small contribution. But when it is remembered that the bulk of the amount is made up of very small sums which in all probability would—but for our fund—not have been contributed at all, we cannot but regard the result as eminently satisfactory, and it only remains for us to thank those of our readers who have responded to our appeals on behalf of our wounded soldiers, and especially those who have devoted some personal service to the good cause by collecting subscriptions from their employees, friends or fellow-workmen.

A new Baptist Chapel at Oldham has been built from designs by Messrs. Winder and Taylor, architects, at a cost of £5,000. It is situated in Chamber Road, and accommodates 470 worshippers. Messrs. J. and D. Blunn were the contractors.

New Bells for Beverley.—A new peal of ten bells has been hung in the tower of St. Mary's Church, Beverley. They come from the foundry of Messrs. Taylor, of Loughborough, and have a total weight of 142cwt. 20lbs. The fittings comprise all the firm's latest improvements, the frames being in massive H-shaped castings, standing upon and bolted to stout steel girders. The total cost will be about £1,600, which includes the value of the old bells, about £400.

PEKIN AND ITS BUILDINGS.

AT the present time attention is being drawn from the War that is concluding to China and the operations in progress around its capital. In the four cities which make up Peking—the Chinese, the Tartar, the Imperial, and the Forbidden—live most of the leading and opulent class, and, therefore, the houses are of a more important and solid appearance than is the rule elsewhere. High brick walls, with a single stone entrance, surround a multitude of courts, flanked by tile-roofed dwelling rooms. It is a curious and universal custom among the Chinese to put up immediately facing the outer door a stone or brick screen, bearing tablets or painted scrolls inscribed with the names of ancestors or with classical texts. The object, according to time-honoured superstition, is to ward off evil spirits. There is no attempt at ostentation, or even of decent comfort, about the dwelling-places. Within they are mere ramshackle bungalows, with stone-flagged floors and paper windows, fantastically cut up by wooden partitions, and papered without taste or cleanliness. The furniture is of polished wood made in the stiff, square style that is not unfamiliar, and ornaments are few, and of the commonest foreign make. A Chinese window is a quaint subterfuge for obscuring the light of day. It is an intricate pattern of woodwork in straight lines, with pieces of glass stuck on the surface, and filled up with strong, yellowish paper. The tiles used for roofing are rounded and well made, of various colours—yellow for the Emperor, green for the gods, blue and red for the rest—the ends are capped with a flat, embossed circle, and crested with mythical animals and horned heads. Within the Chinese city is a vast open space, the two great enclosures of which are green with trees and dedicated respectively on the north and south to the Temple of Agriculture and the Temple of Heaven. Beyond the area of temples a random aggregation of wooden shops leads up to one of the principal gates, pierced in the Tartar wall, the second and famous wall of Peking. In all, this wall is twelve miles round, flanked by protruding bastions and solidly faced with broad baked bricks, the 20ft. of space between the sides being filled with mud. A great difference exists between the Imperial capital and the provincial cities, in that the main streets of Peking are of adequate width, although stalls have been set up between the frontage and the roadway on each side. The buildings are rarely two storeys high; most of them have a flat roof, protected by a carved wooden parapet. A certain amount of fantastic carving in wood is used for external decoration, and on the wooden doors of the houses are painted the figures of Chinese gods and heroes. The infancy of the paving and road-making of Peking has passed into a proverb. Originally, the stone-flagged pass-ways that lead from the Chinese to the Tartar Wall, and to and from the several gates, must have been grand achievements, made up as they are of substantial blocks of limestone, clamped with iron bolts, but nobody has ever troubled to keep them in the slightest semblance of repair, although a large sum of money is annually paid over to the officials for the purpose. The consequence is that they are now broken up by deep ruts and cavities; moreover they are made up and repaired with the contents of the drains and cesspools. In order to keep the dust within the bounds of respiration, the roads are plentifully watered with the liquid contents of the sewers, ladled out at every hour of the day in enormous wooden spoons. Curiously enough an electric tramway now runs from the railway station for a couple of miles to the gate of the Chinese city; but in the Forbidden City, which contains the Imperial palaces, no ordinary foreigner ever sets foot. The thought comes in the present crisis: What a change from eastern to western methods would be effected if the break up of China became something more than a creation of journalists whose stock of sensational news was running rather low!

Bricks and Mortar.

APHORISM FOR THE WEEK.

<i>Nobles, discretos varones</i>	<i>Ye honourable, and wise men</i>
<i>Que gobernais à Toledo,</i>	<i>Who rule Toledo,</i>
<i>En aquestos escalones</i>	<i>On these stairs</i>
<i>De sechad las aficiones,</i>	<i>Relinquish all (your) prejudices,</i>
<i>Codicia, temor y miedo.</i>	<i>Avarice, frailty and fear.</i>
<i>Por los comunes pro- vechos</i>	<i>For the public good</i>
<i>Desechad los particu- lares.</i>	<i>Relinquish your pri- vate interests.</i>
<i>Pues vos fizo Dios pilares</i>	<i>Then shall God make you the pillars</i>
<i>De tan requisimos techos.</i>	<i>Of this splendid palace.</i>
<i>Estad firmes y dere- chos.</i>	<i>Stand always firm and upright.</i>

(An inscription on the entrance stairs to the Town Hall of Toledo.)

Our Inset Sheets.

THE new schools at Whitwick, Leicestershire, will accommodate 250 infants, and were designed by Mr. J. P. Cooper, of London, W. The building consists of a big schoolroom, three classrooms and a cloakroom, and is divided by a passage, with a lobby at each end, which runs through to the playground at the back. —The four houses on the Embankment at Cheyne Walk belong to a group in the space between Old Chelsea Church and Danvers Street. No. 72 and 73 is a composite house, and is constructed with sculptor's studio at back and mezzanine floor, and a painter's studio above. It has been sought to give a colour effect with grey stocks, rough cast in parts, and a high-pitch green slate roof. In No. 74 is an elaborate hammered coppered door. The internal arrangement of this house is also different from what is customary, as the whole of the ground floor is given up to a large room, the kitchen being on the second floor. Mr. C. R. Ashbee, M.A., of Chelsea, is the architect. —The pair of cottages by Mr. George W. Webb, F.R.I.B.A., of Reading, have recently been erected on "The Island," about two miles from Romsey, Hants, for the Rev. C. W. H. Kenrick. The walls are hollow to first floor, and the bricks used for facings are old deep-red ones selected from some old buildings which were pulled down. The upper parts of the walls are covered with ornamental tiles of a deep-red colour nailed to joints of brick-work. The roof is covered with dark-red tiles. Messrs. Roles and Son, builders, Romsey, have carried out the work. —The house at Wellington College, Berks, has recently been erected for Mr. H. W. Brougham, one of the masters at the College. The materials are dark-red facing bricks up to first floor and rough cast above. The roof is covered with dark-red tiles. The builder was Mr. J. B. Seward, of Wokingham, and the architect Mr. G. W. Webb, F.R.I.B.A., of Market Place Chambers, Reading, and Wokingham.

Over- crowding in Bombay.

It appears that the authorities at Bombay have a difficult problem to solve in the matter of housing their poor. A large portion of the population, many of whom never paid any house rent in their lives until they came to the city, consider that any rent at all is too much, and they live actually in the streets throughout the fair season. During the rains they will grudgingly pay one-thirtieth of their wage for the eighth part of a floor 10ft. square, and this custom has received no check from the authorities. As these people sleep by preference with door and shutters closed during the rains, the foulness of their unventilated rooms defies all description. Such tenants are not particular about their surroundings. They never clamour about paint and varnish, window glasses, or drains. As long as there is a door or a window from which to throw any and every kind of refuse they seem content, for they

have brought the cost of house rent down to something very near the irreducible minimum. This class furnishes a large proportion of the domestic servants. Living in an overcrowded city seems to have a degrading and demoralising influence in India, as elsewhere, and much of this degradation is plainly due to the complete irresponsibility of the Bombay house-proprietor, who up to the present time has enjoyed an immunity from control that it would be hard to find in any other part of the British dominions.

The Old Method.

IN the good old times, when an Indian city became absolutely rotten with saturated filth of every kind, when the wells were poisoned with the cesspools, and disregard of

TOWER OF ST. DIONYSIUS' CHURCH, BRADNINCH, DEVON. DRAWN BY JAMES M'LACHLAN.

the most elementary sanitation ran up the death-rate to awful percentages, it was the fashion to abandon the city, and build a new one at a sufficient distance to be out of reach of the influences that had wrought such havoc among the people. A new town was built, and the old ways of life were pursued as before, repeating former experiences in a way that, at least, may be called consistent. The time is approaching slowly but surely when Bombay must either cross the harbour or strike sternly at the "national customs" of filth, disorder, and greed that have brought the city to its present deplorable condition. From recent telegrams it appears that the

work of improvement and re-building has already begun. New erections are springing up everywhere, and it is stated that never before has there been such a boom in the building trade. Private enterprise is effecting the change, but the Bombay Improvement Trust have schemes in hand which will cost about four million pounds sterling. Within the next few years it is probable that about £7,000,000 will be spent in the re-modelling of Bombay.

St. Dionysius' Church, Devon. The drawing of the tower and porch of this building on this page is by Mr. James M'Lachlan, of Edinburgh, and is one of a set which gained the Pugin Studentship prize for 1900 given by the Royal Institute of British Architects. Other drawings by Mr. M'Lachlan have appeared in our issues for February 7th and April 25th last.

Wood- working Machines.

WE have already referred in previous issues to the excellent series of articles on "American Engineering Competition" now appearing in the columns of "The Times" newspaper. In the first part of the article on machine tools, which was printed on Tuesday in last week, the author says that the two most interesting mechanical features he saw at a large wood-working shop were the band saws for breaking down logs and a new fixed-knife planer. The usual method of cutting up timber in this country is by the gang saw, which may be described as a number of pit saws placed side by side in a frame and worked up and down by an engine. The band saw consists of a flexible, serrated steel strip, the two ends of which are brazed together to make a continuous band. This runs over two flat-rimmed wheels, or pulleys, mounted in a suitable frame. The speed is very high and the direction of motion is continuous, not reciprocating, as in the gang saw. For these reasons a very thin saw may be used, and naturally there is a narrow saw cut, so that less timber is wasted and much thinner boards can be produced. It is but fair to English engineering to say that a firm of manufacturers of wood-working machinery in London have also taken up the introduction of the band saw for heavy work.

Manual Dexterity and Brain Power.

THE author says that the great army of skilled mechanics in America "are considered a tower of industrial strength, but perhaps they may also prove a source of weakness; and here it may be pointed out that great manual dexterity by no means indicates a high state of civilisation, but perhaps rather the reverse. The ivory carvings of China, and even the flint implements of pre-historic man, are instances in point. Before planing machines, milling machines, and emery grinders were invented the mechanics who chipped surfaces with the chisel, and filed them smooth by hand, possessed a manual dexterity that seems to be fast disappearing. Rude as many of the early steam engines are to our eyes, it is doubtful whether they could be produced now with the appliances then in use. Any lad fresh from school can learn to attend a milling machine in a few hours, and will produce a surface that could hardly be excelled by a man with hand tools who had spent half a lifetime in acquiring manual dexterity.

What is Demanded.

"A GREAT many English artisans who go out to the United States find the first thing they have to do is to forget they are skilled mechanics. Some refuse to learn the lesson, and they either go to the wall or go home again. The majority, however, conform to the situation, and mould themselves to the new conditions in a manner they would never do in England. The man who has the sense to do this will generally rise, and then his wider knowledge stands him in good stead. His early training has been in shops where specialisation is not carried to the extent it

is in America. He is not a mere machine-minder, and so it often comes about that he is chosen as foreman, because his more comprehensive knowledge enables him to exercise jurisdiction over a wider field. On the other hand, I have found the majority of the most highly-skilled mechanics in America, such as are employed in the tool rooms, to be Americans native born, or at any rate educated in America. The reason for this it is difficult to give, but probably that superior education—to use the word in its widest sense—of the American workman enables him to think more closely, and to study how best to develop manual dexterity; for, after all, what we call manual dexterity is largely a matter of brain power."

An Old Roman Gateway.

FOR some time past excavations have been going on at Gelligaer, not far from Cardiff, on the site of a Roman camp,

under the auspices of the archaeological section of the Cardiff Naturalists' Society, of which Mr. G. E. Halliday, F.R.I.B.A., is the secretary. At the present time the whole of the efforts of the excavators is concentrated upon the middle of the south-western rampart. Inequalities in the surface of the soil pointed to the fact that there was a gateway here, and subsequent excavations have laid bare the foundations of a big double portal, through which ten Roman warriors might have marched abreast. It is a portal double the size of that which was laid bare on the north-western side, and one far larger than any that has yet been excavated in the west of England or Wales. The recently excavated gateway had two portals or passages, each of which was arched, whereas that which was unearthed last autumn on the north-west side of the camp had but one portal. At each end of the gate-way is a guard-room, about 8ft. 6in. by 10ft., the walls of which are between 2ft. and 3ft. thick. The excavations were carried down about 3ft. or 4ft., until the original ground level was reached. Work was continued then across the old entrance, and the long stone slab which formed the sill, and which projected 6in. above the roadway, was found, the grooves caused by the passing of the chariot wheels over the stone being clearly defined. There is every hope that many more discoveries will be made on the site of this old camp.

Technical Education in London.

FOUR institutions are now under the direct control of the Technical Education Board of the London County Council—the Central School of Arts and Crafts in

Regent Street, the School of Photo-engraving and Lithography in Bolt Court, the Camberwell School of Arts and Crafts in Peckham Road, and the Shoreditch Technical Institute in Pitfield Street, Hoxton. The last was opened by the Board last October in buildings formerly occupied by the Haberdashers' Schools. Extensive alterations have been made, new workshops erected, and a series of trade classes established, mainly for persons engaged in the furniture and cabinet trades. The organisation which the Council has established as the local authority for technical education under clause 7 of the Science and Art Directory has now been joined by fifty-three institutions, and the working of the clause has assisted the Board in coming into closer touch with the work of the various institutions. Steps have been taken during the past year for the co-ordination of the evening classes conducted by the Technical Education Board and the School Board for London, and certain proposals for carrying out this object have been adopted by both bodies. The establishment of the New University of London is likely to have an important bearing on the future work, especially as regards that carried on under the new faculties of engineering and economics. The Board has voted £2,500 a year towards the support of each of these faculties, and its total grants to university institutions now amount to £10,000 a year. The Council has voted the sum of £180,000 for the purposes of technical education during the coming year.

New Art Society.

AN art poster society is being formed and a committee has been selected, including Mr. Robert Sauber, Mr. Cecil Aldin, Mr. Tom Browne, and Mr. W. S. Rogers, with Mr. Austin Fryers as secretary, to arrange working details. One of the qualifications for membership of this society is that candidates should have published three posters at least. As poster designing has of late become a very widely-recognised form of professional work, and has acquired a standing among the arts that is certainly far from unimportant, such a society has many possibilities. Its exhibitions ought to be extremely interesting; and, if they are managed in the right spirit, they may well be expected to encourage the originality and enterprise of clever designers.

Charing Cross Hospital.

WORKS for the enlargement and improvement of Charing Cross Hospital have been commenced, the designs being those of Mr. A. Saxon Snell, F.R.I.B.A. When the building, the cost of which will exceed £80,000, is completed, it will join the Royal Westminster Ophthalmic Hospital in King William Street and Chandos Street. Most of the leases of the intervening property have fallen in, and the General Court is now treating for the surrender of the remainder. A new sanitary tower and a new kitchen are now in course of erection, and a building of considerable interest is being demolished. This is the old Charing Cross Theatre, in King William Street, which was built about seventy years ago. From 1848 to 1856 it was used as a chapel and residence by the Fathers of the London Oratory of Saint Philip Neri, before their removal to the Brompton Oratory. Here, too, in 1850, Cardinal Newman delivered his celebrated lectures on "Anglican Difficulties." Afterwards it became the Folly Theatre, under the management of Mr. John S. Clarke. In November, 1880, Mr. J. L. Toole took over the management of the theatre, which he reconstructed and renamed, calling it Toole's Theatre. Of the sum required to carry out the hospital structural improvement the Council have in hand or promised £25,000. The architectural features of the new wing will harmonise generally with the creation of Decimus Burton, which was erected in 1831.

Italian Restorations.

CONTINUING the discussion about the restoration of the church of Santa Maria della Spina at Pisa (see page 330 of last week's issue, and page 234 of our issue for May 2nd), Mr. Charles L. Eastlake, in the "Times" newspaper for June 2nd, says: "I have before me a carefully measured elevation of the facade and detailed sketches of this church, which I made in 1858, and I can only say that the attention with which the profiles of the mouldings and character of the carved work have been preserved, and where necessary reproduced, in the restoration, is highly commendable. Mr. Ruskin's name is dear to all lovers of art, but it is generally admitted that his enthusiasm often tempted him into hyperbole, and that in accentuating his theories he sometimes sacrificed accuracy to rhetoric. His description—quoted by Mr. Cockerell—of the destruction of a cross by a workman during the restoration of Santa Maria della Spina would be pathetic if we were assured that the cross in question formed part of the original design. But I happen to have a well-preserved photograph of the building, taken many years before Mr. Ruskin wrote his declamation, and neither in the photograph nor in my notes can I find any trace of such a feature. If, therefore, a stone cross were really destroyed on the occasion referred to, is it not probable that it was a bit of late and temporary *rifacimento*, properly discarded when the work of restoration was undertaken by competent hands. In my 'History of the Gothic Revival' and elsewhere I have protested as strongly as anyone against the practice of injudicious 'restoration.' But when, as in the present case, an interesting old struc-

ture is preserved from certain ruin (for the water of the Arno was sapping the foundations of the church) by necessary and, as I think, careful repair, it seems to me unreasonable to complain."

Mr. Cockerell's Reply.

MR. COCKERELL replies as follows: "I can only say that the church of Santa Maria della Spina at Pisa has all the appearance of a new building, and that a well-known architect told me the other day that the exterior was on this account so painful to him that he had not had the heart to go inside. The accuracy of the renewed mouldings is not questioned, any more than those of many another building of which the beauty has passed into nothingness at the hands of the restorer. In such cases the more skilful the forgery the more lamentable is the result, as the difficulty of disentangling the authentic portions of the building is increased. In a memorable passage of the 'Seven Lamps of Architecture,' written more than fifty years ago, Ruskin asserted this principle once for all. In a less known essay of the same period (1849) he says: 'Care and observance, more mischievous in their misdirection than indifference or scorn, have in many places given the mediæval relics the aspect and associations of a kind of cabinet preservation, instead of that air of majestic independence, or patient and stern endurance, with which they frowned down the insult of the regardless crowd. Nominal restoration has done tenfold worse, and has hopelessly destroyed what time, and storm, and anarchy, and impiety had spared.' These words seem peculiarly applicable to the church of Santa Maria della Spina, as it now confronts us on the quay."

Two Old Churches.

AMONG the exhibits at this year's Academy are some drawings of two famous Lincolnshire churches—St. Edith's, Anwick, and South John the Baptist's, South Witham. The first named is well known to archaeologists and architects as a fine example of the Decorated style. The tower and spire are regarded as especially beautiful, and have been much copied with more or less success. Though mainly of the Decorated period, the north side of the nave has Early English features. Marks on the interior of the tower show that the church has had at various times three roofs at different heights. The chancel has been much mutilated from time to time, and a great deal of carved work belonging to it has been found buried. It is now being restored to its original state and length. The church at Witham is principally noteworthy for the varied character of its architecture—Norman, Early English, Decorated, and Perpendicular being all represented. Another noticeable feature is the tapering of the north and south aisles from west to east. Here, too, the chancel had been badly treated, and was practically ruined, so that it has to be rebuilt. There are some fine windows in the transepts.

Brief, but to the Point.

THE zeal of the descriptive writers about the French Exhibition is showing signs of flagging, but before it ceases altogether it may be well to draw attention to the following critique on the different art styles, written by a foreigner who has certainly the rare quality of crispness: "The fresh and childish totterings of Norway and Sweden, the solemn and processional tread of Germany, the hot-headed and bold-handed dash of Russia, the Gothic modernity of Greece and Italy, and the intensely European civilisation of America positively pluck one by the sleeve and seem to beg for nicknames. The Croatia and Slavonian rooms are the most remarkable for steady and noble epic style—fine subjects and full academic study. Denmark has some stirring touches of genius, and Spain the freest handling of the brush and of dramatic opportunity. But, on the whole, the English rooms have the best groomed canvases, well-bred, well-fed, and sleek-coated."

Babylonian Treasures. THE new Babylonian and Assyrian Room at the British Museum contains, if not the largest, certainly the most representative collection to be found in any museum in the world. In one case are a number of circular documents giving the cadastral surveys of estates on which the Imperial revenue was based. These surveys were necessary owing to the boundaries of land being frequently disturbed by the inundations of the Euphrates. The wonder about the tablets, which date from 2,300 B.C., is their astonishing preservation, many of them looking quite new. In the wall cases are an excellent collection of inscribed bricks belonging to the later Nebuchadnezzar's (II.) reign. There is also a brick bearing the names and titles of Nabonidus (the father of Belshazzar); and on this there is a distinct impression of a human foot, manifestly made on it when the clay was moist. Many of these bricks have still adhering to them the bitumen with which they were cemented. There are also a number of bricks which bear the names and titles of the Elamite kings who reigned at Shushan. This newly-opened Babylonian Room has not only been carefully arranged but is also accompanied by an excellent catalogue and guide, a work reflecting great credit on Dr. Budge, the curator of the department, and his assistant, Mr. King.

On Ruskin. MR. R. WARWICK BOND, M.A., lectured last Tuesday week at the Royal Institution on "Ruskin, the Servant of Art." He began with some general observations on Art and the function of the critic, describing the latter as being to announce to the world the practical principles gathered from artists, and to artists the limitations necessary to their usefulness and preservation, thus correcting the suicidal usurpation of technique. The critic's function was the result of modern estrangement between Art and general life. Ruskin's philosophy, his insistence on the didactic and useful function of Art, and its relation to religion, was next dealt with by the lecturer. Then, after a reference to Ruskin's claim for the necessity of, first, faculty, and, secondly, hard work, his dislike for conventionality, and demand for truth of representation, Mr. Bond spoke of his criticism of early Italian painters and of Turner. Though in Turner he was inclined to magnify his office as patron and discoverer, still Ruskin was no wholesale admirer and was ready to recognise faults in the works of Turner. A brief reference was then made to Ruskin's claims for Gothic over Greek architecture, his wilful preference for Venetian over northern Gothic, and his disregard for modern conditions governing architecture. Ruskin's unreliability was spoken of. Coming to Ruskin's literary faculty, the lecturer attributed it to the effect of hearing his father read aloud both prose and poetry and to his early habit of recording his impressions in a diary. It was not that he wrote prose and poetry that was remarkable so much as that he so early and so decisively abandoned the writing of verse. Ruskin's prose, if it did not exhibit what Ruskin himself had noted as the "Pathetic Fallacy," contained in a still higher degree the recognition of God in Nature, and so carried forward the naturalistic movement of Wordsworth, Shelley, and others.

At St. Andrew's Church, Letheringsett, Norfolk, an elaborately-carved alabaster reredos has been erected.

London's New Street: The Work Begun.—The pulling down of the Holywell Street block as part of the Strand widening has diverted public attention from the beginnings of the greater scheme to carry a new thoroughfare through to Holborn. The work of carving a way through the mass of brickwork behind the north side of the Strand has already commenced, the first demolition having taken place in the neighbourhood of Clare Market. It is calculated that it will be quite three years before all the necessary clearances are effected.

Surveying and Sanitary Notes.

Mr. W. Champion, borough surveyor of Southmolton, has been appointed surveyor and sanitary inspector for Northam at a salary of £120 per year.

New Pleasure Grounds at Bourne-mouth have been opened. They have been presented by Mr. Robert B. C. Scarlett, and cover nearly four acres on the cliff front.

Gift of a Park.—Mr. John Christie, of Gallangad, has given a piece of ground of fourteen acres extent to be laid out as a public park for the residents in the Vale of Leven district, Dumbartonshire. It is at present known as Notman's Park, and between £6,000 and £8,000 will be needed to effect the necessary alterations.

New Recreation Ground for Worthing.—The Worthing Town Council have agreed to purchase about eight acres of land at £650 an acre for the purpose of a recreation ground in the north-west part of the town. Including the cost of fencing and the levelling and laying-out of the ground, this will mean a capital outlay of about £6,600.

A Wise Direction.—The city engineer of Liverpool (Mr. J. A. Brodie) has been granted municipal authority to prepare a list of streets which bear duplicate names, together with suggestions for renaming these. It is suggested that Mr. Brodie might go further and persuade the Health Committee to take away the double designation of such short thoroughfares as Elliot Street, and Parker Street, Hardman Street, and Leese Street, Liverpool.

Surveyors' Benevolent Fund.—The annual report of the Surveyors' Institution states that £6,791 3s. have now been received and promised towards initiating a benevolent fund in connection with the institution. Mr. Robert Vigers presented £500 as the nucleus. The Committee, after the most careful consideration, have decided to make an application to the Board of Trade for the incorporation of the fund under the Companies' Acts, with the style and title of the Incorporated Benevolent Fund of the Surveyors' Institution.

New Public Garden at Blackfriars.—The old and somewhat neglected churchyard of Christchurch, Blackfriars, which has been transformed into a charming public garden by the Metropolitan Public Gardens Association, is to be formally opened to-day. The ground has been laid out by the Association's lady gardeners, and will be maintained at the cost of the St. Saviour's District Board of Works. In addition to the Collingwood Street and Bennett Street entrances to the transformed ground, there will be a new one from the Blackfriars Road.

Monmouthshire Main Drainage.—At a recent meeting of the Newport and District Association of Civil Engineers, Architects and Surveyors, Mr. William Tanner, Monmouthshire County Surveyor, read a paper on a main drainage scheme for the county, in the course of which he said that the length of sewer from the tops of the Valleys to the sea wall was 32 miles 338 yds., the estimated cost being £149,421. In addition, there was the outfall, which was intended to be 1,407 yds. in length, carried to low-water mark, and estimated at £12,000; making a total of £161,421.

Sewage Works: Sunderland's Little Joke.—Some comical scenes have been witnessed at Sunderland. The neighbouring township of Fulwell having a legal right to connect their drainage system with that of Sunderland, attempted to do so at a point which would have necessitated the borough enlarging their sewer. Accordingly as fast as the navvies engaged by Fulwell threw up the earth from the trench gangs of corporation men shovelled it back again. Neither side would give way until Sunderland's engineer prepared to flood the trench, when the Fulwell workmen capitulated. The township is now asking for terms.

Rattray's new Sewage Works.—A sewage disposal works on the septic tank system patented by Mr. D. Cameron, city surveyor of Exeter, has been opened at Rattray, Blairgowrie. The advantages claimed for this system are non-production of sludge, a tank effluent in the best condition for either irrigation or filtration, a filtered effluent of great purity, a process free from nuisance, absolute reliability in working, and cheapness. The Rattray works are designed to serve a population of 2,000, the maximum flow of sewage provided for being 100,000 gallons per day. The cost of the tanks was about £350. Mr. Symon, C.E., of Arbroath, superintended the execution of the work.

Dust and Microbes.—A correspondent writes to the "City Press" as follows:—"It is not commonly known that in a London street the number of dust particles in a wineglassful of 'clean breathing air' is about 30,000,000, whereas at the level of the second floor the number is three times less, and the number of microbes thirty times less, facts of which advantage is taken in modern methods of ventilation. Nevertheless, as only twenty out of the 600 known bacteria are hostile to man, and of these only a few have their habitat in the air, we must not attach any exaggerated importance to their presence. What is important is dust. We spend £2,000,000 per annum in London alone to expel this plague (allowing one-tenth of a housemaid's time to every ten of the population). But are we right in doing this? Should we not rather imitate the jayvee who endeavours 'to kape the could out, before iver it gits in at all?' The example is easy to follow."

New Park and Promenade for Widnes.—The Victoria Park and Recreation Ground, Appleton, and the Victoria Promenade, West Bank, which form at Widnes a permanent memorial of the Queen's Diamond Jubilee, have been opened to the public. The park is 34½ acres in extent and was purchased for £4,500; it was laid out according to the designs of Mr. J. S. Sinclair, the borough surveyor. A band-stand has been erected, but the planting of shrubberies and trees is not yet completed. Altogether, the park has cost £7,349. The Victoria Promenade is an extension of the existing promenade on the banks of the Mersey. The new portion is 630 ft. long, and the width at the widest place, from Terrace Road to high-water mark, is 130 ft. The land has been laid out in terraces, and a strong river wall has been constructed. This work has also been done from the designs of Mr. Sinclair, the contractor being Mr. John Taylor. The cost of the land was £1,500, and the construction of the promenade entailed a further cost of £4,130, making a total of £5,630. Thus, on both undertakings, £12,979 have been spent.

Hospital Extension in Liverpool.—The Hospitals Committee of the Corporation propose to erect additional pavilions at Fazakerley, and to carry out a new scheme of drainage, at a cost not to exceed £8,510.

Architectural Association of Ireland.—At the last meeting of the session, held on May 31st at Dublin, the president, Mr. George Sheridan, in the chair, a resolution was passed expressing satisfaction at the honour of knighthood conferred on the president of the Royal Institute of Architects of Ireland, Sir Thomas Drew, who is also a member of the above association. After Mr. Sheridan had read a valedictory address, Mr. Kaye Parry, F.R.I.B.A., took the chair. The following elections were then made: President, Mr. F. Batchelor, F.R.I.B.A.; vice-presidents, Messrs. M. J. Tighe and C. H. Ashworth; committee, Messrs. H. Allberry, G. Sheridan, R. C. Orpen, J. Holloway, R. M. Butler, T. E. Hudman, H. J. Pentland, T. Coleman, L. O'Callaghan; librarian, Mr. J. Geoghegan; hon. treasurer, Mr. J. H. Webb; hon. secretaries, Messrs. F. G. Hicks and E. W. Bradbury; hon. auditors, Messrs. W. Beckett and M. J. Buckley. A vote of thanks was passed to Mr. H. Allberry, who, under the by-laws, had to retire at the end of two years from his position as hon. secretary.

Professional Practice.

Birmingham.—A new theatre has been erected on a site at the corner of Nechells Place and Sattley Road, at a cost of about £14,000, from designs by Mr. T. Guest, architect. The main entrance to the building has been made at the junction of the two roads, and the central portion is built in Kingswinford red facing bricks, relieved with buff terra-cotta. Over the dress circle entrance there is a large window, which forms the main feature of the elevation. Around this sweeps a massive moulded arch, and radiating from it are keystones extending to the turrets on each side and the main cornice above. In the centre the building is surmounted by a heavy gable in terra-cotta bearing the name of the theatre—"The Carlton Theatre"—in red terra-cotta; while at each side there is an octagonal turret in buff terra-cotta, with ogee-shaped lead roof. The pit is about 60ft. square and provides seating accommodation for between 600 and 700 persons. Four gangways will add materially to the convenience of the audience, and not more than ten or a dozen persons are accommodated on each bench. The orchestral stalls seat about 100 persons. The exits are good and well arranged, there being six doors, all fitted with panic bolts. The stage is 60ft. by 38ft. Facing Nechells Place are four retail lock-up shops, and in the rear of these are the refreshment rooms of the pit and the artistes' dressing-rooms. Each of the latter has an external window, while the stage is adequately provided with exit accommodation. All communication to the stage from the auditorium is cut off by means of an asbestos fireproof curtain, and the doors between stage and auditorium are of armoured oak. On the first floor a dress circle has been constructed to accommodate 350 persons, and two distinct staircases are provided for purposes of exit. The gallery gives seating accommodation for 700 persons, and the first two rows form an amphitheatre. There are six private boxes, two of them being on the pit level. On the Nechells Place frontage no erection has been made over the shops, and these for the time being will form a concrete flat, which will, in all probability, be converted into a sort of winter garden. Fire is provided against by numerous hydrants and corridor pumps, and granite fireproof plaster is used on the walls and ceilings. This is the first building in Birmingham in which this plaster has been used. The theatre will be lighted by electricity, but gas will also be laid on. Unlike many theatres, the stage will be heated on the low-pressure system, and the rush of cool air to the auditorium on the raising of the curtain will thus be obviated. Mr. T. Johnson was the building contractor.

Darlington.—A few miles south of Darlington lies the little village of Croft, with its quaint old church. This building has just been restored under the superintendence of Mr. W. S. Hicks, architect, of Newcastle. Not infrequently "restoration" is a word of evil omen, but in the present case it is stated that care has been taken not to interfere with any antiquarian or picturesque feature. For the present the work has been confined to the chancel and the extreme west end of the church. The south aisle has been restored by Sir William Chaytor, Bart. Lady Chaytor has also taken a warm interest in this work, while Mr. W. H. Wilson-Todd, M.P., of Halmaby, has undertaken the restoration of the north aisle. The chancel is now handsomely panelled in oak, slightly darkened so as to harmonise with the old woodwork. An oak reredos, designed by Mr. Hicks, and carved by Mr. Hedley, of Newcastle, has been erected by the Chaytor family and a few friends in memory of the late Sir William Chaytor. The side panelling is the gift of the Dowager Duchess of Northumberland. The floor of the sanctuary is composed of alternate squares of Frosterley marble and Barton limestone. The oak roof was thoroughly restored last year by the Rector, who, with his family, has now provided the

chancel stalls. At the west end four rows of excellent oak seats have taken the place of a few temporary benches; the font has been restored to its ancient position; and the heating apparatus and gas supply have been improved. Mr. H. Harwood, of Mansfield, was the contractor.

Dublin.—An addition is being made to the Dublin University Union Buildings

from the designs of Sir Thomas Drew, F.R.I.B.A., R.H.A. Operations were begun in 1899 and now the third floor has been reached. This block of buildings will add much to the appearance of the College in the centre and is the Graduates' Memorial, erected by subscription; at the sides are two blocks of buildings containing chambers for students erected by the Board. The buildings will harmonise with the rest of the College, being built of granite and

Portland stone, which is at first white but becomes grey with age, and they will represent a free treatment of a classical design. On the ground floor there will be a large writing room and library (two storeys); on the first floor, reading room and galleries to library; on the second floor, four rooms for the use of the voluntary societies; on the mezzanine floors, three rooms for lavatories, cap and gown rooms, &c. The coal stores, heating apparatus, &c., will be situated in the basement. The entrance hall will be 24ft. by 20ft. A theatre or debating room, about 44ft. square, will be situated at the rear of the building, to which there will be access from the other principal rooms. The students' bedrooms will be situated on the north side of a corridor, while the sitting rooms will be on the south side. The sets of rooms will be single, and will afford accommodation for about forty students. Messrs. Sharp and Emery, of Great Brunswick Street, Dublin, are the contractors. It is probable that the buildings will be completed in a year.

Glasgow.—The Nurses' Home at Gartloch Asylum, Glasgow, the foundation-stone of which was laid in September, 1898, has recently been completed and opened. The new Home is an admirable example of its class, and its internal arrangements are such as to provide every possible comfort and convenience. The building is separated from the principal asylum structure, and is situated to the south of it, overlooking the loch and its wooded surroundings. Accommodation is provided for about fifty nurses, and there is, in addition, a section for servants. The night nurses, for whom proper rest by day is essential, are lodged in a separate part of the Home, reached by a special staircase. There are six parlours, four of which are for day nurses. Each floor has ample bath and lavatory arrangements, and a room is provided in which nurses may receive their friends. The principal kitchen is placed on the ground floor, and small lifts run to the sculleries on the upper floors. The basement contains box and bicycle rooms and the heating apparatus. The building throughout is handsomely furnished, and the well-lighted rooms and corridors have a bright and cheerful appearance. Messrs. Thomson and Sandilands, of Glasgow, were the architects.

Leeds.—The back-to-back houses illustrated on the preceding page were erected in Leeds a short time ago from designs by Mr. Charles Fowler, C.E., architect and land surveyor, of Leeds. They have a frontage of 18ft. 6in., are 15ft. in depth from back to front, and have a forecourt 15ft. wide abutting upon a street 39ft. wide. They are built with double-pressed red bricks; there is a bath in each scullery with a lid to fall down and form a table; hot and cold water is laid on to the baths and sinks in the sculleries and washing cellars; the hearths in the living rooms are laid with black and red tiles 6in. square; the bay windows are of wood; and the buildings are roofed with Welsh slates. The cost, including land, was a little more than £200 per house.

New Church for Mexborough, Rotherham.—The Bishop of Beverley visited Mexborough last week in connection with the stone-laying of a new church at the populous west end of the town. The building is to cost £2,500, and there is ample area for contemplated enlargement. The architect is Mr. J. N. Cowper, of Westminster, and the contractor, Mr. G. H. Smith, of Mexborough.

The Royal Institute of British Architects held a business meeting last Monday evening, when the following gentlemen were elected members: As Fellows, Messrs. Ibrahim Shaik David Ahmadi (Bombay), John Bain (Newport, Mon.), Sydney Francis Bartlett (London), Henry Budgen (Cardiff), Alfred Arthur Cox (Montreal), Thomas Dinwiddie (London), Ernest Flint (London), Frank Loughborough Pearson (London), and Nathan Glossop Pennington (London); as Hon. Associates, Messrs. George James Frampton, A.R.A. (London) and Frank Newton Jackson (London).

Engineering Notes.

The Amalgamated Society of Engineers have now a membership of 85,000; the capital is put at £328,000.

Proposed Tramways for Wakefield.—A London syndicate proposes to construct tramways in Wakefield and some of its suburbs. The estimated cost of the scheme is £82,181.

Heating by Hot Water.—New premises and a concert hall, for the Burton-on-Trent Co-operative Society are now being fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool.

Electricity at Simla.—Electricity is making its way in the summer capital of the Government of India. Four schemes have been proposed for the lighting of Simla by electricity; all propose to employ water power and turbines for generating the necessary current.

Proposed Trams to Piccadilly.—The London County Council propose to construct tramways from the present terminus in Theobald's Road to Piccadilly Circus. The Vestry of St. James, Westminster, object; but they suggest that the tram lines should stop at Cambridge Circus.

The new Workhouse Infirmary, Doncaster, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves, some of them double fronted and some single fronted, with descending smoke flues, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Rapid Artesian Well-Boring.—A 200ft. deep artesian bored tube well, 13½in. internal diameter, has just been completed at Dunstable for the Gas and Water Company. The depth of 200ft. was reached in just over three weeks' time. The engineers are Messrs. C. Isler and Co., of Southwark.

Electric Lighting Scheme for Rhyl.—The Local Government Board have approved of the scheme for lighting Rhyl with electricity. The scheme will entail an expenditure in the first instance of £19,000, and will be worked in conjunction with a refuse destructor and a new electric tramway along the sea front.

Railway Improvements at Bridlington.—It is stated in Bridlington that the North-Eastern Railway Company are likely, before long, to make extensive alterations at Bridlington Railway Station, including the erection of a bridge over the line on Quay Road, and that the cost of the proposed alterations will be close upon £70,000.

Clegg Street Station, Oldham, is being enlarged. Messrs. T. and W. Meadows, of Stockport, are the contractors. The work includes a new booking hall and office, from which two staircases lead down to the platforms, whilst great alterations are being made on the platform levels. New refreshment and waiting rooms and other station buildings are being built, and an additional length of platform is to be added.

Blackburn Tramways.—The municipalisation of the tramways in Blackburn has resulted for the first year in a loss of £4,500, notwithstanding an increase in the number of passengers and the substitution of electric for steam traction on half the system. Reduction of fares, increase of employees wages, the price of coal, and repairs are responsible for the deficiency. The Darwen section, worked by steam, shows a substantial profit.

New North-Eastern Station at Hull.—The new locomotive sheds constructed for the North-Eastern Railway Company on the Argyle estate at Hull have just been completed. This brings within measurable distance the day when a commencement will be made with the reconstruction of the Company's Paragon Station in the city. The main front of the new station will, it is stated, be in Brook Street, in a line with the existing hotel. For this improvement the Company have for years past been purchasing large areas. Collier Street, on the north side of the station, will

almost cease to exist, and other alterations are contemplated by the municipal authorities which will change the whole aspect of this quarter of the city.

Electric Traction in Leeds.—For a considerable time electric cars have been run on the Kirkstall, Headingley, Chapelton, and Roundhay sections of the Leeds tramways, and have proved a great convenience to the public and a source of largely increased revenue to the Corporation. The system is being gradually extended to other districts in the city, and electric cars have now commenced running on the Beckett Street route.

New Gas Works in Glasgow.—Messrs. Robert M'Alpine and Sons, railway contractors, of Glasgow, have obtained, at the sum of £171,765 13s. 4d., the contract for excavation, brick building, and other work in connection with the gas works about to be erected by the Glasgow Corporation at Proven, in the east end of the city. At present it is intended to proceed with half only of the work ultimately contemplated—namely, with two gas-holders (each capable of storing 8,500,000ft. of gas) with their accessories. The contract given out is to be completed in two years, and thereafter the erection of the gasholder will be begun. As that will take up another eighteen months, four years will elapse before the works can be in operation.

Electricity on the Underground.—On the invitation of Messrs. Sir J. Wolfe Barry and Co., about 100 members of the Institution of Junior Engineers on Saturday inspected the electric train which has been running experimentally for the past three weeks between Earl's Court and High Street, Kensington. Subsequently the party visited the generating station, where Mr. Franklin, Sir J. Wolfe Barry's representative, explained the plant and described its working. One or two minor alterations have been made in the train since it started running. One is the shifting from the guard's compartment into the "engine-room" of the air-pumps which supplied compressed air for the Westinghouse vacuum brake and the whistle. In this way the noise and vibration caused in the end coaches by the constant action of the machines have been greatly reduced. The train has worked very satisfactorily and without interference with the ordinary traffic. It is still being run by the engineers, Sir J. Wolfe Barry and Co., and will not be taken over by the railway company till October.

New Bridge at Bristol.—Bristol had many ancient bridges, but most of the important structures which to-day are arteries for traffic have come into existence since the Cut and the Floating Harbour were formed. Noteworthy among them is the Suspension Bridge, famous among the bridges of the world. The latest addition is a swing bridge at Vauxhall. Its total length, including south abutment, swing portion, and fixed span, is about 270ft., and the width is 10ft. 8in. inside flanges of main girders. The swinging portion of the bridge is built of steel, weighs 150 tons, and is 158ft. in length. It is carried on a pier founded on concrete below the bed of the river, and is protected when open by timber dolphins up and down stream. Between the swinging portion of the bridge and Cumberland Road is a fixed girder span over the towing path and the new railway, from which a staircase communicates with the towing path, and another staircase and an easy incline lead to Cumberland Road. The foundations, masonry work, and timber dolphins were built by Messrs. Durnford and Son, the steelwork throughout was constructed by Messrs. J. Lysaght, Limited, and the opening and closing machinery has been made and fixed by Messrs. Sir W. Armstrong, Whitworth and Co.

New Branch Police Station at Derby.—Subject to the approval of the Council, the Watch Committee of the Derby Corporation have agreed to purchase 2,780 sq. yds. of land on the Dale Road Estate, at a cost of £1,369 9s., in order to erect a branch police station in that part of the town.

THE RAALZAAL, PRETORIA.

THE BUILDINGS OF PRETORIA.

PROMPTITUDE is regarded as a prime essential nowadays. When a noted person dies now we expect to find a long, perhaps an illustrated, notice of his life's work in the next morning's paper; and we find it. It is therefore not at all surprising to read particulars of the buildings of Pretoria the day after the news arrived of the fall of that city. The "Daily Graphic" says:—Though founded in 1855, Pretoria, as it stands to-day, is practically a creation of the same era as the Witwatersrand, the gold found there by the Uitlanders since 1885 having afforded the means for the ambitious architecture of the last ten years. In 1889 the Boer Parliament House was a little thatched building, little better than an English barn. Since then it has been replaced at a cost of £200,000 by a solid and massive edifice of some grandeur, unquestionably one of the finest of such buildings in South Africa. (We give an illustration of this building on this page.) Within, there are very handsome galleried chambers for the Upper Volksraad and the Second Raad. In the same block of buildings are the Government offices of all kinds. The Raadzaal, or Parliament House, fronts upon Church Square, a large bare space, on which also stand the new Law Courts, and the centre of which is occupied by the Dutch Reformed Church, representing the most numerous, but not, in President Kruger's time, the most powerful of the Transvaal sects. The object of the square or open ground around the large church, be it noted, was neither ornament nor hygiene, but rather the reverse; it is intended as an "out-span," or place whereon may be unharnessed the dirty and often insanitary ox-drawn waggons of the country people, drawn thither at fixed intervals for that curious compound of religion and sociality, "Nachtmaal." Near the lower corner of the square is the hospitable Pretoria Club, the centre of light and leading—mainly Uitlander—in Pretoria. The public buildings are the post-office, the new market, the public library, museum, and hospital; and there are one or two good-sized hotels which, as is common in South Africa, are to a great extent used as boarding-houses. The eccles-

iaistical buildings include, besides St. Mary's Church already mentioned, St. Alban's Church (the so-called English Cathedral), a Roman Catholic church, school, and convent; a fine Jewish synagogue, a Wesleyan church, Baptist Church, and others; and not least, the Doppe church, where President Kruger himself has not infrequently occupied the pulpit.

BRISTOL & GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.

THE spring meeting of this society was held on Thursday last. The old House at Toddington was first visited: the glass there is of three kinds—Swiss, German and English. The Swiss glass, which of its class is said to form one of the most important collections in Europe, belongs to the period of the thirteen cantons—1481 to 1798—during the chief part of which Switzerland was still formally dependent upon the Empire; hence the frequent appearance of the Imperial insignia. It was manufactured chiefly at Basle, Zurich, Berne, and Lucerne, and came from churches, and private and municipal buildings. The church of St. Leonard, Toddington, has a nave with chancel and two aisles, and a tower on the south side of the nave; the whole of debased style except the tower, which is Decorated. The nave has been recently embellished by the insertion of some modern painted windows. The chancel has windows which may be called Perpendicular, and has on the north a sepulchral chapel, closed. In the east window are pieces of ancient stained glass. The tower is plain, embattled and without buttresses, divided by one string. The belfry windows are of two lights, Late Decorated; there is also a two-light window in the lower part. The tower arch of the nave is pointed, springing from octagonal shafts.

The party next went on to Hayles Abbey. It was founded by Richard, Earl of Cornwall, in 1246. Twenty-five years afterwards fire consumed a large portion of the monastic pile, and Earl Richard, then king of the Romans, devoted 8,000 marks to its restoration. Again, in the fifteenth century, the monastery fell a prey to an extensive conflagration, and a

restoration became necessary, which transformed the cloisters from Early English to Perpendicular. In 1539 the abbey was surrendered to the commissioners of Henry the Eighth, and all but the abbot's house, standing on the west side of the cloisters, and the kitchen, butteries and larders, on the south-west, were condemned as useless. For the third time there came a fire, and cloisters and chapter house were burnt. For 300 years Hayles Abbey has been treated as a quarry, and its glory has departed. Much, however, remains that is full of interest for students of history and architecture, and the Council of the Bristol and Gloucestershire Archæological Society have obtained permission to excavate the site of the abbey and to protect the remaining cloister arches from collapse. The quaint church of Hayles consists of nave and chancel, both small. The adjoining meadow contains the earthworks of Ralph's Castle, and part of the Norman church itself remains. The shafts and caps of the chancel arch and two pilasters which support the south wall of the chancel are a hundred years older than the oldest part of Hayles Abbey. It is impossible to tell how much more remains, as a thick coat of plaster on the walls, outside and inside, forms a barrier to research. There is a campanile of two bells at the west end, and the remains of a sanctus bell-turret over the chancel arch.

Didbrook was the next place visited by the party. The manor of Didbrook formed part of the original grant by Richard, Earl of Cornwall, to the Cistercian monks of Hayles for the endowment of that abbey. The church of St. George was rebuilt by William Whitchurch, Abbot of Hayles and sometime vicar of Didbrook. The tower is constructed within the nave, at the west end, and its north, east and south sides rest on arches with graceful piers and capitals. Battlements, pinnacles, and vigorous gargoyles render the arrangement of the tower stately and unusual. The east window contains fragments of ancient glass and part of an inscription.

The next place at which a halt was made was Stanton. The two manors of Stanton and Snowhill were given to the abbey of Winchcombe by Kenulph, king of the Mercians. The church of St. Michael consists of a nave with

south porch, north and south aisles, and north and south transeptal chapels, chancel, and western tower. In the village street are the base and shaft of a characteristic fifteenth-century cross.

Stanway was the next and last place on the route. The Manor of Stanway was given to Tewkesbury Abbey in 715. In 1066 there was a monastic cell here, which afterwards devolved into an abbot's country seat. The nave and chancel of the church of St. Peter were originally Norman, and still retain much of their original walling. Rudge spoke of a Saxon pillar in the church in his time (the commencement of the nineteenth century) but said that the church had been completely modernised. Stanway House is a splendid example of domestic architecture, and there is a gateway of fine design leading from the churchyard. In the house itself the charm is due to dignity, fine outline, and good proportion, the chief feature being the hall with its large bay window, divided by mullions and transoms into sixty divisions.

Builders' Notes.

Society of Estate Clerks of Works.—On and after June 24th, 1900, all communications for the secretary of this society are to be addressed to Mr. T. Potter, 5, Outram Road, Croydon.

New Shops for Leeds Estates Co.—The tender of Messrs. Armitage and Hodgson, of Leeds, has been accepted by the Leeds Estates Company for the erection of three blocks of shops on the north and south sides of Cheap-side, and the south side of New Bond Street.

The Southampton Disaster.—At an inquest held at Southampton on Thursday last on Charles Pattison, who died from injuries sustained through the recent collapse of a structure at Southampton Dock, it was shown that the ground on which the structure stood had sunk 4ft. 3in. at one end, and thus caused the accident (as suggested in the letter which we printed on page 329 of last week's issue). A verdict of "Accidental Death" was returned.

A Scottish Compensation Case.—In Kirkcaldy Sheriff Court on Thursday last Sheriff Gillespie decided a compensation claim under the Workmen's Compensation Act at the instance of A. Wishart, carter, Kirkcaldy, against Messrs. A. Fraser and Sons, contractors, and A. Fraser, jun., brick manufacturer and contractor, Pathhead, Kirkcaldy. Wishart went to the brickworks with two horses and carts to carry bricks to a factory in course of erection, and while crossing an unfenced bridge leading to the brickworks he, together with one of the horses and carts, fell a distance of 29ft. to a rocky foundation beneath. The defence was that plaintiff was not employed about the brickworks, or any part of it, and was not entitled to compensation from the defendants. The Sheriff found that, in the circumstances, neither of the defendants was liable to pay compensation, and he accordingly dismissed the action, discerning against the plaintiff for £3 of modified expenses.

Structures Below Ground under the L.B.A.—Judgment was recently given at the Thames Police Court in a summons taken out by Mr. Arthur Crow, district surveyor, against the Whitechapel Board of Works for executing certain works in Great Prescott Street without serving a notice respecting them, in accordance with the London Building Act. The Board had been engaged laying electric lighting cables and inspection chambers under the footway. The chambers were built of brick, with iron joists for the roof, for the purpose of moving the cable in case of accident, and without removing the paving, and no notice had been given of these works.—Mr. Dickinson held that the inspection chambers were "buildings, or structures, or works," within the meaning of section 145 of the Act. He could see no reason why the terms of the Act should not apply to buildings below as well as on the surface of the ground. He therefore imposed the nominal penalty of 1s. and £10 10s. costs.

BACON'S ESSAY ON BUILDING.

ONE could hardly say that the "Essays" of the great Sir Francis Bacon (1561-1626) had such a wide circle of readers now as some yellow-backed novels or half-penny newspapers; in fact, it might fairly be stated that Bacon has become a memory. As this is so, and as, nevertheless, we feel sure many of our readers will be interested in his essay on "Building" (which, it may be mentioned, has been suggested as a good scheme for architectural students to carry out), we give a reproduction of it below:—

Houses are built to live in, and not to look on; therefore let use be preferred before uniformity, except where both may be had. Leave the goodly fabrics of houses, for beauty only, to the enchanted palaces of the poets; who build them with small cost. He that builds a fair house upon an ill seat committeth himself to prison. Neither do I reckon it an ill seat only where the air is unwholesome; but likewise where the air is unequal; as you shall see many fine seats set upon a knap of ground, environed with higher hills round about it; whereby the heat of the sun is pent in, and the wind gathereth as in troughs; so as you shall have, and that suddenly, as great diversity of heat and cold as if you dwelt in several places. Neither is it ill air only that maketh an ill seat, but ill ways, ill markets, and, if you will consult with Momus, ill neighbours. I speak not of many more; want of water; want of wood, shade, and shelter; want of fruitfulness, and mixture of grounds of several natures; want of prospect; want of level grounds; want of places at some near distance for sports of hunting, hawking, and races; too near the sea, too remote; having the commodity of navigable rivers, or the discommodity of their overflowing; too far off from great cities, which may hinder business, or too near them, which lurcheth all provisions and maketh everything dear; where a man hath a great living laid together, and where he is scant: all of which, as it is impossible perhaps to find together, so it is good to know them, and think of them, that a man may take as many as he can; and, if he have several dwellings, that he sort them so that what he wanteth in the one he may find in the other. Lucullus answered Pompey well—who, when he saw his stately galleries and rooms so large and lightsome in one of his houses, said: "Surely an excellent place for summer, but how do you in winter?" Lucullus answered, "Why, do you not think me as wise as some fowl are, that ever change their abode towards the winter?"

To pass from the seat to the house itself; we will do as Cicero doth in the orator's art—who writes books *De Oratore*, and a book he entitles *Orator*, whereof the former delivers the precepts of the art, and the latter the perfection. We will therefore describe a princely palace, making a brief model thereof. For it is strange to see now in Europe such huge buildings as the Vatican and Escorial and some others be, and yet scarce a very fair room in them.

First, therefore, I say you cannot have a perfect palace, except you have two several sides; a side for the banquet, as is spoken of in the book of Hester, and a side for the household; the one for feasts and triumphs and the other for dwelling. I understand both these sides to be not only returns, but parts of the front; and to be uniform without though severally partitioned within; and to be on both sides of a great and stately tower in the midst of the front, that, as it were, joineth them together on either hand. I would have on the side of the banquet, in front, one only goodly room above stairs, of some forty foot high, and under it a room for a dressing or preparing place at times of triumphs. On the other side, which is the household side, I wish it divided at the first into a hall and a chapel (with a partition between), both of good state and bigness, and those not to go all the length, but to have at the further end a winter and a summer parlour, both fair. And under these rooms a fair and large cellar sunk under ground, and likewise some privy kitchens, with

butteries and pantries, and the like. As for the tower, I would have it two stories, of 18ft. high apiece, above the two wings, and a goodly leads upon the top, railed with statua's interposed, and the same tower to be divided into rooms, as shall be thought fit. The stairs likewise to the upper rooms, let them be upon a fair open newel, and finely railed in with images of wood, cast into a brass colour, and a very fair landing-place at the top. But this to be, if you do not point any of the lower rooms, for a dining place of servants. For, otherwise, you shall have the servants' dinner after your own, for the steam of it will come up as in a tunnel. And so much for the front. Only I understand the height of the first stairs to be sixteen foot, which is the height of the lower room.

Beyond this front is there to be a fair court, but three sides to it of a far lower building than the front. And in all the four corners of that court fair staircases, cast into turrets, on the outside, and not within the row of buildings themselves. But those towers are not to be of the height of the front, but rather proportionable to the lower building. Let the court not be paved, for that striketh up a great heat in summer and much cold in winter; but only some side alleys, with a cross, and the quarters to graze, being kept shorn, but not too near shorn. The row of return on the banquet side, let it be all stately galleries, in which galleries let there be three or five fine cupolas in the length of it, placed at equal distance, and fine coloured windows of several works. On the household side, chambers of presence and ordinary entertainments, with some bedchambers; and let all three sides be a double house, without thorough lights on the sides, that you may have rooms from the sun, both for forenoon and afternoon. Cast it also, that you may have rooms both for summer and winter—shady for summer and warm for winter. You shall have sometimes fair houses so full of glass that one cannot tell where to become to be out of the sun or cold. For inbowed windows, I hold them of good use (in cities, indeed, upright do better, in respect of the uniformity towards the street), for they be pretty retiring places for conference; and besides, they keep both the wind and sun off, for that which would strike almost through the room doth scarce pass the window. But let them be but few, four in the court, on the sides only.

Beyond this court, let there be an inward court, of the same square and height; which is to be environed with the garden on all sides; and in the inside, cloistered on all sides, upon decent and beautiful arches, as high as the first story. On the under story, towards the garden, let it be turned to a grotto, or place of shade, or estivation. And only have opening and windows towards the garden; and be level upon the floor, no whit sunken under ground, to avoid all dampishness. And let there be a fountain, or some fair work of statua's in the midst of this court; and to be paved as the other court was. These buildings to be for privy lodgings on both sides; and the end for privy galleries. Whereof you must foresee that one of them be for an infirmary, if the prince or any special person should be sick, with chambers, bed-chamber, ante-chamber [anti-chamber], and re-chamber [a back chamber], joining to it. This upon the second story. Upon the ground story, a fair gallery, open, upon pillars; and upon the third story likewise, an open gallery, upon pillars, to take the prospect and freshness of the garden. At both corners of the further side, by way of return, let there be two delicate or rich cabinets, daintily paved, richly hanged, glazed with crystalline glass, and a rich cupola in the midst; and all other elegance that may be thought upon. In the upper gallery, too, I wish that there may be, if the place will yield it, some fountains running in divers places from the wall, with some fine avoidances [outlets]. And thus much for the model of the palace; save that you must have, before you come to the front, three courts. A green court plain, with a wall about it; a second court of the same, but more garnished, with little turrets, or rather embellishments, upon the wall; and a third court, to make a square with

the front, but not to be built, nor yet enclosed with a naked wall, but enclosed with tarrasses, leaded aloft, and fairly garnished, on the three sides; and cloistered, on the inside, with pillars, and not with arches below. As for offices, let them stand at distance, with some low galleries, to pass from them to the palace itself.

New Patents.

These patents are open to opposition until July 16th.

1899.—Roof Coverings.—14,038. R. S. SMETHURST, Patricroft, Lancs. This invention relates to the manufacture of a waterproof material to be used in place of glass. Woven wire-cloth or perforated sheet metal is dipped into, brushed over, or run through a solution obtained by dissolving gelatine in water and adding when hot 10 per cent. of water to 5 per cent. of formic aldehyde, or other suitable acid; by which means the meshes in the wire-cloth become filled and the material is well coated on both sides. A coat of varnish or oxidised oil may be applied for very wet climates, and the gelatine may be coloured if desired.

Fireproof Windows.—14,231. J. W. SHEPARD, New York, U.S.A. The object of this invention is to provide a window which will be fireproof without employing shutters. For this purpose the frame and sash are made of metal and have openings for the admittance of air between the two sheets of wire-glass with which the window is furnished. When heat is applied to one side a rapid circulation of air is created between the panes, so carrying off the heat and preventing the second pane becoming dangerously hot.

Purifying Acetylene Gas.—14,379. E. GOODWIN, Dublin. The following composition can be used in any gas-washing apparatus for purifying acetylene gas:—Copper sulphate crystals, 1 part (by weight); infusorial earth, 1 part; water 48 parts.

Sheet Metal Cisterns.—14,740. W. P. BUTTERFIELD, Baildon, near Bradford. The joints of the plates forming the cistern are bent so that the edge of one plate overlaps and is folded into the edge of its neighbour, so facilitating the construction. No rivets are used. The joints may be permanently secured by soldering or by galvanising the cistern.

Preserving Wood.—16,732. C. D. ABEL, London, W.C. (*Berliner Holzcomptoir, Germany*). In this process tar-oil is the impregnating fluid, but the essential feature of the invention is the formation of a fine emulsion of tar-oil, produced by mixture with a dilute soap solution. In this way much less tar-oil is needed for the preservation of the wood (though an equally satisfactory result is secured), and the method of working is cleaner.

1900.—Gas Leakage Testing Apparatus.—4,539. E. SCHUSTER, Berlin, Germany. Near the top of an upright cylinder is a sieve, from which is suspended a central tube, open at its lower end. Within this tube is a smaller pipe, open at the top, connected with an air pump. Above the sieve is a gas outlet fitted with a cock, and on the top of the cylinder is a pressure gauge. The vessel is about half filled with gasoline, and air is then pumped through it into the gas pipe system until a certain pressure is reached, when the cock is closed. If, on reopening the cock, the pressure is shown to have decreased, the system is defective.

The following specifications were published on Saturday last, and are open to opposition until July 24th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—10,083, DAIX, mantles for incandescent lighting. 10,375, FARQUHAR, stand for supporting circular saws or similar articles

while being hammered, &c. 10,519, MONTGOMERY-MOORE and PRESTON, mechanism for closing and opening bulkhead and other doors. 10,588, HILL, edging for garden paths. 10,603, DAVIS and WADKIN, street sweeping machines. 10,616, DARBY, DARBY, DARBY PUNCHARD, and WILLIAM CHARLES PUNCHARD, circular-flame gas burners. 10,664, HILTON, metallic lathing. 10,671, PILKINGTON and ORMADY, utilisation of waste sand from glass grinding works for the manufacture of hones, grindstones, &c., crucibles, emery and other wheels, bath and fire bricks, tiles, ornamental slabs, imitation porcelain and pottery, &c. 11,473, RODNEY and LLEWELLYN, catches and locks for doors. 11,878, WIDMANN, process for making high relief plates from original drawings or original Indian ink sketches. 12,836, SCHNEIDER, process of manufacturing fireproof stones, applicable also in the manufacture of blocks from plastic compositions of coal tar and clay. 12,870, STUGG, compressing gases for various purposes in the arts. 13,052, SANDERS, incandescent gas burners. 13,072, REGOUT, muffle-furnaces or ovens. 13,257, SMITH, underground conduits for electric tramways. 13,874, EADIE, construction of cupolas. 13,166, MERRYWEATHER, hinges and catches for doors and gates. 14,346, BRANDON, apparatus for heating and moistening the air of conservatories, churches, dwelling-houses, &c. 14,514, BLEAZARD, construction of desks and seats used in schools. 14,571, JENNINGS, pipe joints. 14,594, ROWAN, emery wheel machines for polishing metal surfaces. 14,657, O'CONNELL, supports for window blinds. 14,869, MORGAN and WILLIAMS, flap valve for sewers. 14,870, MORGAN and WILLIAMS, system of ventilating sewers. 15,002, BARTON and JANDUS ARC LAMP and ELECTRIC CO., LIMITED, electric arc lamps. 15,021, BROOKS and HOLT, riveting tools. 15,425, HARRISON, means for carrying and attaching a plurality of tools or bits used in conjunction with a brace. 16,053, APT, illuminating media for use in incandescent gas lighting. 16,827, BLAKE, bituminous asphaltic composition for paving purposes. 18,867, STEVENSON, air-tight doors and frames, hinges and fastenings. 24,187, SIMPSON, means for opening the discharge valves of baths automatically. 24,685, TITUS and TITUS, excavating apparatus. 24,926, WELHAM, hot and cold water tap.

1900.—837, LAKE (*Shearman*), incandescent electric lamps. 840, LAKE (*Shearman*), incandescent electric lamps. 961, MORRISON, road-breaking and trenching machines. 1,907, POST, nut locks. 2,875, LORD, manufacture of files for sharpening saws. 4,195, WIDMANN, calcium carbide admission-valve for use with acetylene gas generators. 4,308, FESSENDEN, electric incandescent lamps. 4,531, BALL, steam heating systems. 4,884, BLUMENBERG and GLEUE, manufacture of hooks and nails by cold process. 5,065, REID, socket and spigot drain pipes. 5,108, HAACKE, process of manufacturing building and non-conducting material from cork cuttings or granulated cork. 5,700, ADAM, earth closets. 6,876, MCSHERRY and O'NEIL, metal window sashes and frames. 6,933, PAYNE, acetylene gas generators. 6,977, RUEGG, hinges. 7,022, WAGNER and LORENTZ, method of making mirrors with coloured decorations. 7,023, WAGNER and LORENTZ, mirrors with translucent coloured decorations. 2,077, HOFFMANN, hydraulic pressure dredging machines. 7,182, BATES, method of securing the glass in green-houses and similar buildings.

A Monument to Lord Roberts is proposed to be erected in the Guildhall. The monument commemorating Nelson's victories in the old City building cost about £4,400.

Medals for Artists.—Mr. W. Q. Orchardson and Sir Laurence Alma-Tadema have been awarded medals of honour for their paintings at the Paris Exhibition. In all, twenty medals of honour have been awarded. France receives seven, the United States two (Mr. Whistler and Mr. Sargent), England two, Germany two, and Belgium, Denmark, Holland, Spain, Norway, Russia, and Sweden one each.

Masters and Men.

The Edinburgh and Leith Masons have struck against the masters' proposal to reduce their wages from 9½d. to 9d. per hour.

The Fleetwood Joiners' Strike has been settled after an eleven months' struggle by the masters conceding a ¼d. per hour increase.

The Malvern Builders' Labourers have struck for an increase of 1d. per hour on the rate of 5d. The Urban Council have granted an increase to 5½d.

The Llandudno Stonemasons have struck for an advance of 1d. per hour on their wages, and demand to have the masters sign a number of rules.

Strike at Hull.—One hundred deal-carriers employed by timber importers on the quays of the Victoria Dock have struck for an advance of wages from 4s. 3d. to 5s. per day.

The Threatened Strike of Hawick Masons has been avoided by the masters withdrawing the intimation that they would reduce wages from 9d. to 8d. per hour.

London Brickmakers' Strike is practically settled, the masters having agreed to increase their offer of 5s. 3d. per thousand to 5s. 7d., which the men have accepted.

The Skipton Plumbers' Strike has been settled by an advance from 7½d. to 8d. being granted and a set of working rules agreed to by the masters. The men asked for 8½d.

The Norwich Bricklayers have struck for an advance of ¾d. per hour on the present rate of 7½d., a reduction in working hours from fifty-six to fifty-two and a half hours per week, and for an alteration of rules.

The Federated Builders' Labourers held a conference at Newcastle last week. The mayor, in welcoming the delegates, said he was glad to learn that the union had settled 90 per cent. of disputes without strikes.

The Peterhead Masons have struck in consequence of the masters having reduced their wages from 7½d. to 7d. per hour, as they claim to be still ½d. under the Aberdeen standard rate. About 150 men are affected.

Dundee Slaters' Strike Ended.—The Dundee slaters, who came out on strike in the beginning of May owing to a reduction of wages to the extent of a ½d. per hour have decided to resume work on the masters' terms.

The Strike in the Wigan Building Trade has been settled. The men asked for an increase from 6½d. to 7d. per hour, but have accepted the old rate of pay during the summer and 7d. per hour in the winter months.

The Strike of Bricklayers and Masons at Barrow with regard to which of the two should set the terra-cotta front of the new technical schools still continues. The masters, however, have decided in favour of the bricklayers.

Strike of Aberdeen Dock Labourers.—About 150 men, members of the Dock Labourers' Union, employed on board cargo vessels arriving at Aberdeen have struck for 7d. instead of 6d. per hour for day work, and 9d. instead of 8d. per hour for overtime.

The Barrow Plasterers have struck for an advance of wages from 8½d. to 9½d. per hour, and also to have the apprentices bound. The masters offered a compromise of 8¾d. per hour, on condition that the winter season was increased from twelve to fourteen weeks; this was refused.

Advances at Stockton.—The wages of the Stockton plasterers were officially recognised as being 10d. per hour from May 1st; 9½d. was the standard rate, but, owing to the scarcity of men, 10d. has been generally paid for some time. The Stockton slaters have received an advance of ½d. per hour. The Stockton painters' demands have been referred to arbitration as per rule. The Stockton bricklayers are now on strike for an advance of 1d. per hour, having twice refused an offer of ½d.

The Gasworkers and General Labourers' Union held a conference at Sunderland last week. Resolutions were passed in favour of an eight hours' day, of raising the age to fifteen in respect of child labour, and of the extension of the Workmen's Compensation Act to all sections of labour. The idea of making May 1st a general holiday throughout the country was also endorsed.

Perth Painters' Dispute.—A number of the apprentice painters of Perth went out on strike last week. This new development is said to have taken place at the instigation of the men, who have now been out on strike for a considerable number of weeks. The dispute arose through the operative painters asking the master painters to sign an agreement and rules at the busy season, and this the masters are determined not to do.

Amalgamated Society of Carpenters and Joiners.—The annual report of this society gives the income for the past year as £150,653, an increase of £7,887 over the previous year, and the expenditure £122,835, or £16,473 over that of the preceding year, for which trade privileges caused £11,606. The amount paid as unemployed benefit was £14,993, or £1,531 over the previous year. To replace tools lost by fire cost £2,905; sick benefit, £33,413, as against £29,978, an increase for the year of £3,435; funeral allowance, £5,806; accident benefit, £3,495; superannuation, £16,267; benevolent grants to widows and orphans of deceased members, £2,591; assistance to other trades, £1,851. The balance on hand at the close of the year was £200,530 13s. 2½d.

The Masons and Bricklayers at Falkirk have struck in consequence of several alterations in wages, &c., proposed by the masters. The masters desire that the yearly agreement should run from March to March instead of from June to June as formerly. They also take exception to the rule regulating the number of apprentices, which states that each firm start no more than one apprentice every eight months, and lastly they propose to reduce the wages—in the case of the masons from 9½d. to 8½d. per hour, and in the case of the bricklayers from 10d. to 9d. per hour. An agreement has been come to with the bricklayers on the apprentice question, it having been arranged that one apprentice for every three journeymen will be employed. To the other changes proposed the men are, however, opposed, and the masons object to all the changes. About 350 masons and 100 bricklayers are out.

Sale of Asphaltic Roofing Felt.—On Friday next, June 15th, Messrs. Knight, Frank and Rutley will sell by auction, at their sale galleries, 9, Conduit Street, and 23a, Maddox Street, W., about 700 rolls of asphaltic roofing felt in lengths of 16yds. to 25yds. each, and 76 rolls for damp courses. Catalogues free.

Hospital Extension in Leeds.—A Local Government Board enquiry was held on Friday last into the application of the Leeds Corporation to borrow £278,750 for extending the present hospital at Manston and building a smallpox hospital on the Killingbeck estate. The sum is made up as follows: £188,027 for extensions at Manston, £61,781 for the hospital at Killingbeck, and £28,942 for architect's fees and other expenses and general contingencies.

Restoration of St. Peter's Church, Derby.—At the ancient parish church of St. Peter, Derby, many improvements have been effected, and additional space has been secured sufficient to accommodate 125 worshippers, the work having been carried out by Messrs. Walker and Slater, under the direction of Mr. Hawley Lloyd, architect, of Birmingham. Though the church has been re-opened, the whole of the restoration scheme has not been completed. A new tower is being erected, new heating chambers and apparatus have been provided, and the electric light installation has been presented by Mr. Douglas Rickard, of Friargate. About £6,500 will be the entire cost of the work.

GLASGOW BUILDINGS REGULATIONS BILL.

THE third reading of this Bill (particulars of which were given on page 339 of our issue for January 3rd last) is expected to come on before the House of Lords' Committee on the 18th or 19th of June, and that formal proceeding over, the Bill will be transferred to the Commons, and will probably come before the Commons' Committee about the middle of July. The Glasgow Corporation have come to arrangements with several objectors. The main objections of the landowners were to the restrictions proposed to be put upon unfenced or unbuilt ground in the city, and to the powers proposed to be given to the Master of Works and Dean of Guild. In the Bill, as originally framed, it was proposed to enact that the Dean of Guild should not, except with the consent of the Corporation, authorise the formation or laying out of a street that was less than 50ft. wide; or, if intended for vehicular traffic, that the gradient should not be steeper than 1 in 12. A concession was granted in the case of the gradient by increasing it to 1 in 9, and in the case of the width of streets the new Bill proposes that: "The Dean of Guild shall not, except with the consent of the Corporation . . . grant decree for the formation or laying out of any street where the width . . . is less than 50ft.; or where the width, in case of a street, the distance of the building lines whereof is at least 30ft. from the centre, is less than 36ft.; or where the width, in case of a street, which from the configuration of the ground cannot be built upon except on one side thereof, is less than 30ft.; where such street exceeds 60ft. in length, and is proposed to be formed or laid out in such a manner that it will not at each end thereof afford direct communication with another street. . . ." As originally framed, the Bill proposed that every public street and public sewers therein should absolutely vest in the Corporation, and that the proprietors adjoining, notwithstanding that their titles authorised them to construct sewers underneath the pavement, should not be allowed to do so without the consent of the Corporation, the latter thereby gaining the right to use the solum of the public streets for municipal purposes. It has been conceded in the new Bill that the right of property should, as heretofore, remain in the proprietors' hands, so far as affecting the solum of the street; but that cellars should not in any case be constructed without the consent of the Corporation. As regards the height of buildings, it was originally proposed that, except by the Corporation, no building should be erected in or adjoining any street of a greater height than the width of the street and one-fifth more, and that in no case should a building, except with the consent of the Corporation, exceed 90ft. These restrictions were, however, exclusive of ornamental towers or other architectural features. In the new Bill the restrictions have been relaxed to allow the height of a building to be the width of the street and one-half more; the maximum height being raised to 100ft., with the proviso that where any existing building forming part of a continuous tenement or a continuous row exceeds the height above specified any other building in the same tenement or row, belonging at the passing of the Act to the same owner, may be carried to a height equal to but not exceeding that of the existing building. The greatest opposition to the whole Bill was in regard to the clauses dealing with the proposed control over the cubical extent of buildings. As originally framed it proposed that no division of a warehouse should extend to more than 350,000 cubic feet, with authority to the Corporation to grant in special circumstances permission to form a division of such warehouse to an extent not exceeding 500,000 cubic feet. As now arranged the maximum of 350,000 cubic feet has been retained, but the right of appeal to the Corporation has been increased, so as to enable them to give 750,000 cubic feet. With the clauses as now arranged substantial control will be obtained without undue inconvenience being entailed upon proprietors.

For example, if a warehouse having a cubical extent of 12,000,000ft. is burned down and comes to be re-erected, it cannot possibly be re-erected as it formerly existed, but it may contain one division of 900,000 cubic feet and about thirty other divisions each no more than 350,000 cubic feet each.

Trade and Craft.

Iron Buildings.

We have received from Messrs. Isaac Dixon and Co., of the Windsor Iron Works, Liverpool, and 25, Cockspur Street, London, S.W., a copy of their catalogue containing designs of steel and iron buildings. It is remarkable to note how extensive is the use of erections of this kind, and though—from an architectural point of view—we cannot but regard a church, for example, built of corrugated iron as an eyesore, there are numerous instances where an iron building is just what is needed. Messrs. Dixon have had forty years' experience and have completed more than 20,000 structures, facts which speak for themselves. They supply steel and iron buildings suitable for warehouses, dock sheds, engineering works, stores, pavilions, refreshment rooms, dwelling-houses, hospitals, and indeed buildings of every description and of all sizes, from a £9 tool-house to an exhibition building costing £6,750. Such a range ought to satisfy the most exacting purchaser. The firm has in course of preparation a catalogue illustrating some of the works they have executed during the last few years, including, in addition to home work, contracts for large ranges of iron and steel roofs and buildings supplied for Central America, West Africa, the Red Sea, India and other distant parts. For those of our readers who need particulars of iron buildings of every class we cannot do better than recommend an examination of Messrs. Dixon's catalogue, which, by-the-bye, shows plans as well as elevations, so making it all the more valuable.

The Uses of Asphalt.

Asphalt is certainly a material for the future, that is to say, it possesses qualities which are superlative in their own particular line. Yet there is asphalt and asphalt, and those who use it should particularly note that Messrs. Pilkington and Co., of Monument Chambers, King William Street, E.C., preface their catalogue with the four following facts: "That they are the oldest firm in the asphalt trade in England. That they supply only the best articles of their respective classes. That (taking quality into account) their prices compare favourably with those of any house in the asphalt trade. That they guarantee all work laid by them." Moreover, it is pointed out that the firm do not attempt to compete with those makers whose inferior goods prove so costly in the end and throw such discredit on the trade. Messrs. Pilkington are importers, manufacturers and merchants of Seyssel asphalt, Limmer asphalt, Catania asphalt, Polonceau asphalt, Lava asphalt, and White Silica asphalt, and are patentees of asphalt and felt roofing and acid-resisting asphalt. Seyssel asphalt is a natural product coming from the valley of the Rhone, and is especially suitable for covering flat roofs and terraces and for paving corridors, courtyards, &c. Limmer asphalt comes from Germany (near Hanover) and is similar to the kind just mentioned, though it is not quite so much liked; both should be used for all outdoor work. Polonceau asphalt is manufactured solely by Messrs. Pilkington, and for many purposes is cheaper and superior to the Seyssel brand. From the result of the tests made by Messrs. Kirkaldy and Son to ascertain the thrusting stress of asphalt damp course (between stones), we notice that with an area of 33·7 sq. in. of this asphalt, 42in. thick, at a temperature of 53deg. F., there was slight compression at 30,000lbs., or 57·2 tons per sq. ft., and that the material slightly squeezed out laterally at 286·2 tons per sq. ft. Lava asphalt is a good ordinary British variety, and White

Silica asphalt is very suitable, among other things, for lining ponds and fountains. Messrs. Pilkington's patent system of roofing consists first of a layer of Polonceanu asphalt $\frac{1}{2}$ in. thick, then a layer of specially-prepared hair felt, and a top coat of Seyssel asphalt $\frac{1}{2}$ in. thick; and all roofs made in this fashion are guaranteed for seven years. The firm's patent acid-resisting asphalt is the result of much experiment, and has been used with success at many London electric-lighting stations. Messrs. Pilkington have secured that highly commendable, but somewhat rare, reputation for supplying material of a uniformly good quality.

Edinburgh Architectural Association.

—This association recently held its annual excursion, visiting Balmerino Abbey, Balmreich Castle, and Lindores Abbey, by the kind permission of the Hon. Lieut.-Colonel Stuart Grey, the Earl of Zetland, and Mr. David Speirs. Mr. Hippolyte J. Blanc, R.S.A., acted as leader.

Keystones.

Richmond Grammar School has been enlarged.

Clapham Parish Church is proposed to be restored and enlarged.

A New Post Office at West Hartlepool has been built at a cost of £15,000.

A new Organ at Battersea Polytechnic has been built by Messrs. Beale and Thynne.

Wallasey Art School, Liverpool, is proposed to be altered and extended at a cost of £2,000.

The New Sessions House.—At tomorrow's (Thursday's) meeting of the City Corporation the name of the successful architect for this new building will be announced.

Alterations to Stow Workhouse.—Mr. J. S. Corder has been asked to prepare the necessary plans and estimates for proposed alterations to Stow Workhouse for the approval of the Guardians.

New Friends' Meeting-house for Southport.—The Society of Friends in Southport are about to erect a new meeting-house at a cost of £2,500, which is to supersede a building that has stood for a century.

Northern Architectural Association.—The members of this Association visited Jarrow Church and Tynemouth Priory on Saturday last. The president, Mr. William Glover, was among the party.

A new Board School at Oulton, Lowestoft, has been built from the designs of Mr. F. W. Richards, M.S.A., of Lowestoft, Messrs. Scarle and G. Beckett, of Carlton Colville, being the contractors. Accommodation is provided for 150 infants, and the central hall is 53ft. by 25ft.

St. Mary's, Soho.—This church has passed through many vicissitudes. It was built in 1677 by a Greek Archbishop, and two years ago the old nave was demolished by the London County Council because it had become a dangerous structure under the Act. Now, however, there is going to be a renovation, the corner-stone of the new nave having been laid on Monday last.

New Conservative Club at Brixham, Torquay.—The foundation-stones were recently laid of a new Conservative club in course of erection at Brixham from designs by Mr. E. Richards, architect. The building adjoins the Market Hall by the Bolton Cross, and will be of limestone from the Barton quarries, with Bath stone dressings. The site cost £200, and the contract for the building, which is being erected by Messrs. Hazlewood Brothers, amounts to £1,137.

The Removal of Newgate.—The transformation of the old military prison on Brixton Hill, which is to take the place of Newgate, will occupy nearly two years. With the exception of the north and south wings and the chapel, all the interior of the prison is to be rebuilt. On the west side of the prison yard, which is to be extended, a large cell wing 157ft. by 48ft. will contain the execution pit, mortuary, infirmary, and workshop. Being separated from the high road by an avenue of lime trees, the new prison will be well hidden from view.

Proposed New Fire Stations for Liverpool.—At the last meeting of the Liverpool City Council Mr. Houlst, in proposing the adoption of the general proceedings of the Watch Committee, referred to a minute with regard to the suggested provision of new fire stations for the city. In 1898, he said, a sum of £40,000 was voted by the Council for the erection of new fire stations. It was afterwards ascertained that the scheme would cost something like £53,000, this being the result of an advance in the cost of material and in wages. Owing to the erection of fire signals, &c., the circumstances under which the expenditure was decided upon had altered, and the head constable had reported that there was no immediate necessity for proceeding with the work. After discussion, the proceedings of the Committee were confirmed.

A new Central Fire Station at Edinburgh was opened last week. Mr. Robert Morham was the architect, and Messrs. Kinnear and Moodie were the contractors.

St Columb Major Church, Cornwall, is proposed to be restored. Mr. G. H. Fellowes Pryne has prepared a report in which the necessary work is estimated to cost £2,500.

The Essex Archaeological Society held its quarterly excursion on Saturday, when Nevendon, Benfleet, and Thundersley were visited. Mr. G. F. Beaumont, the hon. secretary, acted as leader.

Ruins of Baalbec.—At a recent meeting held at the New Palace, Potsdam, the German Emperor being present, the proposed expedition to Baalbec was considered. Several architects were present.

New Municipal Buildings for Hereford.—Certain premises in Owen Street, Hereford, have been offered by a Miss Johnson and her sisters for the erection of new municipal buildings. The offer has been accepted.

Nottingham Architectural Society.—The annual report of the Council for 1899 states that the total membership is now fifty-three, consisting of thirty-one members and twenty-two associates. There is a balance at the bank of £31 3s. 6d.

A new Wesleyan Chapel at Scunthorpe, Doncaster, has just been completed from designs by Mr. John M. Dossor, A.R.I.B.A., of Hull. The building has cost £4,190, the land £2,200, and new Sunday schools are being built at a cost of £1,500.

Workmen's Dwellings in Aberdeen.—Tenders amounting to £2,314 10s. have been accepted for the erection of artisans' dwellings in Roslin Street, Aberdeen. Tenders amounting to £3,140 19s. have also been accepted for erecting similar dwellings in Park Road, Aberdeen.

Municipal Insurance.—The conference of London local authorities convened by the Shoreditch Vestry resolved, on Thursday last, to adopt a system of mutual insurance, in order to escape the large amounts paid by the authorities in insuring municipal property. A committee was appointed to formulate a scheme upon the lines adopted by the Nottingham and Glasgow corporations.

Plenty More Chapels.—The Wesleyan Chapel Committee at its last meeting gave official sanction for the erection forthwith of twenty-four new chapels, estimated to cost £52,210; for thirty cases of enlargement, &c., estimated to cost £2,000; for eight ministers' houses, one Sunday school, nine new organs, and an additional outlay on works previously sanctioned, amounting in the aggregate to fully £90,000.

The Death is Announced of the Count de Marsy.—He was among the chief promoters of the law in France relating to the protection of ancient buildings, and the classification of such as were thereafter registered as national monuments. The Comte de Marsy was probably most widely known in his capacity as Director of the French Society of Archaeology, and as president of the yearly congresses of that learned body.

A Famous Old Bridge.—The old bridge at Brentford, spanning the little river Brent immediately before it flows into the Thames, is threatened with destruction. In Leland's day it was a wooden structure of three arches, probably the self-same bridge across which in olden times Christian passengers were permitted to pass free of toll, whereas Jews and Jewesses were forced to pay a half-penny if on foot, and one penny if on horseback.

Undercliff Hospital Competition.—At a meeting of the Undercliff Isolation Hospital Committee, held at Ventnor on Wednesday last, it was decided that the first premium (£20) in the recent competition for the proposed new hospital building should be given to the designs marked "Aeration," and the second premium (£10) to the designs marked "Desormais." These designs are respectively by Mr. George Broughton, of Ryde, I.W., and Mr. Edward L. Gaunt, of London, W.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.

To the Architect, Artist, and Craftsman.

HERE is no other publication now issued which deals so comprehensively with matters of interest to Architects, Artists, and Craftsmen, as the "ARCHITECTURAL REVIEW." It deals with all the finest examples of Ancient and Modern Craft, and is invaluable as a record of Architecture and Design.

The contents of the JUNE NUMBER, now on Sale, are:—

WILLIAM BUTTERFIELD: By Halsey Ricardo: Part One.

THE NEW TOWN HALL AND MUNICIPAL BUILDINGS, CHATHAM.

MEN WHO WORKED IN PEWTER: By H. J. L. J. Masse.

DECORATIVE CRAFTS IN POETRY: By Ethel Wheeler.

THE LIFE AND WORK OF ROBERT ADAM: By Percy Fitzgerald, M.A., F.S.A.: Part Two.

THE TOWN AND CASTLE OF ANNECY: Written and Illustrated by J. P. Cooper: Part Two.

THE ROYAL ACADEMY EXHIBITION: A Candid Criticism.

Current Architecture:

Which includes the Designs of the following:—

New Boarders' House, Bradfield College, Berks: Mervyn E. Macartney, Architect.
New Part of Edgeworth Manor, Gloucester: Ernest George and Yeates, Architects.
Parish Hall and Club Room, Hungerford, Berks: A. C. Blomfield, Architect.
"Disappearing London" Plate, Occasional Notes, Reviews of Books, &c., &c.

Price 1/- Nett.

Architecture and Crafts at the Academy.

Of the Special Number of the "ARCHITECTURAL REVIEW," devoted to Architecture and Crafts at the Royal Academy, a few copies still remain out of the large Edition issued. This Special Number contains over one hundred reproductions, and is the most complete and permanent record of current architecture.

The following are some of the opinions expressed on that number:

The Printing and get up of the Magazine are worthy of high praise."—THE GLOBE.
The reproductions are all executed with rare delicacy and finish. It is hardly possible to conceive that any of the various processes of artistic reproduction can be carried to a higher degree of excellence than is here exemplified."—EAST ANGLIAN DAILY NEWS.

The Illustrations are beautifully done."—GLASGOW DAILY RECORD.

The Number is a most varied and interesting one."—BELFAST EVENING TELEGRAPH.

The Number is in itself a work of Art."—PERTH CONSTITUTIONAL.

The best Architectural Drawings in the Royal Academy are illustrated in most beautiful style. They will certainly convey a number of delightful ideas for future use."—THE QUEEN.

The whole Number is one of which any publisher may be justly proud."—EASTERN MORNING NEWS.

This publication is an exceedingly useful one, giving in small compass an excellent impression of what the Hanging Committee of the Royal Academy consider the representative work of the year."—BRADFORD OBSERVER.

FFINGHAM HOUSE, ARUNDEL STREET, STRAND, LONDON, W.C.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

CLACTON-ON-SEA.—For the erection of a house to be built in the Harrow-road. Mr. R. Mawhood, architect, 2, Market-road, Chelmsford:—
Shillitoe £2,500 | E. West, Chelmsford
Linzell 2,287 | and Clacton* £1,993
* Accepted.

CHELMSFORD.—For the erection of nine cottages for the Chelmsford Star Co-operative Society. Mr. R. Mawhood, architect, 2, Market-road Chelmsford:—
Lummis and Son £2,353 | W. Sannus £2,110

* Accepted.

COMPETITIONS.

ADMINISTRATIVE COUNTY of the ISLE OF WIGHT.

PLANS FOR PUBLIC LIBRARY, READING-ROOM, TECHNICAL INSTITUTE, &c.

"VECTA."

NOTICE.

The Architect whose designs were forwarded to the County Council of the Isle of Wight under above Motto is requested to SEND to the undersigned, under sealed cover, his NAME and ADDRESS, as well as the Specification and Estimate referred to in the instructions, these not having been delivered with the Plans owing to the package being broken in transit by rail.

WILLIAM H. WOOLDRIDGE,

Clerk to the County Council.

No. 20, Holyrood-street,
Newport, Isle of Wight,
June, 1900.

COUNTY BOROUGH of CARDIFF.

TO ARCHITECTS.

The Corporation of Cardiff invite COMPETITIVE DESIGNS for their proposed NEW ASYLUM for 1,250 patients at Whitechurch, near Cardiff.

The Competition will be in two stages.

The first stage will be open to all architects, and the drawings therefore must be to a small scale in pencil. From the designs submitted in that stage the authors of six will be selected to enter the second stage of the Competition, the drawings to be in ink according to the requirements of the Lunacy Commissioners. A premium of One Hundred Guineas will be paid to each competitor in the second stage who complies with the conditions, and the successful competitor placed first will be employed to carry out the buildings on the terms stated in the conditions.

Printed conditions and instructions can be obtained on application to the Borough Engineer, Town Hall, Cardiff, on payment of One Guinea, which will be returned on receipt of a bona-fide design, or if the conditions are returned by JUNE 30th. In the selection of the designs the Corporation will be advised by Mr. G. T. HINE, Architect to the Commissioners in Lunacy, as Professional Assessor, whose decision shall govern the selection of the designs and be final and binding in all stages of the Competition.

Designs in the preliminary stage of the Competition, sealed and endorsed "Design for New Asylum," must be delivered to the Borough Engineer not later than TWELVE o'clock noon, on SATURDAY, AUGUST 25th, 1900.

By order,

J. L. WHEATLEY,

Town Hall, Cardiff,
May, 1900.

Town Clerk.

An Architectural Causerie.

A Plea for Critics.

DISRAELI'S epigram on the subject of "Critics" has often served as a vent for the irrita-

tion of the professional man when smarting under an appreciation of his efforts which rates them less highly than he and his friends are disposed to do; and it is so quotable that many of the public, with or without the right to express an opinion upon matters pertaining to the domain of art, glibly repeat it, without thinking of the injustice which they are thereby inflicting, for the gibe has just so much of truth in it as to make it impossible to meet it with a flat denial. Critics often *may be* those who have failed in art and literature no doubt, for those who have succeeded keep for the most part to the exercise of a much more lucrative calling. Why should the successful artist leave his pleasant labours and trouble himself to enlighten an unresponsive public as to the merits or demerits of the productions of his fellows?—working, as he does, just when he pleases, as long as he pleases at what pleases him, and obtaining from the public what price he pleases. Or the successful dramatist or literary man whose income is counted by thousands, and who surely must be weary of labour with book and pen. Why should they trouble themselves to prolong that labour for the pittance which for the most part is all that an editor thinks criticism to be worth? Far better is it for them to spend the time in recreation and recuperation. At the same time the most virulent opponent of the critics can scarcely maintain that it is not an advantage, both to the public and to the man criticised, for them to have some practical acquaintance with the various arts upon the practitioners of which they pass judgment, and most certainly those whose knowledge enables them to speak intelligently, who are able to realise what difficulties have been confronted and overcome, are much more likely to be listened to when they express an opinion than others whose words show that they are speaking without any real comprehension of the problems which the artist has set himself to solve.

But if this be granted, and it be found impracticable to obtain the opinions of acknowledged masters, surely the next best

thing is to apply to those who have been less successful in obtaining the patronage of the public, though perhaps not less well equipped for success in other ways, for it must not be forgotten that "success," as the word is understood nowadays, depends upon the combination of many factors, and that it is not always the best artist who is most successful, even from the artist's point of view. For commercial success it is necessary to produce continuously things which are up to the same standard (which may perhaps gradually rise a little), and are so much on the same lines as to be immediately recognisable as being by the same hand. Every patron requires a "characteristic example," and the ambition which attempts quite different subjects and

and distinguish the meretricious from the excellent, instead of endeavouring to make the public laugh and the unfortunate artist squirm by a clever, smartly-written article—that he should, in fact, think more of art and of the things which he is supposed to be judging and less of himself and his reputation for cleverness. But it is plain that such unattractive conscientious work is not likely to be done by the brilliant man whose talents take him to the front rank, while he who is less successful in gaining the approval of the public for his own work may help others to the appreciation denied himself, at the same time assisting the ultimate triumph of the principles which guided him in his efforts in the cause of art. A. W.

AT BURFORD, OXON. DRAWN BY WILLIAM A. PITE. (See p. 359.)

treatment is generally unrewarded. Whereas the truly original artist is not satisfied with repeating his previous successes, he is ever striving to conquer for himself fresh heights, and sometimes finds the steep too great for his powers at the first or even second attempt. Such works are not at first glance recognisable as his, and fail of complete success both from his own point of view and from that of the market. In fact, it is arguable that popular success in art, with its tangible rewards, has nothing to do with artistry, but depends upon quite other qualities, though it does sometimes happen that success in both directions comes to the same person. It would be invidious to give instances, though names must spring to the lips of anyone who has lived thirty years and interested himself in matters of art, of those who have achieved popular successes which are not also artistic. The truth is that, in England at all events, the public has no criterion by which it may judge in matters of art, and that the conscientious critic may fill a most useful rôle if he be content to draw attention to the qualities which are likely to escape casual notice and public appreciation,

Toole's Theatre. STRANGE are the histories and varied the careers of many among London's buildings, but few have had such odd fortunes as those of the houses numbered 24 and 25, King William Street, Strand, which were last known as Toole's Theatre, and are now to be demolished for the impending enlargement of Charing Cross Hospital. King William Street, Strand, is a relic of that very busy era of rebuilding in London, the 20's and 30's of this expiring century, when Nash, the arch-beautifier, that—

Very great master
Who found us all brick and left us all plaster,

was actively engaged in setting out new and palatial streets and building stucco-fronted houses; and its tall and substantial buildings, designed in a Classic convention, have a certain dignity. As the name of the street implies, it was completed in the reign of William the Fourth. Already many of the streets and isolated buildings of that era, of which Londoners were at the time so proud, have given way to modern improvements. Even Regent Street's long and regular lines

have been broken by new structures not at all in accord with Nash's ideas, and the rather fine architectural scheme of St. Bride's Court, Fleet Street, which belonged to the same period, has only this month

TOOLE'S THEATRE. DRAWN BY C. G. HARPER.

disappeared under the pickaxe of the house-breaker in operations for the widening of Fleet Street.

King William Street, like New Oxford Street, Waterloo Place, and the Regent's Park district, where stucco most does flourish, has hitherto seen little change, but its time has apparently come after some seventy years. Toole's Theatre, about to be absorbed by the great hospital, was originally a whisky store. It was afterwards taken over for the use of the Roman Catholic Church in 1849, when the Oratorians came to London, under the control of the late Cardinal Manning. The Oratorians remained here until 1852, and then removed to the outlandish district of Brompton, since dignified and civilized under the fashionable name of "South Kensington." They secured a site in these wilds, since covered by a stately church. After an interval the deserted building in King William Street experienced another odd change, and was converted into a place of amusement, under the name of the Charing Cross Theatre, afterwards known as the Folly Theatre; it was leased in later years by that popular comedian, J. L. Toole, who renamed it after himself.

The pending enlargement of Charing Cross Hospital, so long contemplated, is to cost more than £80,000, and will, when completed, place that institution on a level with the other great hospitals of the metropolis.

C. G. H.

On Reflection.

THE L.C.C. has great ideas and unloads them occasionally on the subordinate vestries, who sit appalled by their immensity. Like Mr. Hooley, the L.C.C. deals in millions and is not afraid; but to a vestry like Fulham, which debates half the night over an expenditure of £20, the proposition to vote a scheme, costing a little half-a-million, before the vacation begins, comes something like the shock of the Serpentine to the early bather. The dream of the L.C.C. just now is to become a great tramway proprietor. Trams to the north of them, trams to the south of them, trams all round them. With this idea it has prepared two big schemes to beautify London generally, one a tramway route from Harlesden to Putney Bridge, *via* Fulham Palace Road, and another from the Bank along the Embankment, Victoria Street and Chelsea to Putney Bridge. What evil Putney Bridge has wrought that it should have this double visitation we do not know. But this is not all. These systems are to be connected with the southern lines across Battersea Bridge to Clapham. Fancy anybody wanting a second Clapham Junction. For these little undertakings the L.C.C. requires money, and suggests that the various vestries should contribute in view of increased trade and other (undefined) advantages. The vestries are a little appalled at the prospect. Like a few of the outsiders, they feel that trams which can bring desirable people into their neighbourhoods may just as easily bring undesirable customers. And this result, at a cost of half-a-million sterling, can hardly be considered a good bargain. So at present each vestry is inclined to sit on the fence and see what the other vestries say, and, as they are all going to do the same thing, the L.C.C. may have to wait some time for a definite answer.

Uniform By-laws. A PAPER will be read at the Architectural Congress next Friday on the desirability or otherwise of uniform building by-laws. What opinion will be vouchsafed by the lecturer remains to be seen, but in any case the subject is a thorny one, and likely to provoke discussion. It is felt by many competent authorities that the Model By-laws, from which the majority of the local bodies draft their regulations, are not so comprehensive or far-reaching as they should be, and that the first requisite is a new standard of building law. Doubtless, the argument of one law for the town and one for the country will find its exponent; and, to a certain extent, this must necessarily be correct, because many forms of building, as, for instance, earth-closets where there is no water-carriage sewage system, are legitimate in the country though prohibited in towns. Still we have always thought that the necessary requirements for satisfactory building in town or country might, up to a certain point, be enacted by law. A consolidation, too, of some of the Acts bearing upon building would also be beneficial. The admittedly imperfect London Building Act has been supplemented by several sets of

by-laws in connection with special works, and the reading of all these becomes somewhat confusing. A building law of minimum requirements for the whole of the United Kingdom, containing separate schedules of regulations for special buildings, such as theatres, &c., would be a boon to the architectural world, and of inestimable benefit in constructional work. There seems to be an idea abroad that anything will do for the country, and this insuperably foolish notion leads architects to design pretty houses rather than healthy ones. One design for a country house that recently came before our notice showed all the bedrooms in the roof, so that it was impossible to stand upright in three-quarters of the space, to say nothing of dark corners resulting from dormer windows and the impossibility of putting in a bed except across the door, window, or fireplace. Yet this house had a most pleasing exterior, and that is probably what it would be judged by. An acquaintance, who had bought a very pretty house, admitted some months afterwards that he regretted his purchase, because the district was so relaxing. Seeing that he was living in one of the most bracing parts of the Peak district the remark sounded foolish, and he was afterwards persuaded to re-model his house, build the bedrooms up square, and enlarge all the windows. As a result there has been no return of the headaches and general lassitude which he formerly experienced. These are questions which should all be dealt with in one ideal building Act. To say, because a man lives in a healthy country district, that there should be less stringent building regulations, and that the pure air outside his house will compensate him for the unhealthiness in it, is an absurdity that requires no comment.

Window Boxes. THE householder's thoughts naturally revert, at this period of the year, to the subject of window boxes, and the average Englishman's taste in such is not one to be commended. Generally, in the matter of colour, the English idea is sober; the range of colour for the male thing's clothes is somewhat restricted, and though his better half can, and, at times, does appear to rival the rainbow, we, as a nation, have never even approached the brilliancy of our Continental neighbours. Still, the love of brilliant colours, a survival of the primitive days of savagery, does exist in us somewhere in a greater or lesser degree, and what is bred in the bone comes out in the flesh. An Englishman rarely cares to be conspicuous in his dress, at least in his own country, and now that we are beginning to appreciate the vulgarity of flaring wall-papers and plush-covered suites at £5 5s. on the hire system, we let ourselves go in the matter of our window boxes. No doubt flowers have a natural and proper gaiety, but when you remove them from their native heath and distribute them about the outside of your dwellings, it is as well to see that there is not a hue and cry in various senses. Exactly what should be said to a man who, having a pink-brick house, adorns it with window boxes, faced with peacock blue and sage-green tiles, and plants therein a bottom row of trailing pink geranium, a middle row of blue lobelia, and a back row of white marguerites, is a matter of conjecture, and we have seen worse combinations. As the flowers are of more importance than their receptacles, we would suggest that the latter be kept as inconspicuous as possible. The colours of beautiful flowers may be forgiven in any combination, but the colour of glazed tiles is not always a thing of beauty and a joy for ever, especially when taken in conjunction with the late Victorian Utilitarian style.

PEOPLE'S ALTAR IN NAVE, ST. JOHN THE BAPTIST'S CHURCH, BURFORD. DRAWN BY WILLIAM A. PITE.

BURFORD, OXON.

By WILLIAM A. PITE.

SCATTERED up and down the country are numbers of small old-world towns left high and dry by our railway systems, cut off from urban intercourse, and insulated in rural districts. Their prosperity has declined with the advance of time, and the place to which but a few years before the stage coach brought business and bustling activity has now become a sleepy hollow and a quiet record of an historical past, a past which the average Englishman will do well to revere and preserve.

Some such places may rise in the reader's memory, and while many annually flock to the antiquities of Holland, Belgium, and Germany, how few there are who take the trouble to consider what treasure there is in this England of ours?

The town of Burford, in Oxfordshire, is such as merits the foregoing description. Buried away in the county, adjacent to the once famed Wychwood Forest, it is now desolate and silent, far from the screech of the locomotive and the hum of life. It is still easily reached from Witney or Bampton. The coach road enters the town by a wide and characteristic street, where the burghers found their prosperity and made the place famous for its saddlery and other goods. The records go back to an early date, a synod being held here in A.D. 704. This air of upright antiquity Burford still retains, and it is abundantly witnessed by many quaint streets and by-ways with much ancient work in evidence, all culminating in the great and wondrous Church of St. John the Baptist, replete with architectural interest and antiquarian enigma, sufficient to occupy and tax the speculation of architect or archaeologist, whether he be given to reflection or garrulity, for many a day.

At the bottom of the street is the ancient stone bridge spanning with four arches, besides massive abutments, the river Windrush. No doubt the local authorities will tell us the bridge is "old and inconvenient," but still, it is Burford Bridge, and so over it we go to the rolling country beyond, leaving the characteristic and beautiful ruins of the Priory on the left (immortalised by Mr. Waller's well-

known pictures), and to the right on the hill the little church of Fulbrook with its village-wrought work.

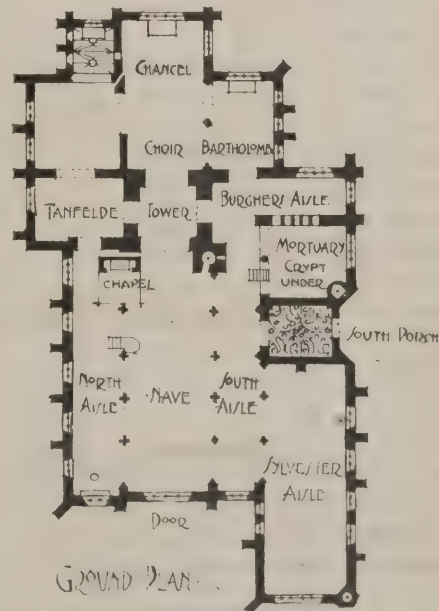

The great church would require a book to itself. Rambling and many-aisled, it is probably unique. The size and importance of the edifice gives us some idea of what must really have been the great importance of Burford Church; its scale, extent, and interest can only be described as magnificent. Some of its features may with advantage be briefly referred to. To begin with, it is grander than the general run of parish churches, and holds its own against such notable local rivals as Bloxham, Bampton-in-the-Bush, and Witney, and this is no slight thing to say.

I know of no church that I have seen which presents such irregularity (which a reference to the sketch plan will demonstrate); the possible theory has been advanced that two buildings have been united. What is now designated the Sylvester aisle, at the west end, may have been a distinct chapel detached from the church. This was without doubt founded in the thirteenth century, while in the fifteenth century the north wall was opened by arches into the church proper, and extended eastwards, so that the magnificent Perpendicular porch and parvise (probably one of the finest in England), at first partly detached, has become entirely embedded between this and one of the south transepts.

The central tower, which is of twelfth century work in the lower stages, exquisite in detail, and late fifteenth century in the upper part and spire, cuts the building in two, its narrow arches greatly assisting this undesirable end. Beneath the tower is much interesting evidence respecting the lines of former roofs to the nave. The church in mediæval days being in frequent daily use in a way which we of to-day can hardly realise, very great inconvenience must have been felt and resulted from the general arrangement. The altar at the east end in the chancel ceremonially must have been at a great disadvantage congregationally. In order to remedy this a most ingenious and interesting expedient was resorted to; a people's altar was erected on the west side of the tower. This unique feature is here illustrated. In appearance it is not unlike a large pew; and in later times it no doubt was used as such, being generally known as the Priory

pew. Enclosed in screen work, with a tester over, the altar and reredos are of stone with a squint east. To this point more people can look than from any other part of the church, and but little obstruction is caused by the columns of the Sylvester aisle. The church possesses an interesting font, and an adjacent stone bench, but nine inches off the floor, presents a nice problem in levels. The font is marked with English history. In May, 1649, the Levellers (by the way, what a characteristic name for the times), after holding Banbury, were driven back to Burford, and were all killed or taken prisoners. Many were confined in the church, one of whom, "Anthonye Sedley Prisner," rudely carved these words on the font.

A great deal more might be said. The church abounds with monuments, and the student of heraldry will find much to unravel in the Renaissance tombs and other remains of antiquity which, it is trusted, may ever remain our treasured heritage.

ST. JOHN THE BAPTIST, BURFORD.

IN THE HIGH STREET, BURFORD. SKETCHED BY WILLIAM A. PITE. (See p. 359.)

LANDSCAPE ARCHITECTURE.

By GUY LOWELL.

THE development of material prosperity in the United States, followed by a widespread activity in erecting fine buildings and in decorating them beautifully, has once more proved the truth of Lord Bacon's statement that, "when ages grow to civility and elegancy, men come to build stately sooner than to garden finely, as if gardening were the greater perfection." Americans have long since realised that, to have fine buildings, they must employ skilled architects, but it is only recently that they have begun to understand that landscape gardening is an art which requires as much study and training as architecture. And because men have "come to build stately," and realise the importance of "gardening finely," there is a constantly increasing demand for landscape architects.

There has always been, and there probably always will be, a number of able engineers, architects, and horticulturists who have drifted into the profession of landscape gardening; and there are others who will

always believe that the sphere of the landscape architect is confined to beautifying roads and bridges, improving the surroundings of a building, or grouping rare plants so as to produce a pleasing effect. Actually, the field of landscape art is far broader than that, requiring a knowledge of many things and drawing no line between itself and other arts and professions. Because the landscape architect should be a civil engineer, an architect and an expert gardener, or at least be as thoroughly grounded as is possible for one man to be in the principles of all three professions, it is a mistake to suppose that his education can stop there. Landscape architecture requires a special training, and, not being a branch of any other art, ought not to be treated as a specialisation of some other profession. But, because it has so much in common with the professions already mentioned, it can best be taught in fellowship with them; and therein lies the exceptional advantage in teaching landscape architecture where there are already well-founded courses in architecture and in civil engineering.

In Paris, the academic system of teaching art has been worked out so carefully that France is now admitted to be the centre

of the art students' world, painters, sculptors, and architects all working under the same roof; at the École des Beaux-Arts the sculptor and painter have to take a course in architecture, and the architect and the painter have to learn to model. Surely much of the good that comes from the French method is due to this broadening education. In the age of Pericles and at the time of the Italian Renaissance the different arts were studied side by side; and what proved wise in Greece, in Italy, and in France, will be found best in America and in this country to-day.

The new course in landscape architecture at the Institute of Technology at Boston, Mass., is at present classified as an option in the architectural course; but, though classified with that department, the subjects to be studied are well distributed among several other groups. From the beginning of the second year, when the student is for the first time allowed to specialise, he is trained in drawing, in architectural design, in the principles of art in general, and in the art of landscape design in particular. Through the third and fourth years he is kept studying examples, drawing, designing, creating, analysing, results, solving problems similar to those he will encounter during his professional career, working side by side with the architect, as he will be called on to do later in life, studying civil engineering, so that he may be able to design appropriately and execute his conceptions properly, and combining with all this a thorough course in the use and habits of plants. It is fortunate that the architectural department of the Institute of Technology is so well organised and so successful in its results, because many artistic principles are common to both architecture and landscape gardening, and many of the practical problems to be solved are alike in both cases.

What is true of the architectural department is in turn true of the courses in engineering. A student must be able to survey and make topographical drawings, he must understand the principles of highway engineering and of bridge building, of estimating quantities, and of properly draining land.

While the student is observing the effects that nature produces, while he is learning the constructive side in the engineering courses, while he is learning to draw and compose, he is being drilled in using his knowledge at the drawing board. For, though the eye be well

STONE BRIDGE BURFORD. MEASURED AND DRAWN BY WILLIAM A. PITE. (See p. 359.)

trained and the mind well stocked, the student must be able to summarise his knowledge in designing, and skill in design is the result of constant practice.

The work is necessarily hard, and the years of study long, for much is required of the landscape architect to-day. And yet the student should remember that he must in every way avoid a narrow life or a narrow point of view; for the problems to be solved are many and complex, and his noblest mission should always be to bring the love of nature nearer to the hearts of the people.

THE BRICK TRADE.

NOTWITHSTANDING the general prosperity of last year the brick trade benefited only in sections. Everywhere wages and prices went up and demand was continuous, but the clay handler often found himself threatened with a balance on the wrong side. For example, in Kent and Essex, the brickmakers found the trade going from very fair to bad as the year wore on, and now the view they take of this season is one of unrelieved gloom. They blame very largely the excessive competition of the Midland and Birmingham districts, where production has been intensified of late. Three or four good seasons have followed one another for the Essex and Kent clay-workers since the strike, but now a decided reversion is evident, and, as prices are sinking slowly but steadily, there is every prospect that the manufacturers will be compelled to recoup themselves by recalling the twenty per cent. increase in wages given to the operatives.

Belfast tells the same story of slack trade last year, and an outlook for this year marked by keen competition and a perpetual weakening of prices. Two thousand fewer brick buildings were put up in Belfast last year than in 1898, and seven hundred fewer than in 1897.

Such centres as Newcastle-on-Tyne, the great sea door for the northern coal mining regions, tell of a year of extensive trade. In the fire clay business, the oldest inhabitant knows of none busier. In the production of fire bricks the demand last year was superior to any since the prosperous years between 1872 and 1874.

But the prosperity brings its own troubles. For instance, in Exeter, where the brickyards have been in profitable and active use for a long time past, the house-builders are going in for brickmaking themselves. They have not yet ceased to buy bricks from the three local works, but they are hard at work getting a complete plant erected, and then expect very soon to have their co-operative scheme in operation.

Blue bricks, which are in heavy demand for engineering, sewerage, and water schemes, found a brisk market last year, and one which gives every promise of continuing for some time ahead. Prices are on the rise, and are such that, notwithstanding the high price of fuel occasioned by the war, satisfactory profits will be earned. The London market is a standing one. The number of new houses built in London from 1849 to 1897 was 633,615, and nearly 7,000 houses are in course of erection.

British brickmakers have but to come to a more cordial understanding amongst themselves to reap a golden harvest of profit from all this.

Since the inauguration of the Workmen's Compensation Act, employers of labour have to face a very serious risk of loss by accidents occurring to their work people. Clayworkers, especially, saw this, and hence there has arisen the British Clayworkers' Mutual Insurance Co. For a small premium the brickmaker, &c., is relieved from worrying about claims for compensation. So economically is the concern worked, that for the first year of trading it pays all claims and a 10 per cent. dividend to members. Premiums were £2650, and claims £750.

Makers of glazed brick are likely to have trouble with the Home Secretary, who purposes bringing glazed manufacturers under the heading of people carrying on a noxious trade, because of the lead compounds used to secure brilliancy, etc. This will mean a large expenditure of money to carry out many stringent rules, or else the abandonment of lead glazes and a consequent higher expenditure for fuel for firing non-lead glazes. There is a strong demand for lead glazes now.

British brickmakers who have taken to using traction engines for drawing their productions over the roads are finding themselves saddled with demands from local authorities for "excessive" use of these roads. A man at Leicester has been assessed £100 on this plea for last year. There are evidences that clayworkers will unite, however, to fight this new extortion.

EASTBOURNE TECHNICAL INSTITUTE COMPETITION.

IN accordance with the recommendations of Professor T. Roger Smith, the assessor nominated by the president of the Royal Institute of British Architects, the Eastbourne Technical Instruction Committee have awarded the premiums offered for the best

front towards the apex of the ground and the approach from the railway.

The First Prize.

The assessor says: The buildings are three storeys high, and the architect has taken the trouble to show that the rear of his building will be presentable to persons coming towards the railway along the New Road. He has placed the fire-engine station quite distinct from the other buildings, which is, in my opinion, desirable, though many competitors have thought otherwise. It appears to me that the arrangement of the different departments is in each case good, and such as will be worked conveniently, and that they are well kept distinct. The separate entrances for male and female students are provided, and the lavatories are provided very cleverly by a mezzanine floor, which has given occasion to a very pretty feature of the elevation. The general treatment of the exterior is satisfactory. Exceedingly little has been done for the sake of ornament, but there is sufficient architectural character and a sufficiently varied outline to promise a suitable and pleasing exterior. I have carefully examined the design to see if it conforms with instructions, and I believe it does so fully. But I am afraid that this architect, like most of the competitors, has not given the class and other rooms in the science school as much height as the memorandum of the Education Department requires. I do not

TERMINALS AND CORBELS, BURFORD CHURCH, OXON. SKETCHED BY WILLIAM A. PITE. (See p. 359.)

competitive plans for a municipal technical institute, public library, fire station, &c., to be erected on the site at the corner of Grove Road and Water Lane, lately presented to the town by the Duke of Devonshire. There were twenty-one designs sent in, but the difficulties of providing adequate accommodation in an adaptable manner, together with the required facilities for lighting and ventilation in a set of buildings so complex and under the conditions imposed, were more than most of the competitors could satisfactorily overcome. This failure was especially noticeable in the distribution of space, the specified areas being in several instances varied. Professor Smith, however, set about his task by rejecting such designs as were extremely eccentric; such as had been planted the wrong way upon the site; others showing portions of the interior which would need to be artificially lighted in the daytime; and some weak designs obviously surpassed by others sent in. This process brought the number for selection down to five, and two of these were disqualified on the ground of cost, which would exceed the limit (£20,000) fixed by the Corporation by a sum little short, if at all, of £10,000. Of the remaining three the first prize was awarded for a design marked "F," representing a long block of buildings placed on the site so as to

find any room provided for a library in the art school, as the Department also requires. But there is no provision for this in the instructions. The classrooms do not communicate directly with each other, as the Department suggests, but to remedy that one or two doorways are all that is required. The author states the cubic contents of the institution at 491,840ft., and the cost of it at £18,450, and that of his fire station at £675. This is apparently worked out at 9d. per foot, a price which I have known to be sufficient for plain public buildings.

The Second and Third Prizes.

The second prize was awarded for a well-planned design marked "A," which does not adhere so closely to the instructions as design "F," but provides the accommodation required, though in some cases the dimensions of the rooms are modified. The science school is, in the opinion of Professor Smith, exceedingly well treated. The architectural chamber is satisfactory, while the general forms and the architectural detail would produce a picturesque and graceful exterior. The cubic contents of this building are stated at 654,608ft., which, with the bulk of it at 7d. but some at 4d., and with allowances of £1,650 for fittings and fences, gave a total of £19,932. The design marked "O" was recom-

mended to receive the third prize. "The general lines of the arrangement are suggested by the outlines of the ground. Throughout there is little lost space, but in a good many instances variations are introduced into the dimensions of rooms. Light has been carefully considered. The architectural treatment is picturesque and somewhat original, and the design is fairly economical. The author gives no particulars of his estimate, but expresses his conviction that the design can be executed in a satisfactory manner for the stipulated amount."

The prize-winners are:—First prize, Mr. Philip A. Robson, A.R.I.B.A., Palace Chambers, Westminster; 2nd, Mr. Henry A. Cheers, architect, Twickenham; 3rd, Mr. H. Drury, architect and surveyor, 2, Old Queen Street, Westminster, and Mr. W. C. F. Gillam, M.S.A., architect and surveyor, Central Chambers, 3, North Street Quadrant, Brighton, joint competitors.

Current Periodicals.

The Architectural Review (Boston, Mass.).—The leading article in the May issue of this magazine is by Mr. C. H. Blackall on "How to Study Buildings." This article is intended primarily for the information of young students desirous of becoming architects, and gives a number of useful hints upon the manner in which to approach actual examples of architecture for the purpose. The article, will certainly aid the beginner to seize upon the vital points of a building, and will probably prevent him from carrying away mere vague, general ideas which are often inaccurate and always unsatisfactory. Mr. Blackall's principles are briefly as follows: In studying a building consider firstly the mass; secondly, the disposition of the parts; thirdly, the scale; fourthly, proportions; and fifthly, the details. In considering the details, measure firstly the detail as mass, secondly for its fitness, and thirdly for its intrinsic qualities. A few words may be quoted from Mr. Blackall's article in extension of these headings:—"There are a few classes of buildings in which mass counts for but little, as in the design of a narrow street front or of any building which is only one in a block; but, generally speaking, mass is a very important consideration and the student can probably derive more good in less time by studying carefully the masses of the buildings which he investigates than by following any other one line. A good mass does not necessarily mean a good building any more than a poor mass necessarily means a poor building. . . . Especially is the mass not to be judged by questions of plan. . . . It is more in the distribution of parts, the breaking up of the whole, that the plan can to advantage count on the exterior of a building." Here are a few principles which, according to Mr. Blackall, should be considered in judging of the mass of a structure, and which seem essential to a successful design: "First, there must be some manifestly prominent idea, either a marked central feature or something which commands attention not for its detail, but for its paramount importance. . . . Second, there must be a unity of conception so that the design is treated as a whole, so that we feel that it is not pieced together, that it impresses us with the stamp of individuality and leaves no doubt in our minds of its being a completely conceived and completely finished structure. A building may in reality have been built in widely different periods, in different styles even, and with different materials, and yet be thoroughly consistent and coherent. So it is not a question of dates or of designers, but of result. Third, there must be a reasonable harmony between the purpose of the building and its general appearance. These three points, the preponderant idea, the unity of conception, and the harmony between use and design, are the points which one has to first consider in judging a building." . . . "After mass the next consideration is the sub-division of

parts." . . . "Scale and proportion are not the same, though the one is not often involved in the other. Scale in architectural design might almost be termed the exponent of a sense of fitness in the actual size of the parts, as related to each other, and to the design as a whole. In this is involved a certain indefinite quality by which is made manifest the real size of the building in feet and inches. . . . It is not so much the question of absolute size as of the feeling for proportion, and is not always a fixed measure.

Proportion is also a relative rather than an absolute quantity, depending very largely upon the character of the building."

"And, finally, there comes the question of detail. Detail must be considered in three ways. First, by its mass; second, by its fitness and co-relation to the design as a whole; and third, by its beauty or intrinsic worth. Detail in mass is always difficult to treat rightly. . . . The question of fitness of detail is one that has to do primarily with the character of the building, that is to say, the use for which it is intended, and, secondarily, with the material in which the details are executed." "There remains one other consideration which underlies and interweaves with all the foregoing, and which is absolutely essential to good architecture, and that is the question of beauty.

. . . It is a matter of temperament, which we define by pointing to examples rather than by citing rules or precedents, but it ought to be looked for first, last, and always in the study of foreign buildings. The beauty can appear in the mass, it may appeal to one in the disposition of parts, it should be made apparent in the proportions, and it simply must be present in the details." The article is concluded by a detailed criticism of the Palazzo Farnese, Rome; the Cathedral of Notre Dame, Paris; and the Library of St. Mark's, Venice, to show the method of applying the principles. The illustrations in this number are not particularly interesting; the Science Hall of the Christian College in China, at Canton, has the appearance of an engineering workshop, with decoration badly copied from the traditional forms of Chinese architecture.

The American Architect for May 26th contains an illustrated article on the Paris Exhibition. The illustrations are the most interesting of the contents. The designs for cottages at Port Sunlight, by Messrs. Wilson and Talbot, seem neat simple little residences well suited for their purpose. The new palace for H.M. the Emperor of China is an appalling attempt at Classic; to support a verandah at the centre of the columns of the front and sides, is but one of the atrocities in this design. The temple for the Indianapolis Hebrew Organisation is a bold and impressive building, and it seems a great pity that it should have been marred by the paltry detail; the front entrance is not at all suitable. The competitive design for the United States Custom House at New York by Mr. Francis H. Kimball is grandly impressive in mass, but does not suggest what it is meant for; it looks more like a national opera-house. The number for June 2nd is also deficient in the matter of articles. An illustration is given of the St. John's, Hampstead, Public Library (Mr. Arnold S. Taylor, architect). This building is on the right lines, but the ugly ventilators on the roof, and the spiked ornaments on the gables and entrance porch, spoil the skyline. The smooth stone dressings seem needless, and give a patchy appearance. The House at Lennox, Mass., in the American Colonial style, is spoilt by the porch. The design for the competitive design for the U.S. Custom House, New York, by Mr. George Martin Huss, is not very successful.

La Revue de l'Art Ancien et Moderne for June contains articles on the illustrated prayer-book of the Constable of Montmorency, now in the Condé Museum; Jean Van Eyck's portrait of his wife; and the exhibitions of the French School of Painting, of medals, of metalwork, and the historical exhibition of renaissance art at the Paris Exhibition.

Berliner Architekturwelt this month has articles on social foundations of civic building, and Berlin architecture and art-work at the Paris Exhibition. The illustrations of modern German works of architecture and crafts are of the usual distressing type, the only things at all commendable being two chairs designed by Herr A. Blunck and made by Herr Lion Kiessling. A coloured plate is given of an hotel at Schwarzbürg. This idea of this hotel seems to have been derived from our modern half-timber work—and that is bad enough—but this German design is copied without understanding, with no thorough appreciation, and without common sense. This design will perhaps show the folly of using half-timber with other materials, here being used with stone. In the attempt after picturesqueness, the architect has also jumbled the various parts up in a perfect medley.

The Architectural Review this month contains a number of interesting features. Mr. Halsey Ricardo contributes the first part of an article on the late Mr. Butterfield, illustrated by examples of his work at Rugby School Chapel (illustrated on the next page); All Saints', Margaret Street; and St. Albans, High Holborn. We cannot too highly commend the system started by this magazine of criticising certain recently erected buildings; this wholesome criticism is badly needed, and will, we believe, stir the profession to consider something beyond the mere commission, and to take greater care with their buildings; however much a man may strive to realise his ideals and do his best, the knowledge of other persons' views must assist him and encourage him. With this number a *critique* appears on the new town hall and municipal buildings at Chatham. Mr. H. J. L. J. Massé writes on "Men who Worked in Pewter." The second part of the article on the life and work of Robert Adam by Mr. Percy Fitzgerald is given, as also the second part of Mr. J. P. Cooper's article on the picturesque and interesting old town and castle of Annecy. Miss Ethel Wheeler writes on "Decorative Crafts in Poetry," a fascinating subject we do not remember having seen treated elsewhere. The examples of current architecture illustrated are of work by Mr. Mervyn E. Macartney, Messrs. Ernest George and Yeates, and Mr. A. C. Blomfield. The Boarders' House at Bradfield College, Berks, by the first-named architect, is a simple, severe, symmetrical building. We are inclined to think it is too symmetrical in its windows judging by the plan. A most necessary point for the judgment of the plan has been omitted—the compass point. The bell turret seems stuck on. There is an amusing criticism of the architectural designs at the Royal Academy Exhibition, which, although light, is extremely pertinent; Mr. Belcher's designs at the exhibition have suffered much criticism, and the following aptly and slyly hits the mark in regard to his design for the proposed Eastern Telegraph Company's building: "In Mr. Belcher's drawings, Nos. 1818 and 1821, we find many old friends in new environments; they proved useful in our studentship competitions of many years ago. The beautiful group carrying the sphere, in the observatory gardens at Paris, has helped many a lame dog over a stile! Jean Goujon's panels from the fountain also; but we hardly expected to find them worked in as part of a design by a member of the Royal Academy. Surely there are sculptors among that august assemblage. Mr. Belcher's symbolism is a little difficult to understand. What are the nymphs of the fountain, for instance, intended to represent; and the boys perilously balancing, or trying to balance, themselves on spheres; are they supposed to be the imps of the electric current, or what? If they were joined together by electric wires they might appeal more directly to the realism of the man in the street. It is a matter for congratulation that Mr. Belcher has kept clear of the heavy blocked columns of his Accountants' Building, which, by the way, seems to have attracted Mr. Colcutt. The shade of the heavy entablature over the third floor windows will surely darken the rooms under; presumably the dome will be

seen from below." A photogravure of a drawing of Booksellers' Row by Mr. F. L. Emanuel is given as a special plate. A number of notes on matters of interest and several reviews of books complete an excellent number.

Scribner's Magazine this month has an article on the paintings of John McLure Hamilton, written by Harrison S. Morris. Mr. Hamilton in his portraits has not merely produced a likeness pure and simple of the subjects of his works, but has sought his subjects amidst their own natural surroundings, thus giving us not only the man but his accessories—the expression of the sitter as it lies about him in inanimate things. In this way these portraits become enhanced in value, and will doubtless last longer than the mere works of copyism that are produced on every hand. Mr. Hamilton's portraits in showing the personality of the subject will be of historic value to future generations. The article is illustrated by reproductions of the portraits of Professor John Tyndall, Mr. Gladstone, Mr. G. F. Watts, R.A., and Mr. Henry J. Thouron. Mr. John La Farge contributes a particularly interesting article on colouring statuary and architecture, which should be read carefully by architects and others who have to do with decorating buildings. Mr. La Farge shows how false is the attitude still sometimes taken up that sculpture and architectural forms should not be painted. We have now generally realised that the Greeks used a large amount of colouring on their sculptures and their temples, and intercourse with Japan and India have brought home to us the knowledge of the great successes in this line there to be seen. The writer of the article draws attention to the principle that in this kind of work the colouring should not be fanciful bits of æstheticism, but vital factors in the impression produced. In temples where the light is usually dim and uncertain, but at the same time liable to sudden breaks of sunlight, this heightening of form by colour is most appropriate, and helps the statues, &c., to come into proper relation to their surroundings. "In all of the better instances that I remember," says the writer, "in Japan there was no intention, apparently, of matching the original represented. Lips were not painted red, as are the lips of the ladies who keep up their youth perforce. Teeth were not made bright white enamelled bits of bone, but were gilded just enough to glitter and look as part of the living organism. All of this, of course, is the recognition of life as but the object of representation and the means of embodying an idea, so that there is no notion of realism in these finishings in the sense of a competition with nature, but only an idea of keeping the work in the key of the place where it is, and preventing the suggestion of death and arrest of vital meaning. Were a white marble statue placed in any rich and coloured surroundings, the first impression would certainly be that of petrification. Only the genius of the artist would be able to triumph over the physical impression. And so, in the twilight of the Greek temple, the Greek who was reasonable and highly sensitive to artistic necessities, and also respectful of ideas, painted and gilded his statues, and filled their eyes with precious stones, and made their flesh of ivory and their clothes of gold, and painted the walls and the carvings, and did apparently the reverse of what we ourselves do. But he had what we have not any longer—the respect of the idea for which the work existed. He was vain of his success, as are artists, but it does not seem that he wished a success in contradiction to the meaning which he had intended to represent. Of course, his coloured statuary must have melted more into the surroundings and shown less of the particular cleverness of touch and modelling than it would have shown if uncoloured, and exhibited in the light of the Salon at Paris. But may it not be the reason of his superiority, which is generally acknowledged, that he was willing to subordinate his cleverness to his idea?" Mr. La Farge clearly shows that colour can be used, and should be used to insist—what the French would call *appuyer*—upon the meaning.

The Century Magazine this month contains an article on "Painting Racial Types," by Mr. Charles De Kay, illustrated by reproductions from paintings by Hubert Vos. A remarkable article is contributed by Mr. Nikola Tesla on "The Problem of Increasing Human Energy." Mr. Archibald Butt writes on some early Spanish arches at Tlalmanalco, Mexico; it appears that these were erected by Aztecs under the direction of Franciscan monks, and were intended for a Christain cathedral of mammoth proportions. Every stone indicates that it was elaborately carved by an Aztec, for nearly everyone contains either an Indian head or an Aztec idol; moreover, each stone in each archivolt is complete.

posal of Sewage," "The History and Development of Motor Cars," "Modern Methods of Saving Labour in Gasworks," and "Pneumatic Rock Drills." A description is given of Ljungstrom's Crankless engine, a highly ingenious invention that may revolutionise the application of steam power. Mr. L. Lodian gives particulars of a remarkable phenomenon he has observed on the Siberian Railway—the expansion of iron rails at 40deg. to 50deg. below zero; previous to this the only phenomenon observed has been a contraction during moderate cold of, say, 25deg. to 40deg. below zero centigrade. Professor Victor C. Alderson contributes a paper on "Technical Education—an Economic Necessity," and Mr. George H.

RUGBY SCHOOL CHAPEL. THE LATE WILLIAM BUTTERFIELD, ARCHITECT.

(From "The Architectural Review" for June.)

The columns are all clustered, and bosses at the beginning of the spandrels evidently indicate that there was to be a groined roof. The date of the beginning of the work was probably 1521 or 1522. Mr. John Morley contributes a further part of his article on Oliver Cromwell, illustrated by some beautiful drawings by Mr. F. Luis Mora, Mr. Joseph Pennell, Mr. S. J. Solomon, A.R.A., and Mr. Maurice Greiffenhagen. The illustrations in this magazine are remarkable specimens of the best work of modern mechanical engraving, and in many cases are greatly enhanced by handwork on the half-tone plates.

The Engineering Times for June gives the continuation of the articles on "The Dis-

Frith writes on "The Comparative Values of Belt-Pulleys." The Diagonal and Universal Wood-working machine is described and illustrated.

The Clayworker (Indianapolis) for May is a particularly good number of this magazine. Articles are given on terra-cotta in brick construction, fire brick, brick pavements, a new paving brick testing machine, exact testing instruments for clayworkers, brick building in Cuba, the building interests in Greater New York, defects of glazes, Boston baked brick, smoke consumption and economy of fuel, clay in modern building work. Many other notes of interest are included.

The Quarry has illustrated articles this

month on the geology of the plain of Caen, cranes and other lifting and transporting machinery and appliances, the soapstone of the Arabs, and the mineral industry of Yorkshire. Mr. Edward C. R. Marks, A.M.I.C.E., writes on aerial cableways, a means of transporting materials that should be much more largely adopted; the system need not be used only for quarrying and mining, and we are sure many builders and contractors could make economic use of it.

Architectural Association Notes for this month has a review of Mr. E. S. Prior's book on English Gothic architecture, and articles on the Royal Academy Exhibition; Mr. W. Howard Seth-Smith, the new president of the Association, this being illustrated with a portrait; and on "The Soirée."

The Journal of Decorative Art contains nothing of particular interest this month. A large number of short paragraphs are given, and articles on "Some Recent Decorations at the Mansion House, Dublin," "Brushes and their uses and abuses," the Royal Academy Exhibition, exhibits of the Midland Railway Company at the Paris Exhibition, and on Mr. R. W. Essex, of the well-known firm of wall-paper manufacturers. A number of sketches by Mr. J. B. Gass, F.R.I.B.A., are illustrated, and a coloured plate of colour schemes for decoration of drawing-rooms is given. Of this last we need only state that it is of the usual form of house decorative (?) work.

The Decorators' Gazette and Plumbers' Review has a large number of practical articles and notes of interest this month. Further instalments appear of the articles on "Sanitary Plumbing and Drainage in Town and Country," answers to examination questions in plumbers' work by the City and Guilds of London Institute, "Cast-iron House Drainage," "The Progress and Development of English Glassmaking," "House Sanitation with reference to Drainage, Plumbing, and Ventilation," "Practical Paint-grinding," "The Manufacture of Painters' Colours," and "Oil Lamps." An article is begun with this number on the mechanical resistance of glass, and complete articles appear on the Bohemian sheet glass workers; the Registration of Firms' Bill; stains, staining and varnish; the Registration of Plumbers' Bill; the painter as decorator; the influence of pigments on the permanence of paint; and lacquers and paints from petroleum waste. This trade magazine is of a very practical character—just what is required.

The Pall Mall Magazine this month keeps up its reputation for providing something above the usual popular magazine matter. With this number is given, in addition to much of general interest, a coloured drawing by Mr. A. S. Hartick; a poem by Mr. Ernest Rhys, illustrated by Mr. Maurice Greiffenhagen; the third part of an article on arts and crafts in the sixteenth century, illustrated by some rare old engravings after Stradanus; and an article on Claude Monet, impressionist, by Mr. Wynford Dewhurst, illustrated with reproductions of paintings by this eminent French artist, so little known in England. Mr. G. W. Forrest writes on "Delhi: Past and Present." The architectural works of India are wonderful, and it is strange that comparatively little attention is paid to them by architects in this country, as likewise with the architecture of Japan. We have almost lost the examples of Gothic work both in England and abroad by countless restorations, and an ever-increasing number of students devote their time to Greek and Roman examples. The consequence is we see on every hand, and seem likely to see a greater proportion of future, buildings built in the Classic styles, making our country truly a cemetery—a resting place for the dead. Now, if India and Japan were consistently studied students would gain some insight into the varied development of architecture in different countries through the various needs of those countries, the inhabitants and the influence of tradition, and we believe they would be led to forsake the paths of copyism to the enrichment of this country and to the making of

human interest in the buildings. It is with this idea we are glad to welcome anything which is likely to draw attention to the subject. Mr. Frederick Dolman contributes an illustrated article on "Shipbuilding on the Clyde," which is of more than merely popular interest.

The British Clayworker keeps up its usual standard of excellence this month in the way of practical articles. The chief articles are on the brick earths of Great Britain, brick burning by gas, brick drying, how to prevent clay-slips, and the utilisation of blast furnace slag. A useful suggestion is made in an article on paving brick tests; these tests are usually most unreliable and the suggestion is made that the test should consist of abrading with a rubber of a uniform weight, studded with hard minerals such as corundum, a slab, say a yard square, composed entirely of bricks, properly set. The rubber, covering several bricks on the slab, might then be moved to and fro by crank action at a definite rate, and for a definite time. The value of this suggestion will be appreciated by any surveyor that may have had occasion to seek for definite and uniform results of tests on paving bricks.

ERECTING ADJUNCTS TO BUILDINGS.

AN INTERESTING CASE.

THE recent case of *Shoemith v. Dodd and Co., Ltd.*, heard in the Court of Appeal, was a building scheme case, and the sole question was whether the plaintiff had by his conduct precluded himself from insisting that the restrictions under which the property was sold should be observed. The facts were as follows:—In 1871, certain land at Halifax was sold by auction in lots for building purposes. Among the conditions of sale was the following: "All buildings shall be erected in accordance with the building line shown upon the plan, and all buildings, stables, and conveniences shall be placed on the westerly side of the lot." The building line was 60ft. from the road, which lay on the east side of the lot. At the auction the plaintiff bought the two lots at the south end of the land, and the lots adjoining the north side of those bought by the plaintiff were unsold. The condition above set out was incorporated in the form of a covenant in the conveyance taken by the plaintiff. The plaintiff built on his lots a house in accordance with the conditions of sale, and afterwards leased it for seven years, the lease to be determinable at the option of the tenant at the end of five years. In November, 1897, the plaintiff gave permission to his tenant to build a billiard-room, which he was to be at liberty to remove at the end of the term. In the course of the same month the billiard-room was erected. It was 32ft. long by 26ft. wide and 17ft. 6in. high, and it stood 10ft. back from the road. It had brick foundations, upon which were laid sleepers embedded in mortar, and upon the sleepers were timbers, which were secured to the foundations by bolts. Then wooden sides were erected in sections, and the whole was covered with a corrugated iron roof. Before the issue of the writ in this action the building had been removed. In 1898 the lots adjoining the plaintiff's lots were again put up to auction, and the plaintiff stated that the lots were subject to a building line covenant. The defendants bought the lots and took a conveyance containing a covenant similar to that in the plaintiff's conveyance. The defendants then expressed their intention of building right up to the frontage of the road, and the plaintiff brought the present action for an injunction to restrain them from erecting any buildings in front of the building line. The defence was that the plaintiff's action in permitting the erection of the billiard-room had disentitled him from obtaining that form of relief. The learned commissioner came to the conclusion upon the evidence that the defendants bought with full knowledge both of the

existence of the billiard-room and of the restrictive covenant, and that the plaintiff had not precluded himself from asserting his right to enforce the covenant. He therefore granted an injunction. The defendants appealed. The court dismissed the appeal. The Master of the Rolls said that it was clear that the intention of this building scheme was that the houses to be erected should be in the nature of suburban villas, having gardens fronting the road. It was suggested on behalf of the appellants that, inasmuch as the billiard-room was a permanent structure erected in breach of the condition as to the building line, and was in existence at the time of the sale to the defendants, the plaintiff was for ever prevented from enforcing the condition, either because he could not be compelled to pull down the building or because by keeping up the building or pulling it down he had an option to insist upon the covenant's being either disregarded or enforced. His lordship was unable to accept either view. If this structure was to be regarded as a building which, so long as it stood, was a breach of the covenant, he thought that the purchasers in 1898 could have obtained an order to have it taken down; but he was not sure that even that was absolutely necessary for his judgment. The defendants proposed to build a house which was admittedly a breach of the building line, and it was part of their scheme to erect a number of semi-detached buildings close to the road. Thereupon the plaintiff obtained the removal of the billiard-room and commenced this action. He thought that the learned commissioner was perfectly right in saying that nothing had been done by the plaintiff which was inconsistent with the main object of the condition, and that if anything of that kind had been done the defendants could have obtained the removal of the building. His lordship could not conceive that a breach of the condition in the past, not in itself inconsistent with the general scheme under which this property was laid out, would of itself be sufficient to preclude the plaintiff from insisting upon his right to have the character of the property preserved in accordance with the scheme. It would be extremely wrong to allow a house of the character which had been erected by the defendants to remain on this property. He, therefore, thought that the injunction was properly granted, and that the appeal should be dismissed.

Lord Rigby concurred. In his opinion the question was not whether the nature of the building to be removed was such that it was a breach of the covenant, but whether the plaintiff had intended to put himself in such a position that he could at his own option insist upon the breach or the performance of the covenant. There was nothing to show that the tenant had ever claimed the right to retain the building where it stood until the end of the term. In his lordship's opinion, he always knew that when the property was developed he would have to pull down the building, and that he was quite willing to do. Lord Justice Collins also concurred.

Castle for Sale.—Castle Fraser, Aberdeenshire, originally known as Muchells, is for sale. It is a fine old building, regarded as the best example in the country of Flemish architecture. The various parts of the fabric date from 1454 down to 1818.

Reconstruction of the Royal Exchange Front, Edinburgh.—At a meeting of the Plans and Works Committee of the Edinburgh Town Council on Thursday last, the City Superintendent of Works submitted two designs for the reconstruction of the entrance to the Royal Exchange Square, one of which was approved provisionally. It shows a plan for closing the present three middle arches with ornamental railings, the remaining four to be opened up, the two outside arches being used for foot passengers, and the other two for carriages. The same committee recommended for acceptance estimates amounting to about £3,000 for alterations to John's Coffee House and the Council Chambers, recently authorised by the Town Council.

ARCHITECTURAL CONGRESS.

THE FIRST MEETING.

THERE was a large and distinguished audience at the Conduit Street rooms of the Royal Institute of British Architects, on Monday evening last, when the president, Mr. William Emerson, held a reception in connection with the Architectural Congress being held this week. Among those present were:—Sir Lawrence Alma-Tadema, Sir Henry Howarth, Mr. Edward W. Mountford, Mr. and Mrs. Arthur Cates, Mr. Aston Webb, Mr. E. A. Gruning, Mr. R. Phenè Spiers, Mr. J. M. Brydon, Mr. F. C. Penrose, Mr. and Mrs. Carøe, Mr. Leonard Stokes, Mr. Thomas Blashill (late superintending architect to the London County Council), Mr. Hugh Stannus, Mr. Hoynes Fox, Mr. H. L. Florence, Prof. Aitchison, Mr. Beresford Pite, Prof. Neckelmann (hon. corres. member of the Institute at Stuttgart), Mr. Batchelor (Dublin), Mr. Bartlett, Mr. Carby Hall (president of the Leeds and Yorkshire Architectural Society), Mr. Frank Lee (Manchester), and Mr. Charles King (president of the Devon and Exeter Architectural Society).

The Presentation.

The feature of the evening was the presentation of the Gold Medal which is yearly conferred by Her Majesty the Queen (on the advice of the Institute) on some distinguished architect, scientist, or man of letters whose work is considered to be of great value, and deserving of royal recognition. This year it has been conferred on Professor Rodolfo Lanciani, of Rome, but, as he was unable to be present to receive it, Count Carrobio of the Italian Embassy in London attended on his behalf. Whilst the president was proceeding with his address a telegram was received from the learned professor saying that he was present in the spirit, and offered the Institute his heart-felt thanks. Since 1848, when the first presentation of the Gold Medal was made, this honour has been conferred on men of many nationalities, but only once (in 1849) on an Italian—Signor Canina. The work which has been done by the professor is so extensive that it would only be wearying to recapitulate it. Rome, which has been the scene of the greater part of his labours, was also his birth-place. He was born on January 1st, 1848, and after graduating at the Collegio Romano and then at the University of Rome he assumed, in 1871, the post of assistant director of excavations in Rome; later on he became director, retaining that position until 1890. With this he also combined the Chair of Topography at Rome.

His efforts in the various buildings in and around the great old Roman capital—in the Sacra Via, the Forum, and the emperors' villas, for instance—have met with great success, and the resulting discoveries have added much to archaeological and antiquarian knowledge. Not only has Prof. Lanciani devoted his attention to what the earth had to give, but he has made numerous documentary discoveries (there have been about 25,000 hitherto unpublished documents found in connection with the excavations) and has visited most of the libraries of Europe.

His writings are also voluminous, for down to the end of last year no less than four hundred had been published. His first work was a catalogue of the Castellani Etruscan collection in the Capitol, for which he was awarded a gold medal, while for his work on aqueducts he was presented with the royal prize of 10,000 lire. The plans of Rome prepared by him are of great value. The Professor speaks English very well; his "Ancient Rome" was written in English. There is a book of his called "New Tales of Old Rome" now in the press, and it describes the excavations that have been, and are still being, carried out in the Sacra Via and the Forum. Prussia, Russia and Italy, and our own Universities have conferred honour on him, and there is no doubt that he is the greatest of Roman topographers, besides being a great archaeologist, and those

who have criticised him so severely have themselves acquired a large portion of their Roman knowledge from the Professor; so that he is a most worthy recipient of the Gold Medal.

After the presentation had been made a series of lantern slides of ancient Greek buildings (made from photographs taken by Mr. Ernest George Spiers, brother of Mr. R. Phenè Spiers, a beautiful collection of whose water-colour sketches of Grecian ruins were ranged round the room) were thrown on a screen, and described in a graphic and impressive manner by Mr. Penrose.

R.I.B.A.

Election of Council, etc.

The following elections have been made for the 1900-1 session of the Royal Institute of British Architects:—

President.—Mr. William Emerson.

Hon. Secretary.—Mr. Alexander Graham, F.S.A.

Vice-Presidents.—Messrs. J. Belcher, A.R.A.; J. McKean Brydon; E. A. Gruning; J. Slater, B.A. Lond.

Members of Council.—Messrs. F. T. Baggallay; Thomas Blashill; G. F. Bodley, A.R.A., F.S.A.; James Brooks; W. D. Carøe, M.A. Cantab., F.S.A.; T. E. Colcutt; W. Milner Fawcett, M.A. Cantab., F.S.A.—John Alfred Gotch, F.S.A. (Kettering); E. T. Hall; H. T. Hare; E. W. Mountford; Beresford Pite; G. H. Fellowes Prynn; R. Phenè Spiers, F.S.A.; H. Heathcote Statham; Leonard Stokes; Paul Waterhouse, M.A. Oxon.; Aston Webb, A.R.A., F.S.A.

Associate-Members of Council.—Messrs. R. Shekleton Balfour; A. S. Flower, M.A. Oxon., F.S.A.; J. S. Gibson; H. V. Lanchester.

Representatives of Allied Societies.—David Barclay, Glasgow Institute of Architects; Sir Thomas Drew, R.H.A., Royal Institute of Architects of Ireland; William Glover, Northern Architectural Association; W. Carby Hall, Leeds and Yorkshire Architectural Society; C. King, Devon and Exeter Architectural Society; F. H. Oldham, Manchester Society of Architects; S. P. Pick, Leicester and Leicestershire Society of Architects; J. Smith, Sheffield Society of Architects; F. W. Wills, Bristol Society of Architects.

Representative of the Architectural Association (London).—Mr. W. H. Seth-Smith.

Auditors.—Messrs. W. H. Nash, Fellow; and H. A. Satchell, Associate.

Standing Committees: Art Standing Committee.—Messrs. J. Macvicar Anderson, G. F. Bodley, A.R.A., F.S.A., James Brooks, J. McKean Brydon, W. D. Carøe, M.A., F.S.A., T. E. Colcutt, Ernest George, H. T. Hare, E. W. Mountford, R. S. Balfour, J. S. Gibson, H. V. Lanchester, A. N. Prentice, W. H. Romaine-Walker, J. W. Simpson, Alfred Waterhouse, R.A., LL.D.

Literature Standing Committee.—Messrs. J. Bilson, F.S.A., Alexander Graham, F.S.A., B. Ingelow, A. S. Flower, M.A. Oxon., F.S.A.; W. A. Pite, G. H. Fellowes Prynn, Sydney Smirke, R. Phenè Spiers, F.S.A., J. Humphreys Jones, B.A. Lond., A. N. Prentice, R. Elsey Smith, H. Heathcote Statham, C. H. Townsend, Paul Waterhouse, M.A. Oxon., L. Waterhouse, M.A. Cantab., P. S. Worthington, M.A. Oxon.

Practice Standing Committee.—T. Batterbury, S. Flint Clarkson, T. Harris, W. H. Atkin-Berry, C. H. Brodie, H. Hardwicke Langston, G. Hubbard, F.S.A.; A. H. Kersey, J. Douglass Mathews, W. Hilton Nash, Sydney Perks, A. W. Tanner, Beresford Pite, J. Osborne Smith, E. Woodthorpe, M.A. Oxon.; W. H. White.

Science Standing Committee.—Lewis Angell, M.Inst.C.E.; Thomas Blashill, F. R. Farrow, H. W. Pratt, S. B. Beale, H. W. Burrows, Max. Clarke, H. D. Searles-Wood, P. G. Smith, A. S. Snell, B. J. Dicksee, M. Garbutt, W. C. Street, B. Tabberer, K. D. Young, G. Pearson.

The Parish Church of Great Missenden, Bucks. has been renovated at a cost of about £4,000. It was built in the twelfth century, and is one of the finest churches in the diocese of Oxford.

CARDIFF CASTLE.

LORD BUTE'S EXCAVATIONS.

DURING the past two years workmen have been engaged in pulling down the mound on the north side of Cardiff Castle and constructing a massive wall on the site of the Roman foundations, and now three-quarters of the northern rampart have been laid bare. The discoveries made serve to throw a great deal of fresh light upon the condition of Cardiff Castle in days when Roman legions, eighteen centuries ago, paced the Via Maritima, which passed from Gloucester, via Caerleon, Cardiff, Cowbridge, Neath, and Loughor, to far St. David's. In the excavations Mr. John Ward, F.S.A., curator of the Cardiff Museum, has had a free hand, and the chief discovery of the past few weeks has been the bringing to light of the Roman North Gate of Cardiff Castle.

In the first place it may be as well to mention that in South Wales and Monmouthshire there are three fine examples of different stages of development in Roman castramentation. Mr. Ward, who has made a close study of them, classifies them in the following way:—(1) Gelligaer, an early simple quadrangular fortress, with rounded corners and four great gates; (2) Caerwent, a fortress of similar type, with later added-on bastions, thus indicating a development of military art subsequent to the first erection of the station; (3) Cardiff, which was obviously rebuilt during the bastion period, the bastions being of one work with the walls. But this camp (i.e., the camp of the bastion period) rests upon the foundations of a camp of the early type. In Mr. Ward's opinion it is not surprising, as Cardiff represents the stage in which the defensive character had been developed, to find that the gates were only two, north and south, and were, indeed, smaller than the recently opened double one at Gelligaer, although a larger camp than the latter (see page 347 of last week's issue). The newly-discovered gateway is typical of Roman work during what may be termed "the bastion period" of their castramentation. It is a single gateway, little more than half the size of that recently unearthed at Gelligaer. The gateposts themselves are composed of massive blocks of Dundry stone from Somersetshire about 15in. deep. No trace of the sill of the gateway is to be seen, but the large flat stones containing the round hole in which the pivot of the doors worked are still in position on the inner side of the gatepost. Inside the gatepost is the recess into which the doors, which, of course, opened inwards, fitted. At each side is a guard room, the outer wall being curved on the inside, but angular without, standing upon a circular foot or set-off, forming a bastion. Through the centre of the inner wall of each guard room are to be seen the remains of a doorway leading into the interior of the camp. The further progress of the excavation works will be watched with interest, as there will, no doubt, be many more discoveries forthcoming.

Improvements at the Guildhall.—It has been decided to spend £850 on the general repair, decoration, and furnishing of the committee rooms, law courts, and lobbies at the Guildhall. Also, at a cost of £270, to erect a permanent ladies' gallery at the north side of the Guildhall leading to the crypt.

King's Lynn.—Messrs. Macmillan and Bowes, of Cambridge, will shortly publish Mr. Beloe's works, "Our Borough" and "Our Churches," with an afterwork on the art of the Renaissance in King's Lynn. The first-named book will cost 21s. net, and the second 25s. net; the editions will be limited.

Bontnewydd Orphanage, Carnarvon.—The estimates for the proposed orphanage to be erected at Bontnewydd were recently considered by the committee, when the tender of Mr. Richard Jones, Llanwnda, was accepted. The architect is Mr. T. Taliesin Rees, F.R.I.B.A., of Birkenhead, whose plans were placed first by the assessor in an open competition.

FLUSHING WATER-CLOSETS.

THE QUESTION AT HULL.

AT the meeting of the Water and Gas Committee of the Hull City Council held last week, the chief business was the consideration of the engineer's report on the question of flushing water-closets. The report included observations by members of a deputation representing the National Association of Master Plumbers, remarks by the architects of Hull, information and statistics from other towns and cities, and finally the engineer's own observations. The last summed up may be as follows:—"It will be seen that a 2gal. flush is prescribed and fixed in many large towns, and even in those where a larger flush is permitted the return states '2gal. flush in general use.' With the best appliances mechanical means are sometimes necessary to keep the pan in a perfectly clean condition, but an unlimited quantity of water will not keep improper basins clean. With a view, however, to leave a margin of safety the flush was increased in the Hull by-laws to 2½gal. This has now been approved by the Local Government Board, who, as the Committee are aware, are very careful in their actions, and jealous of sanitary efficiency; and after careful re-consideration, I am strongly of opinion that a 2½gal. flush (actually 2gal. when ball-cock delivers during flush) is sufficient. I therefore recommend that the Committee make regulations as addenda to the by-laws, such regulations being for the guidance of builders and plumbers as the conditions to be observed in work in connection with either existing or proposed supplies. This will be following the practice in several other towns, and I would take this opportunity, in order to dispel the misapprehension which some members of the Committee have, of stating that both the by-laws and proposed regulations are based upon the experience of other water undertakings, as shown in their by-laws and regulations, and the requirements proposed for Hull do not exceed, and are in some respects less stringent than, those in many towns."

The chairman moved, and the deputy chairman seconded, the adoption of the report and its recommendations. The Mayor expressed the strong opinion that a 3gal. flush should be given. The bulk of evidence quoted by the engineer was by water engineers and water companies who were financially interested. The engineer said that to increase the flush would be to put a premium on badly-designed closets and badly-laid house drains. He had the greatest respect for the chairman and the engineer for their desire to conserve the water, but he thought there was something which was paramount to the saving of water, and that was the question of public health, and he was prepared to say, from his experience, that 2½gal. was not an effective flush; 3gal. was not at all too much to ask for. There was no town that had to be content with a flatter drainage than Hull, and it would be a great calamity if they restricted the amount of the flush to 2½gal. He was not giving his own opinion only, but that of every architect in the city, and he claimed that they should know what was necessary in that respect as well as the Waterworks Engineer. They had also the opinion of the medical men of Hull, and there would be a requisition from them to the Council if the 3gal. flush was not agreed to that day.

After further discussion Mr. Hanger moved, as an amendment, that the by-laws be amended to read, "and the flush shall not be less than two nor more than three gallons." This was agreed to.

Ruskin's Grave.—It has been decided to erect a runic cross over the grave of John Ruskin in Coniston Churchyard, and the work of designing it has been entrusted to his biographer, Mr. W. G. Collingwood, who has prepared a design which will allegorically illustrate the great author's works. The cross, which is to be executed by a local sculptor, will be in stone native of the district, this being the late Mr. Ruskin's wish.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Il faut pouvoir faire servir le trivial à l'expression du sublime; c'est là la vraie force.

Our Inset Sheets.

ISLE ABBOTTS, as it is now written, but which should be more correctly spelled Ile Abbotts (from the River Ile which flows close by), is a small village situated in the heart of the great plain of mid-Somerset. It lies about five miles to the north of Ilminster (the nearest railway station), and twelve miles east of Taunton. The church is dedicated to St. Mary the Virgin, and is remarkably fine. The tower is of the typical Perpendicular of the county, and possesses the additional merit of having all its niches complete with the original figures intact. The piscina is unusually large and curious in design. The sedilia is very beautiful and remarkable for being built in two very different kinds of stone. The upper portion above the necking of the columns is worked in a pure white stone (like the columns themselves), while the remainder (like the rest of the worked stone in the church) is of Ham Hill stone, the quarries of which are about a dozen miles to the eastward. The design of this sedilia has been reproduced in the modern church of Buckland St. Mary (near Chard), built 1853-1863 from designs by Benjamin Ferrey, gold medallist for 1870. Our drawings of the piscina and sedilia are by Mr. George J. Gillham, of Taunton.—Mr. Alexander M. McLellan is the designer of the eight lights illustrated. The titles are as follows:—Fig. 1, the last of the English landing in a boat; Fig. 2, on the pier at Calais, English party landing; Fig. 3, English nobles just landed mounting their horses to join in procession—Earl of Somerset in foreground; Fig. 4, Henry VIII., Sir Thomas More, the Earl of Arundel, and other English nobles; Fig. 5, Francis I., the Constable de Bourbon bearing the sword of State, other Bourbon princes and gentlemen in waiting; Fig. 6, the Queen of France with her mother and maids of honour surrounded by the Guard du Corps; Fig. 7, the Cardinal Archbishop of Paris with a Guard of Suisses. Before him are borne the relics of St. Genevieve carried by young nobles (the King's Chamberlain accompanies the relics) with an escort of the Guards du Corps; Fig. 8, the tail of the procession, the burghers of Ardres with their wives leaving the town to take part in the festivities. On the drawbridge stands a palmer with his scallop to collect alms. The windows were executed by Mr. George Wragge, of Wardry Works, Salford, Manchester, for the drawing-room of the Royal British Pavilion at the Paris Exhibition.

A Famous Greek Statue.

"THE HERA OF POLYCLEITUS" was dealt with by Professor Charles Waldstein at last Friday's meeting of the Hellenic Society. This famous statue came from the hand of the greatest artist of the day (for Phidias was dead) and was comparable with the ivory Zeus and the Athene of Phidias. The statue was placed in the Heraeum of Argos, which was built after fire had destroyed the old temple in 423 B.C. It was of gold and ivory, probably 22ft. high. By its side was a Hebe of later date. It was to be observed that the national evolution of Greek art was to rejuvenate its divinities, or to differentiate into a more youthful form some of the attributes of the original deity. Thus Hebe was a development in younger shape of Hera—Persephone of Demeter. Then, again, in the later ages Apollo and Dionysius, Artemis, and Aphrodite became younger under the sculptor's chisel. To return to the Hera—the Professor had been led to the conclusion, after four years' labour for the American Institute at Argos, that the bust in the British Museum which had been thought to be an Apollo or Dionysius was Polycleitan in character and represented Hera. It was no easy matter—and the most skilled might err—to distinguish the sex merely from the head,

while Overbeck thought it was impossible to identify the type with any extant work, though the Ludovisi and Farnese heads in Rome were at one time held to represent the Polycleitan ideal.

Ruskin Letters Wanted.

IN the event of a representative selection from the letters and diaries of the late John Ruskin being published, it is important that his literary executors should have knowledge of all available material. Certain collections of letters are, of course, already open to them; but a large number of letters must exist in various hands, and can be brought to their notice only by those who own them. They will be grateful, therefore, if any owners of letters will send them to Mr. George Allen, Ruskin House, 156, Charing Cross Road, W.C., to be inspected, and, if need be, copied, and may rest assured that any that are sent will be returned with no unnecessary delay. If the originals cannot be sent, carefully-made copies might be forwarded, and the sending of copies with the originals would ensure a still speedier return of the latter. Since the death of Mr. Ruskin there have been repeated applications by individuals for the necessary leave to publish single or small groups of his letters. But while the interest of a collection, characteristic and worthy of the writer, is clear, his literary executors cannot think that the scattered and indiscriminate publication of his correspondence is desirable, and they now hope that in place of applying for a permission, which cannot be generally granted, owners of letters will be content to assist the project above mentioned.

Birmingham's New Workmen's Dwellings.

THE newly-erected workmen's dwellings in Milk Street, Birmingham, came in for a great deal of criticism at a recent meeting of the Birmingham Trades' Council. The Housing Committee thought the houses were not in any way inviting as residences, as they are extremely squat in appearance, whilst there was an entire absence of anything approaching decoration. The balconies constructed to form the access to the upper storeys were a most unsuitable arrangement and would always be an eyesore, besides which they made it impossible for a ray of sunshine to penetrate more than a few feet into the living rooms. In the self-contained or through houses there was a good living room and one good bedroom, but the second bedroom could not take more than one small bed. Leaving out the cost of the land altogether, the average cost per room was £45 5s, or £10 5s. more per room than was paid by the Corporation for similar work in 1892. In the opinion of the Committee, the houses would only accommodate aged couples or young persons without families, or at any rate with not more than two children. Thus the object of the City Council to build houses for the poorest paid labourer with a family of even moderate size had been a failure so far as the present scheme was concerned. Mr. Thompson remarked that the balconies formed the ugliest structure that he had ever seen, and he hoped the experiment would never be repeated.

Decorating the Royal Exchange.

ONE by one the recesses of the arcading in the Royal Exchange are being filled with pictures, and when the work is completed the building will be greatly enhanced. As yet none of the younger Academicians have taken up the note of decoration struck by the late President; Lord Leighton's picture of the "Phoenicians Trading with the Early Britons on the Coast of Cornwall" remains in all respects the first of the series. The panel painted by Mr. Ernest Crofts, R.A., for the Mercers' Company represents the opening of the first Royal Exchange by Elizabeth, while the panel painted by Mr. Stanhope Forbes, A.R.A., for the Sun Fire Office, representing (appropriately) the Great Fire of London, is treated in quite a modern spirit, contrasting with the pictures preceding it, and especially with that of Mr. S. J. Solomon,

A.R.A., next to it, which by comparison seems a more distant sort of art—as in some sense it is. It would be interesting to know what the painters themselves think of their work at the Exchange now that it is done—whether they are satisfied with it, or whether they have come to the conclusion that it is one thing to paint an easel picture up to the standard of the Academy and another to aspire to decoration. To the critic it is clear that the painting of most admirable *genre* does not prepare a man to decorate a public building.

French Decorative Work.

AN article by Mr. Lewis F. Day, the well-known art critic, particularly in connection with handicrafts and decorative

work, appeared recently in the columns of the "Manchester Guardian" on the decorative art at the Paris Exhibition. In the author's opinion by far the most imposing entrance is from the Champs Elysées. As you pass between the two permanent Palaces of Art, the façades of which have at least some architectural dignity, you see beyond the Bridge of Alexander III., the distant dome of the Invalides and the new Exhibition buildings designed to connect the two. The scheme is well planned, but the glaring white pinnacles decline to be dominated by the great grey dome, and what the eye sees is a restless up-rearing of flamboyant architectural detail: for the arts of peace are housed in plaster. There would be nothing to say against that if it had been used with reticence, but that is not a national characteristic, and the material is frightfully abused. It has never occurred to the architects to use it in a constructional manner, in frank combination, that is to say, with timber work or iron framing. They use it (rightly enough for temporary purposes) as a sort of scene-painting in the solid.

Some Examples.

You see that, for example, in Old Paris; but in the official buildings, both at the Invalides and at the Champ de Mars, the architect falls between the two stools of honest construction and well-sustained simulation. There is here in the façades such flaunting of detail as could not well be stone; the palatial effect is accordingly lost; one is reminded only of the frame-maker and of the plaster-image vendor. Still, the images are most skilfully done, and some of the buildings are further adorned with mural paintings of extraordinary skill. In fact, there are everywhere feats of accomplishment to which English decorators would not, under the circumstances, be anything like equal. We may criticise their work as not being according to our taste, but we could not have done it.

Bristol's Old Houses.

THE secretary of the Society for the Protection of Ancient Buildings has addressed a letter to the Town Clerk of Bristol with reference to certain old houses in King Street. The communication is as follows: "Sir,—The Society for the Protection of Ancient Buildings desires to approach the Town Council of Bristol upon the subject of the old houses remaining in King Street in your city. The Society understands that the Corporation is offering the site of these houses for sale, and therefore it desires to point out that this block of buildings is an object of great beauty, as well as being an important historical monument, showing the skill and beauty with which the men of Bristol built in days gone by. The Society is aware that Bristol has in recent years lost much of its antiquity, and therefore it wishes to call special attention to this block of buildings, and to respectfully ask whether the city cannot afford to allow them to remain? The Society realises that at present the buildings are in a bad state of repair. If they were built of brick or stone this would be a serious matter, but as they are constructed of timber there is no difficulty whatever in repairing and strengthening them. This being so, it is thought that the Corporation may be fairly urged to consider this course, in the belief that by so doing the Corporation would be best considering the interest and welfare of the city."

SCREEN, KING'S COLLEGE, CAMBRIDGE. DRAWN BY J. A. WOORE.

A.A. VISITS.

THE DEEPDENE, DORKING.

THIS celebrated estate and mansion at Dorking might very fitly be described from many various points of observation. In every direction there is such a vast quantity of good things, selected with an exceedingly fine taste and rare judgment, that they can appeal successfully to many tastes and pursuits, and at the same time give great pleasure to any visitor.

On Saturday last, June 16th, the first of the Summer Visits of the Architectural Association took place, when a large number of members—by the kind courtesy of the Duchess of Marlborough and Lord William Beresford, the tenants of the estate—were permitted not only to enjoy the beauty of the grounds, but to thoroughly inspect the magnificent contents of the mansion.

Dipden, or Deepdene, is a derivation from two Saxon words signifying a deep vale, and the name very significantly describes the configuration of the estate; owing to its very undulating nature the approach to the mansion and its surroundings are rendered very picturesque by immense masses of old trees: firs, beeches, elms, and oaks; these, with their June tints of green, form a strong background to the enormous masses of gigantic rhododendrons, now in full bloom, that must cover some hundreds of acres of hillside and valley. In whatever direction in any part one may chance to look, there are to be seen tremendous masses of these gorgeous plants, the usual deep mauve, a beautiful rich, semi-vermillion type, and the very rare white ones. In the midst of this wonderful setting is to be seen the great mansion, a building in dull greys and yellowish browns.

The first definite record that we have of the estate as a place of residence is to be found in Evelyn's Diary. "In 1655," he says, "I went to Dorking to see Mr. Chas. Howard's amphitheatre garden on the solitary recess, being 15 acres, environed by a hill. He shewed us divers rare plants, caves, and an elaboratory." We saw the cave on Saturday, a very curious grotto-like place, closed by an iron-barred gate. The interior seemed to be vaulted, and to contain as lumber a number of statues. Outside by the gate was a monumental tablet, setting forth, in the style of the eighteenth century, the merits of Mr. Charles Howard, who died in 1713. He inherited the estate from his father, the seventh Earl of Arundel, the estates having belonged to the Howards for many centuries. In addition there is the Great Cave; that, we were informed, contains statues to the value of £60,000, but we were unable to see them at the time.

Between 1777 and 1790 the house, as we can now only partially see it, was built around the older mansion by the tenth Duke of Norfolk; his son, the eleventh duke, sold it and the estate to Sir William Burrell, by whose son it was sold in 1805 to the celebrated Mr. Henry Thomas Hope; he, keeping the mansion as it stood, immediately commenced to enlarge it, and employed an architect named Atkinson to make the additions upon a large scale. This having been done, Mr. Hope, not being satisfied with the amount of space now at his disposal, or possibly with the architectural effect of the interior, became his own architect, and designed the enormous block that forms the present entrance front, containing the great hall and staircase, the billiard-room, the library, the Etruscan vase room, and a number of other apartments.

The entrance hall, approached by a very poor entrance and passage, is an immense square apartment running up through the building to the roof, and suggests that its *motif* is to be found in the courtyards that one may see in Roman and Florentine palaces; its treatment internally consists of two stages of orders, the lower one arcaded, and the upper one consisting of yellow Scagliola pillars with gilded caps, supporting a frieze and cornice, and a marble balustrading, forming on both floors a wide gallery, or loggia, on each

side; in the lantern stage is a smaller gallery.

The grand staircase leads from either side to the first floor. The details and decoration everywhere are very refined, but the general design, although the effect is very sumptuous, shows very clearly the hand of the amateur designer; it is in the cold manner of the lame classicism of the beginning of the century, pre-early Victorian, in fact, and the effect of the whole, despite its refinements, is only saved from the high-class mediocrity of the style by the very able and grand disposition of its magnificent paintings, &c., antique collections and gorgeous furniture. In fact, the whole interior is quite reminiscent of a grand storehouse of artistic objects, intermingled with which are the elegant things of to-day, that give to the whole place a touch of homeliness and comfort. The Etruscan room contains a magnificent collection of Etruscan vases of the best periods, arranged upon shelves and inclosed in glazed cases of a great height. The vases are of the usual familiar shapes and dull brownish red colours, with figures in black and white, and about the room are a vast number of rare Greek objects. In the adjoining chamber, decorated in a Pompeian manner, is a chryselephantine statue of Minerva, of large size, in white marble, attributed to Phidias, but from the disposition of its drapery, very suggestive of a Roman copy of a Greek statue; the treatment of the eyes, in some material like two varieties of white and dark green onyx, is very remarkable. There are also in this apartment many small Greek antique objects of very great interest.

The billiard room contains nothing of any particular architectural importance; it is, however, worth inspection owing to its magnificent marine paintings by Van de Velde, also a number of very fine Italian pictures. One of Martin's extraordinary compositions of architectural forms, tremendous skies, and terrified masses of people, attracted some attention; it is full of delicate colour, but, like his "Fall of Babylon," becomes slightly wearisome. A view of St. Alban's Abbey, as seen apparently from the old George Inn, and undoubtedly by David Cox, was much admired. A comparatively small room hung with exquisite old green silk brocade, and with a cornice quite 2ft. in depth, gilded in light gold, made a sumptuous and refined apartment, with paintings by Romney, Reynolds, and other early masters. The great drawing-room, a cleverly planned apartment, with its walls hung with old white silk brocade, and delicately painted ceiling, and furniture chiefly in white silk, embroidered in crimson, and with rich points of deep colour made by cushions, books, silver articles, etc., was very striking.

The saloon is a very large lofty apartment, with an elaborately coved and highly decorated ceiling. The general effect, however, is dull, heavy, and gorgeous. Here hang enormous masterpieces of the great Italian painters, Raffaele, Tintoretto, Giuliano, Paolo Veronese, and many others, but they are not seen to advantage. The Raffaele is remarkable, as its style, more akin to the work of earlier Italian artists, is utterly unlike the calm, stately dignity that one usually associates with this master's work. We noted the grand architectural effect produced by the use of lining a wall on the staircase with an entire mirror, in its way reminiscent of the effects seen on the grand staircase of the Paris Opera House. Descending to the hall again we examined many interesting antiquities, among which may be mentioned an exquisite white marble Greek sarcophagus, ornamented with the finest sculpture; another object, acting as a stand for a huge palm, is a most interesting and very large mediæval font, probably Italian, in a grey stone standing upon four carved legs.

Here we sat for some time, and then, possibly for the first time, having inspected a mansion built in a style that is supposed usually not to command admiration, and found that we could admire it for itself, and for its wonderful treasures—we passed out to enjoy the exceeding beauty of the park, and then back to London.

H. D. W.

COMPETITIONS AGAIN.

SOME time ago the Carlisle School Board announced its intention of receiving competitive designs for a new higher grade school to be erected in the city. "Instructions to architects" were issued in the usual way, and the competition was confined to Carlisle architects. The date fixed for receiving designs was March 12th, and after complete and mature deliberation the Board have announced the result of the competition. The premiums have been awarded as follows:—1st, Mr. Henry Higginson; 2nd, Mr. George Armstrong; 3rd, Messrs. Johnstone Brothers; 4th, Messrs. Oliver and Dodgshun. To assist them in coming to a decision they called in (at a fee of fifty guineas) Mr. Millar Reade, architect to the Liverpool School Board, who was instructed to select the four best designs, but not to place them in order of merit. This Mr. Reade did and prepared his report, a copy of which was sent to each member of the Board, with the intimation that its contents were to be regarded as strictly private. It now appears that the Board in its superior wisdom has entirely disregarded the assessor's recommendations and made its own selection. They further decline to produce the report, and hence have naturally aroused a good deal of indignation amongst the competitors. It is, of course, in every way commendable that a Board should pay fifty guineas to have the opinion of an assessor in an architectural competition and then disregard his recommendation altogether.

The Carlisle School Board indeed deserves a pat on the back—rather a hard one.

Enquiries Answered.

Testing Materials.

HARROGATE.—STUDENT writes: "Please name a firm who undertake to test samples of stone, both for strength and durability, and give the chemical constituents."

MESSRS. David Kirkaldy and Son, testing and experimenting works, 99, Southwark Street, London, S.E., will do what you require.

Architectural Assistants for South Africa.

WOLVERHAMPTON.—S. A. writes: "I should be glad if you could advise me as to the best means of obtaining a situation as an architect's assistant in South Africa."

We have had several enquiries on this subject from correspondents who seem eager to participate in the work of rebuilding and extension that must necessarily take place in South Africa. We would not advise haste, but the reverse. An article on building practice in Johannesburg appeared in our issue for March 7th last, and in the issues for March 21st and April 11th will be found further information on the subject. We cannot do better than refer our correspondent to these particulars.

Books on Plumbing.

PLYMOUTH.—STUDENT writes: "I should feel obliged if you would tell me the names and publishers of some text-books on plumbing, suitable for an apprentice."

"The Plumber and Sanitary Houses," by S. Stevens Hellyer, price 10s. 6d.; "Principles and Practice of Plumbing," by S. Stevens Hellyer, price 4s.; "Plumbing Practice: a Text-book for Plumbers," by J. Wright Clarke, price 6s.; "Plumbing," a text-book on the practice of the art of the plumber, by W. P. Buchan, R.P., price 3s.; "Lectures to Plumbers," by J. Wright Clarke, price 8s. The foregoing books are obtainable from Mr. B. T. Batsford, 94, High Holborn, W.C.

Professional Practice.

Baldovan, Dundee.—The foundation-stone of the new Asylum for Imbecile Children at Baldovan was laid on Wednesday last. Mr. J. T. Maclaren, of Dundee, is the architect. The site is free and airy, and the view obtained from the front is one of the best in the district, embracing all the lovely strath in which Downfield is so pleasantly situated. The buildings themselves will extend over about eleven acres, although at the present time it is only intended to complete the central portion, the outer pavilions to be added as occasion requires and finance allows. Accommodation for 200 children will be provided, which is a big advance on the possibilities of the existing institution. The various pavilions will be connected with each other by means of covered corridors. The first part to be undertaken will be the administrative section (the cost will be £10,000). It will contain the official's apartments, will accommodate twenty-four private patients, and provide hospital accommodation for twenty helpless children. The commissariat block is situated in the rear, and includes a dining room 71ft. by 32ft. and a separate dining room for private patients. The whole of the buildings will be heated by warm-air stoves and a low-pressure hot-water system. Electric light will be the illuminant. The cost of the work will be £25,000.

Bristol.—A new congregational church is to be erected on a site in Napier Road. Mr. George H. Oatley, F.R.I.B.A., is the architect. The building will comprise a nave and aisles, the arcading being of timber construction. The nave has an apsidal termination at the east end for the choir and organ, and there is a gallery at the back approached by a staircase in the low tower at the north-west corner. The upper storey of the tower is to form a classroom. The chapel is to seat 500 persons, and the church parlour, which is provided in the rear of the building, is to be hexagonal on plan, and will seat about one hundred. The style is fourteenth century English Gothic freely treated. It is proposed to use local stone with Bath stone dressings, the walls being lined internally with buff bricks. The roof is to be of open timber covered with Broseley tiles. The warming will be by a combined system of fresh warm air and hot water.

Colchester.—The school buildings erected in the grounds of the Eastern Counties' Asylum, Colchester, were formally opened on Thursday by the Marquis of Bristol. The schools and shops have been erected on the west side of the institution, and have been built and furnished entirely at the expense of Mr. Alexander Peckover, the Lord Lieutenant of Cambridgeshire, who has also built the connecting corridor and gateway, the total cost being £6,000. The block is 80ft. in length and 40ft. wide, and is built in white brick, to match the older part of the institution. There are two storeys, with a corridor running through the centre of each, and rooms on each side. These rooms are to be used as follows:—On the ground floor, tailor's, shoemaker's, carpenter's, matmaker's, and brushmaker's shops. On the first floor there are two classrooms for girls, three for boys, a wood-carving room, and a basket-making shop. There are lavatories at each end. The flooring of the corridors and lavatories is of Terrazzo pavement, and of the rooms wood blocks on concrete. The classrooms are divided by sliding partitions, on ball bearings. The top storey has been fitted up for storing articles used in the shops. The building is heated throughout by hot water, by means of a Keith's Challenge boiler in the basement, which supplies radiators in all the rooms. Lighting is by electricity, and ventilation by one of Blackman's fans, special ducts with openings from all the rooms being provided under each corridor, into which the vitiated air is drawn. The plans of the building were prepared by Messrs. Chancellor and Son, the honorary

architects to the asylum, and have evidently been arranged with great thought. The contractor for the building was Mr. Fred. Bennett, of Ipswich; for the heating, Messrs. Beckett, of Chelmsford; and for the electric lighting, Messrs. Christy Brothers and Middleton, of Chelmsford. Mr. F. J. Bugg acted as clerk of the works.

Conway.—The designs for interiors at "Nant-y-Coed," Conway, on this and the following page, are by Mr. Herbert Ogden, A.R.I.B.A. The work is painted ivory white, and has been carried out by Mr. William W. Freeman, of Chester.

Glasgow.—The new fever hospital erected by the Corporation at Ruchill has cost more than £250,000. The hospital includes thirty-four distinct blocks of buildings, the principal of which are sixteen pavilions for the reception of patients. Twelve of these are large pavilions, each having beds for thirty patients, or 360 in all; while the four smaller pavilions will each accommodate twenty patients, or eighty altogether. There is thus provided accommodation for 440 patients, allowing about 2,000 cubic feet to each bed. Much consideration has been given to the design and general arrangements of these pavilions, particularly in regard to ventilation and sanitation, and the systems adopted have met with general approval from those specialists who have had the opportunity of examining them. The experience gained in the earlier construction of Belvedere Hospital

has been invaluable, and all the features susceptible of improvement in that institution have been carefully investigated. Second in interest to the pavilions is the administrative block, a large building three storeys in height with a frontage of 240ft., the wing walls extending to 189ft. Bedrooms are here provided for 200 nurses, and ample provision has been made for the medical superintendent and the matron, as well as for the professional staff. Lavatories and bathrooms are arranged on a most complete scale. There is a large recreation room, sitting-rooms are provided for use during leisure hours, and four large sick rooms are available in the event of non-infectious illness occurring among the nurses. Fronting Bilsland Drive is the inquiry room. A large Dorcas store has been provided in the basement of this building, and the upper floors contain the recreation room, bedrooms for the male employees, a workshop, and telephone room. On either side of the inquiry block are the morgue and clearing-house blocks, the former being equipped with all the necessary appliances of laboratory, museum, lecture hall, post-mortem room, and funeral apartment; while the clearing-house has six separate bathrooms for males and females, with waiting and retiring rooms. The fire-engine station is placed in the middle of the clearing-house building, this position being the most convenient and central for the protection of the hospital. At the eastern extremity of the site are the wash-house, the laundry, the boiler sheds, the pump for raising the water supply into the tower, various workshops and

stables. In this position a railway siding affords the means of bringing in fuel and other supplies. On the south of the inquiry block, in the centre of the hospital, flanked on either side with pavilions, are placed the kitchen and stores block, the water tower, and the day workers' block. Besides the main kitchen, which will provide the food for the whole establishment, the building contains on the same level dining halls, stores, dairy, dispensary, and offices for the clerk of works and the house steward. On the upper floor there is store accommodation for the matron, and a sewing-room, bedrooms, and lavatory are also on this level. The water tower provides storage on four different levels, the upper tanks supplying the flushing cisterns in the administrative block. The day workers' block contains seventy-eight bedrooms, as well as a recreation room, napery stores, baths, lavatories, and other accommodation on a liberal scale. On either side of the entrance gateway in Bilsland Drive are houses intended for the house steward, the clerk of works, and other non-professional officers of the hospital. The lighting of the whole establishment is by electricity. All the buildings will be regulated in temperature by the circulation of hot water, although open fires are provided in the pavilions and in certain of the dormitories. The style adopted is a free treatment of Elizabethan architecture. The administrative block, the gate-house, and the cottages in Bilsland Drive are built of Dumfriesshire freestone. The pavilions, the tower, the

kitchens, and the other erections are built with a combination of Scottish terra-cotta, brickwork and freestone facings, the colouring giving warmth of tone and enhancing the general aspect of the buildings. Mr. A. B. M'Donald, city engineer, was the architect.

Holywell, Flints.—On Thursday last the foundation-stone was laid of a new wing to the Franciscan Capuchin Monastery of St. David at Pantasaph, Holywell, the addition being intended for the accommodation of novitiates. The new building, like the main building of the monastery, will be in the fifteenth century Perpendicular style of architecture. It will be 112ft. long, 34ft. wide, and 54ft. high. The walls will be built of local limestone, with Talacre stone dressings. One corridor will run the length of the building, and will be so constructed as to be a continuation of the corridor in the existing main building, thus giving one corridor 220ft. long. On the ground floor will be the community room, library, workroom, storeroom, and offices. On the first floor there will be twelve cells, built according to the latest sanitary improvements; the second floor will contain seventeen cells. The total cost will be about £7,000. The architect is Mr. T. Richmond Donneley, of Coventry, and the builders are Messrs. Foster and Dicksee, Rugby, who hope to complete the work within eighteen months.

Nottingham.—The new church of St. Bartholomew at Blue Bell Hill, now in course of erection, was designed by the late Mr. J. L.

Pearson, R.A., and is being carried out under the supervision of his son, Mr. F. L. Pearson, Mr. J. Hutchinson, of Gordon Road, Nottingham, being the contractor. The building will be of a simple character, in the thirteenth century style, and will consist of a nave of four bays 70ft. by 26ft., with side aisles each 10ft. wide, a chancel 40ft. by 20ft., a quasi-transept on the north side of the chancel with organ chamber over it and vestries to the east, a chapel 36ft. by 16ft. on the south of the chancel, and a south porch: it is proposed to add a tower in a corresponding position on the north side. The principal entrances are by a western door and the south porch. The west end stands up boldly with massive buttresses and three single lancets high up in the gable, whilst the aisles have coupled lancets in each bay. The nave arcades are comparatively low with a lofty clerestory over, lighted by tall lancets. The chancel is somewhat less in height than the nave, but is of the same general character; three lofty lancets which pierce the east gable are its most striking feature. The chapel, which is of smaller proportions, has an apsidal termination, and is lighted by a series of triplets. The walls will be faced externally with stone, with dressings of Bath stone. The roofs will be of Baltic timber, and will be framed with trussed rafters, with curved pieces, and tie beams to the nave roof only. The walls inside will be plastered. The church will be seated with chairs, and when completed will accommodate 650 worshippers.

New Patents.

These patents are open to opposition until July 24th.

1899.—Edging for Paths.—10,588. E. W. HILL, 69, Bartholomew Close, London, E.C. At short distances apart iron stakes are driven into the ground. Each of these has a projecting piece to support the board which forms the edging to the path. The edging can thus be renewed or repaired with ease.

Gas Burners.—10,616. H. W., and I. DARBY and J. H. PUNCHARD, all of 249, Pentonville Road, King's Cross, London, W.C., and W. C. PUNCHARD, 151, Cannon Street, E.C. The light given from this burner has a similar appearance to the incandescent gas light, but no Bunsen burner and no mantle are used. The effect is produced by the combination with an Argand burner of a hood, a button spreader, and a restrictor; these devices deflect the flame and heat the air with the result mentioned.

Metallic Lathing.—10,664. M. HILTON, Mossell Street, Cheetham, near Manchester. The object of this invention is the utilisation for building purposes of the scrap or blanks produced in the manufacture of bicycle chains, or in the gun, pistol, sewing machine, or similar trades. The perforated strips are fixed to the joists with nails or staples, and are then plastered over to the required thickness.

Bricks.—10,671. W. W. PILKINGTON, The Hazles, Prescott, and W. E. ORMANDY, 124, Windlesham, St. Helens. According to this invention, bricks are made from the sand and other materials that have been used to grind plate glass. The mixture is pressed into moulds, and is then heated until the glass slightly fritt and causes the grains of sand to unite. When cooled, a tough annealed brick is obtained. If a very dense brick is required, clay, chalk, or spent lime is added.

Conduits.—13,257. M. H. SMITH, Albany Buildings, 47, Victoria Street, Westminster, S.W. This invention is an improvement on that described in patent No. 5,025 of 1894. It consists in forming beneath the electric tramway route a culvert containing the service truck and the gas, sewer, and other pipes and wires.

Pipe Joints.—14,571. S. JENNINGS, Palace Wharf, Stangate, Lambeth, S.W. This invention relates to joints in which the ends of

two adjacent pipes are surrounded by a coupling made in halves. This coupling is pierced with holes which become filled with the cementing material and also afford an outlet for air or surplus liquid.

Flap Valves for Sewers.—14,869. G. S. MORGAN, Llantrisant Road, Pontyclun, Glamorgan; and W. WILLIAMS, Bryn-Derw, Plymouth Road, Penarth. Instead of making the flap rigid, it consists of about three parts hinged together so that the second does not open till the sewage has reached a certain level, and similarly with the third. The escape of sewer gas is thus controlled.

Braces.—15,425. W. H. C. HARRISON, Torrens Road, Woodville, South Australia. This is an improvement on patent No. 1,562 of 1899. A rotatable tool-holder or sleeve is mounted on the lower arm of the brace, and the tool required has only to be turned on its hinge and fixed in the socket in order to be ready for use.

Asphalt Paving.—16,827. H. D. BLAKE, 6, Mount Adon Park, Lordship Lane, London, S.E. The composition (which consists of natural mineral bitumen, 15 parts; fine sand or limestone powder, 65 parts; and mineral rock asphalt powder, 20 parts) may be used in three different ways—as a compressed, a mastic, or a block bituminous asphaltic pavement. In the first case the mixture is heated to a semi-plastic state, laid down, and rolled until cold. In the second case it is made up into blocks weighing about 56lbs. each, which, when cold, are broken up, re-melted, and laid in a liquid state on concrete foundations. And in the third case it is made into paving blocks, having a groove around them to form a key for the fixing material.

1900.—Saw-Sharpener.—2,875. P. LORD, 11, Uxbridge Street, Worcester, Mass., U.S.A. For sharpening a saw a file is used which has a certain number of ribs with a pitch corresponding to that of the saw teeth. This facilitates and quickens the operation.

Earth-Closets.—5,700. M. J. ADAMS, Park Lane Sanitary Works, Leeds. The object of this invention is to produce a very simple form of earth-closet which shall be self-contained. The body of the closet is practically an enlarged bucket, and is preferably made of sheet-iron. The seat may be made removable. At the back end of the body the earth-box is hung on pivots, to one of which a handle is attached. If the handle is raised rather quickly the earth or other deodoriser will be shot out of the opening at the front of the box.

The following specifications were published on Saturday last, and are open to opposition until July 30th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—8,408, HALDEJAER, machine for production of sanitary tubes. 10,904, SCHULTHESS, process for the production of compressed artificial sandstones. 11,256, AYOTTE and CHARBONNEAU, machines for the manufacture of bricks. 12,242, OTT, manufacture of metallic dust or bronze powder. 13,053, SANDERS, anti-vibrating springs for incandescent lamps. 13,054, SANDERS, holders for globes and shades of gas and electric lamps. 13,665, HEYDEN, process for producing artificial marble. 13,996, VERITYS, LTD., and RIDINGS, electric arc lamps. 14,325, BROOKER, machinery for rolling metal forms. 14,941, HOWARD-SMITH, rail joints of tramway permanent ways and securing rails to underbed. 15,026, COCHRANE, cement. 15,119, GRAUTOFF and FRITZ, burners for gas lighting by incandescence. 15,132, POTTER, manufacture of cement. 15,405, MCKINNON, windows. 16,006, GETTING (Olivero), flushing cisterns. 16,781, ZSIGMONDY, enamels or colours for earthenware and glass. 17,471, ADAMS, continuous burning kilns for bricks. 20,377, BEECH, construction and formation of building bricks. 21,372, MAYER, furnaces for heating and melting metals. 23,987, GAEFKE, plumbing, levelling, and angle-measuring instrument for use in building. 24,733, HUGHES, blind roller action.

24,946, STOBBS and THOMPSON, combined road cleaner, elevator, and dirt cart.

1900.—2,876, MORGAN and TAYLOR, overhead travelling cranes. 5,790, BARRON, air pumps and smoke-generating machines for testing drains and general sanitary fixtures. 5,885, GARCHY, manufacture of ceramic stone. 6,191, McLENNAN, agitating tanks for mixed paints. 6,634, BLACKWELL, door holder. 6,698, HAYLOCK, heating and ventilating of rooms and buildings. 7,116, MARBURG, rotary pumps. 7,139, HURRY and SEAMAN, process of manufacturing Portland cement. 7,401, RAWLINGS and RAWLINGS, ventilator. 7,528, ALLISON (P. H. and F. M. Roots Co.), rotary pumps. 7,552, JENKINS and HUDSON, construction of weatherproof coverings for shelters, tents, tramcars, etc. 7,750, PRYKE and PALMER, eaves gutters.

Surveying and Sanitary Notes.

Scoria Bricks for Middlesbrough.—The Middlesbrough Council have decided to borrow £8,860 for paving several streets with scoria bricks.

Mr. H. Victor Prigg has been appointed resident engineer in connection with the Plymouth main drainage works at a salary of £300 a year.

A Desirable Improvement.—It has been decided to purchase property at North Hill, Plymouth, at a cost of £1,400, to enable the access to Greenbank Ward to be greatly improved by widening Clifton Place at its junction with North Hill.

A Scarborough Street Improvement.—The improvement in St. Thomas Street, the main thoroughfare between the North Cliff and the centre of the town, is being pushed forward, and the Council have approved the proposal to purchase five houses from Mr. J. W. Jackson for £3,500.

Institute of Sanitary Engineers.—At a meeting of the Election Committee held on June 13th the following gentlemen were elected:—As Fellow: Mr. T. G. T. Wright (Southend-on-Sea). As Members: Mr. R. Clarke (Dawlish), Mr. E. Collard (Herne Bay), Mr. H. H. Oakes (Bridlington), and Mr. W. Whur (Southend-on-Sea).

Grimsby Borough Surveyorship.—Mr. Henry Gilbert Whyatt, deputy borough engineer of Salford, has been appointed as borough engineer and surveyor of Grimsby, at a salary of £400 per annum. There were more than one hundred applications. The new surveyor is thirty-nine years of age, and is the son of a late leading architect of Manchester.

A Mistake about a Footway.—At the meeting of the Bath Town Council held last week the Joint Committee having conducted the negotiations regarding the new hotel in the Orange Grove presented their minutes. These showed that a difference had arisen with Mr. Holland, the lessee, as to a mistake made in the laying-down of the foundations under the direction of the city architect, by which the public footway on the west and north of the hotel, which was arranged to be 20ft. wide, would only be 13ft. Although advised by counsel that they could insist on the 20ft. being observed, the Committee decided to allow the curtailment.—Alderman Jolly moved:—"That Mr. Gill, having reported upon the plans of the new hotel, they be approved subject to the following stipulations: (1) That the East, or Lott Gate, be not interfered with; (2) that provision be made for escape in case of fire, either by means of an external staircase, as required by the Licensing Justices, or by an additional internal staircase if approved by the Justices; (3) that in case of any difference of opinion arising between Mr. Gill, as acting for the Corporation, and Major Davis, as acting for the lessee, with reference to giving effect to the foregoing stipulations, or any other question of difference which might arise, the matter be referred to an archi-

tect to be appointed by the Institute of British Architects, whose decision shall be binding on both parties, but without prejudice to the jurisdiction of the Surveying Committee." This was carried unanimously.

A Carriage-way across Trafalgar Square.—The Commissioners of Her Majesty's Office of Works have consented, with certain provisos, to allow a carriage-way to be made across Trafalgar Square during the building of the Charing Cross Station of the Baker Street and Waterloo Railway. The roadway will run past the Nelson Column and Gordon Statue, but it is stipulated that the railway company must, on the completion of the building of the station, so repair the square as to put it in its present condition.

New Sewage Scheme for Chester.—A Local Government Board enquiry was held last week into the application of the Chester Corporation to borrow £36,000 for purposes of sewage disposal. The scheme is based on a dry-weather flow of 1½ million gallons per day. The sewage would flow into a large circular sump well, would then be pumped and mixed with chemicals, and would flow into precipitating tanks. Then there is an intermediate process of rough filtration, so as to ensure a perfectly clarified effluent before passing on to the polarite filter, of which there would be sixteen. The effluent, after passing over the land, would flow into the river.

Street Improvements at Leeds.—A number of resolutions as to street improvements were adopted at last week's meeting of the Leeds City Council. It was agreed to exchange land in connection with the improvement of East Street, by which the Corporation convey 4 sq. yds. of land to the Leeds Estates Company, and the company dedicate to the street 28yds. The Council also approved the following purchases:—Premises at the junction of Camp Road and Meanwood Street, containing an area of 188 sq. yds. for £1,400; three cottages in Balm Walk, Hunslet, for £375; six cottages and outbuildings in Balm Walk and Low Balm Yard, for £650; 40 sq. yds. of land in Holbeck Lane, with the buildings thereon, for £200; 4,464 sq. yds. of land in Brown's Lane, at 5s. per yard; 168yds. at 10s. per yard; 781yds. at 12s. 6d. per yard; 54yds. of land required for the widening of Tempest Road, Hunslet, at 20s. per yard; 1,795yds. for the widening of Easy Road, at 10s. per yard; 843yds. for making a new approach from Pontefract Lane to Easy Road, at 12s. per yard; 20yds. for the improvement of Meanwood Road, at £4 per yard. For works in connection with these proposed improvements the Council voted a further sum of £3,624.

Manchester Sewage Question.—At the monthly meeting of the Mersey and Irwell Joint Committee held on June 11th, the report of the Consulting Sub-committee stated that in reply to the resolution passed at the last meeting of the Joint Committee a letter had been received from the Town Clerk of Manchester, in which he said: "The Rivers Committee are most anxious to comply with the requirements of the Mersey and Irwell Joint Committee. Under the direction of the Council they have had a scheme prepared by experts, at very considerable cost, which they would at once carry out were they permitted to do so. The Rivers Committee are now having plans and estimates prepared both in regard to the experts' scheme and also that based on the requirements of the Local Government Board, and will at the earliest possible moment lay these before the City Council, that they may consider the same, as well as the communication expected from the Local Government Board. The Rivers Committee will then ask the Council to arrive at a definite decision either to carry out the views of the Local Government Board, or to apply for Parliamentary powers to carry out the scheme of the experts. The Rivers Committee are unanimous in their desire to act promptly, and give effect to the recommendations of the experts." The reports of the experts will be found in the supplements to our issues for January 31st and November 22nd last.

Builders' Notes.

The death is announced of Mr. James Leith, of Aberdeen.—About fifteen years ago, having in the meanwhile extended his granite trade, he acquired Persley Quarries, and also, at a later date, Dunecht Quarries.

Tender for new Schools at Beckingham.—The Beckingham (Lincolnshire) School Board have accepted the tender of Mr. Greenwood, of Gainsborough, to erect new schools and schoolmaster's house for £2,631.

Tadcaster Board School: Tender for Extensions.—At the last meeting of the Tadcaster School Board the various tenders for the enlargement of the school were considered, and that for the building was secured by Mr. R. Brelsford, of East Keswick. The estimated cost of the alteration is £1,680. Additions to the school premises in 1892 cost £1,134.

Stone Quarrying and Dressing.—Messrs. E. Turner and Sons, Penarth Road, Cardiff, have leased several tracts of land in the Forest of Dean, and purchased several existing quarries, where they have for some time carried on their quarrying operations with plant of the most improved kind. In addition, they have leased land where buildings have been erected and machinery and railway sidings laid down similar to those at their Eldon Road Works, Cardiff. For the supply of Bath stone, quarries have also been opened at Box.

What is a "Workplace"?—This question arose in a recent case at the Guildhall, where a contractor named William Brass was summoned for failing to comply with a notice served upon him to make certain alterations in accordance with the Public Health (London) Act, 1891. Mr. T. G. Vickery, who prosecuted on behalf of the Sanitary Committee of the Corporation, said that the summons referred to the third and fourth floors of a building in Threadneedle Street, the lessees of which employed a number of female typists. The two questions to be decided were, whether this was a "workplace," and, if so, whether the person summoned was answerable? Although a "workshop" had been defined, there appeared to be no definition of a "workplace." The complaint was that the sanitary arrangements on these premises were not only inadequate, but were provided for the use of all persons without distinction. Mr. Vickery's contention amounted to this, that these young ladies being mere "mechanical machines," the place where they were employed was a workplace. Mr. Alderman Alliston: This is a most important question, but I hold that this place does not come within the meaning of section 38 of the Public Health (London) Act, and therefore the summons is dismissed.

Fire Tests with Floors.—Nos. 45 and 55 of the publications of the British Fire Prevention Committee deal with fire tests with floors. The first was with a floor and ceiling erected by the Mural and Decorations Syndicate, Ltd., of London, the floor being 10ft. square, with an area exposed to the fire of 77ft. 6in.; it was loaded with bricks weighing 4,536lbs., equal to a distributed load of 56lbs. per sq. foot. Eight weeks (winter) were allowed for construction and drying. The following is a summary of the effect:—A considerable portion of the plaster ceiling fell during the test, some of the lathing being bare before the test closed. The floor cracked at each side to the extent of $\frac{1}{2}$ in. and dropped $\frac{1}{2}$ in. When water was applied smoke, steam, and sparks came through cracks in the top of the floor. One of the joists carrying the ceiling was entirely destroyed, two partially so, and one, though discoloured, was practically sound. The test lasted an hour and a quarter. The object of the test described in publication No. 55 was to record the effect of a two hours' fire on a floor of deal joists and coke-breeze concrete, with expanded metal and plaster ceiling. The floor was 10ft. square and was loaded with 100lbs. per foot distributed; four weeks (winter) were allowed for construction and drying. The following is a summary of

the effect:—In twenty-eight minutes plaster began to fall in patches from the ceiling, and continued to fall at intervals till the end of the test, when water was applied and further plaster was washed away. No other effect of the fire was noticeable, and at the conclusion of the test the floor was intact and carried its load. This test was undertaken in connection with the series of so-called Building Act floors under investigation.

Engineering Notes.

Electric Light for Kilmarnock.—The Kilmarnock Town Council has decided to borrow money for an electric lighting scheme estimated to cost £26,000.

Additional Water for Manchester.—The new works in progress in the Longdendale Valley in connection with the water supply of Manchester have been well advanced during the last few months. The idea is not only to increase the supply from the reservoirs, but also to further purify the water delivered from Derbyshire.

Proposed Groynes for Swanage.—Considerable opposition was raised at a Board of Trade enquiry at Swanage on Friday last with respect to the proposal of the Urban District Council to erect twenty-six groynes, each about 173ft. long, on the foreshore, which, it is contended by the promoters of the scheme, is in danger of being swept away.

Big Electricity Supply Scheme for Yorkshire.—An influential syndicate proposes to supply electricity to the manufacturing portion of the West Riding of Yorkshire. The scheme is somewhat on the lines of the Lancashire electric power supply scheme, the Bill in connection with which has passed the second reading in the House of Commons, and is now before the Select Committee.

Extension of Paisley Waterworks.—In connection with an application by the Paisley Water Commissioners to the Secretary for Scotland for a provisional order to borrow £200,000 for the purpose of extending the waterworks of the town, an enquiry was held last week. Mr. Lee, Master of Works, explained in some detail the nature of the work to be undertaken, such as increased piping over eight miles of country, to make the supply from Camphill to Rowbank reservoirs 20 millions instead of 3½ millions; the provision of extended filtration; to make the water more wholesome; the augmentation of the supply to Johnstone; and the renewal of old mains and the laying of new ones.

To Connect New York with Brooklyn.—The bridge now under construction for connecting New York with Brooklyn will have a bicycle path, covered with asphalt, carried at a certain height above the tracks for trolleys and for carriages. This bicycle track is to be for the exclusive use of wheelmen, and the opposing streams of traffic will be carefully divided. Beneath it is a footway for pedestrians, and above it the track for the elevated railway. On each side are double trolley tracks affording accommodation for four cars abreast, while the outer sides of the bridge are reserved for carriages and vehicles going the same way, so that the traffic will be as little impeded as possible. The bridge is to be 7,200ft. long, or nearly a quarter of a mile longer than the present bridge, most of this increased length being taken up by the approaches.

Electric Traction.—At a meeting of the Society of Engineers held on June 11th, Mr. Henry O'Connor, president, in the chair, a paper was read on "Electric Traction" by Mr. Algernon Hamo Binyon. The author first compared the London traffic, with that of New York, and gave figures of its distribution by various channels. He stated that the underground railways in London took only 19 per cent. of the total traffic as against 81 per cent. conveyed by omnibuses and tramways—horse and cable. He favoured the overhead trolley system, as used in nearly all English towns, as being the most efficient and economical, and he advocated the side trolley system, which obviates the unsightliness of

very long brackets. The author expressed the opinion that the London United and the London County Council tramways would in time force railway companies to adopt electric traction, even for suburban traffic within a radius of between 10 and 25 miles round London, that being probably the range within which competition would be strongly felt; beyond that a steam locomotive would beat its electric rival. In combining lighting and tramway plant, Mr. Binyon advocated completely separate dynamos and mains.

Dockisation of the Avon.—The report of the three experts appointed to consider the practicability of docking the river Avon has now been made public. The scheme, they think, is practicable, and it would include the diversion of the Avon from a point below Pill Ferry, Bristol, to a new outfall across Flatness Rocks, at a point about 1½ miles above the pier of Portishead Dock. The estimate is as follows:—Diversion of river Avon and construction of reclamation embankment, £765,000; dock works, including deep-water quays, lock, graving dock, etc., £1,446,000; allowance for sheds (525,000 sq. ft.) and buildings, £172,000; railways and sidings (twelve miles) and passenger station, £42,000; cofferdams, temporary watercourse diversions, and compensations, £50,000; capitalised cost of working sluices and dealing with floods, £100,000; land and Parliamentary expenses, £100,000; sundry expenses and engineering, £100,000—total, £2,775,000. Sir John Wolfe Barry's estimate of the work in 1896 was £1,880,000, exclusive of the diversion of the sewage and of improvement works at Bristol. The substantial addition is due partly to the increase in late years of the cost of labour and materials, and also to the proposed diversion of the river.

Masters and Men.

The Keighley Joiners have been granted an advance of 3d. on the wage rate of 7½d. per hour, making 8d., and the masters have further agreed that 49½ hours shall constitute a week's work instead of 48.

The Fair Contracts Conference in Bradford was held last week, Mr. James Watson (president) being in the chair. The Spen Valley and Shipley delegates reported that in their respective districts little propagandist work had been attempted since the conference last met, with the exception that all obtainable literature was being systematically circulated with a view to creating further public interest on the question of fair contracts. The following officers and committee were elected:—President, Mr. G. Holmes (Building Trades Federation); vice-president, Mr. C. Henderson (Spen Valley Trades Council); secretary and assistant secretary, Messrs. A. F. Paine and J. T. Hart (Typographical Society); committee, Messrs. William Hardaker (Joiners, No. 2 Branch), J. F. Atkinson (Ironfounders), H. Wells (Shipley Trades Council), and a delegate to be appointed by the Stanningley Trades Council.

Strike of Birmingham Bricklayers.—In consequence of a dispute which has occurred at the Nechells Gas Works between fifty and sixty bricklayers engaged in building the new retorts have come out on strike. The trouble appears to have arisen over the time at which the men are paid. It is laid down in the society's rules that all members shall be paid at one o'clock on Saturday. It has, however, been the custom at the gas works to pay bricklayers and their labourers at five o'clock on Fridays. In deference, however, to the wishes of the society the Gas Committee issued instructions for the outside men engaged on the new retort work at Nechells to be paid on the Saturday. But this does not appear to have satisfied the society, and because all the bricklayers in the service of the Gas Committee are not paid on Saturdays they called the men at Nechells out on the Saturday morning and the others at Sattley Works out on last Monday week. Many of the men prefer being paid on Friday evenings. Altogether nearly one hundred bricklayers are affected by the dispute.

Keystones.

A new Organ at Ranmoor Church, Sheffield.—Has been built at a cost of about £1,500 by Messrs. Brindley and Foster.

New Clinical Laboratories to Westminster Hospital were formally opened last week. The cost has been (together with other hospital improvements) £10,000.

New London Music Hall.—The foundation-stone of the new Euston Theatre of Varieties was laid last week. It is situated immediately opposite St. Pancras Station.

Abdie Parish Church, near Newburgh, Aberdeen.—A new stained-glass window has been erected in this church. It was designed and executed by Mr. N. Bryson, of Edinburgh.

Hull's New Library.—The new Central Library which is being erected in Albion Street, Hull, is to cost £17,211. About £2,500 will be spent on furnishings, and £1,500 on new books.

Kirkstall Abbey in 1793.—A painting of interest from an antiquarian point of view has just been presented to the Leeds Art Gallery Committee. It depicts the ruins of Kirkstall Abbey as they were in the year 1793.

New Infectious Diseases Hospital for Colne.—It has been decided to erect a infectious diseases hospital at the Old Earth Farm, near Colne, at a cost of £6,750. The land (four acres and a half) will cost £1,780.

Newcastle School Board: New Buildings.—It has been decided to borrow money from the Public Works Loan Commissioners for the erection and furnishing of the new Board Offices and Pupil Teachers' Centre (£13,552), and to complete the purchase of North View School (£6,850).

New Church-tower Clock in Leeds.—A new clock has been placed in the tower of St. Mark's Church, Woodhouse, Leeds; it was fitted by Messrs W. Potts and Sons, of Leeds, and has four dials, which will be lighted by electricity. Extensive alterations to the tower were needed in order to enable it to receive the clock.

At St. James's Church, Toxteth, Liverpool, a new chancel has been erected from designs by Mr. J. H. Havelock Sutton. It is built of red Ruabon bricks, and has an elaborate encaustic tile floor, with mosaic tiling inside the communion rails. The tiling was executed by Messrs. Swift and Co. Mr. William Wood was the general contractor.

A new Church at Preston, Sussex, to be called the church of St. John the Evangelist, is proposed to be built. The late Sir Arthur Blomfield prepared designs for a building to seat 1,000 worshippers, the cost being £12,000. It is proposed to erect the western portion of the church first, capable of seating 600 persons, and for this purpose a sum of £5,500 must be raised before the contract is signed.

A Soldiers' Memorial.—The Princess Louise, Duchess of Argyll, last week unveiled the memorial which has been erected in Canterbury Cathedral to the memory of Second Lieutenant Monsell and 111 non-commissioned officers and men of the Buffs who fell during the operations on the North-West Frontier of India during 1895-98. The monument, which has been executed by Mr. Thomas Rudge, of Clapham Common, is in the Early Decorated style.

Proposed Municipal Buildings for Leigh.—At last week's meeting of the Leigh Town Council the Surplus Lands Sub-committee reported that they had carefully examined the estimate and plans prepared by Mr. J. C. Prestwich for the municipal buildings proposed to be erected on land in Market Street and Market Place, and were of opinion that the cost for land, buildings, furniture, fixtures, painting, and decorating would be £40,000, including £25,000 for the cost of the building. They stated that after further consideration they were of opinion that it was desirable to erect a court-house in conjunction with the proposed buildings. After discussion the report was adopted.

Princes Risborough Church, Bucks.—The tower and spire of this church are to be restored at an estimated cost of £1,800.

A new Board School at Woodhouse, Sheffield, has been built by Messrs. Pinder Brothers, of Intake, from plans prepared by Mr. J. D. Webster, architect, of Sheffield. It has accommodation for 580 children—420 in the mixed department and 160 in the infants'—and, including the site, has cost about £6,673, or at the rate of £11 10s. 1d. per child.

Bridgegate Parish Church, Glasgow.—The new Bridgegate Parish Church in Commercial Road, Glasgow, is being built from plans prepared by Messrs. W. Baird and James Thompson, architects, of Glasgow. Its front elevation in Commercial Road is built of red sandstone, and the building extends backwards to Wellington Lane; it will accommodate 700 worshippers.

The Imperial Memorial to Sir George Grey is to take the form of a bust to be placed in the crypt of St. Paul's Cathedral, and a portrait to be hung in the National Portrait Gallery. Professor Herkomer has agreed to paint the portrait, and Mr. E. Onslow Ford to execute the bust. The Governments of Cape Colony, New Zealand, and Australia have subscribed to the fund; and amongst private subscribers Mr. Cecil Rhodes has given £50.

The Prehistoric City of Tikal in British Honduras is proposed to be explored under the direction of the Marquis of Granby, who is the president of the British Archaeological Association. The city is situated in an almost direct line sixty miles west of Belize. There is plenty of work to be done in the cities of the Aztecs, for terraces, temples and columns comprising invaluable archaeological remains are still to be seen above ground. Americans representing different learned and archaeological societies are very busily engaged in exploring the Aztec cities in Spanish Honduras.

Buildings for Consumptives.—In the report on consumption which the medical officer of health has presented to the Vestry of the parish of Hammersmith it is stated that fireplaces should not be closed up, and bedroom windows should be kept open, night and day, except when the weather is too damp and cold; also, where practicable, electric light should be used for lighting purposes in dwelling-houses and other occupied buildings, as nothing tends more to the production of consumption than the breathing of an atmosphere charged with the products of combustion, whether such products are the result of overcrowding or otherwise.

Church Extension at York.—The new church of St. Luke, Burton Stone Lane, York, now in course of construction, has been designed by Mr. Brierley, architect, of York, and will cost £8,000. Accommodation will be provided for 800 persons. At present it is intended to build only the vestries, chancel, and aisles, which will accommodate 300, with a temporary west end, which can be taken down when the remainder of the work is proceeded with. The building is being erected of brick with Ancaster stone dressings, and the roofs are to be covered with green Westmorland slates. The contract has been let to Mr. Ullathorne, of Selby, and the estimated cost of the section under construction is £2,600.

Suggested Public Baths for Scarborough.—At last week's meeting of the Scarborough Town Council a deputation from the Scarborough Amateur Swimming Club attended to urge the Council to utilise the Empire Buildings—often styled the Exhibition Buildings—on the South Foreshore Road, which were bought last year with the St. Nicholas House estate, for the purpose of municipal sea-water swimming baths. The club had gone thoroughly into the matter, and presented a report with plans prepared by Mr. H. Ascough Chapman, showing how the building could be adapted to provide ladies' and gentlemen's swimming baths, Turkish bath, and slipper baths, at a cost of about £6,000. The memorial and report were referred to the Corporation Property Committee.

New Wesleyan Schools at Workson have been erected from designs by Messrs. Flockton and Gibbs, of Sheffield, at a cost of £2,097. Messrs. Rawson and Son, of Tickhill, were the contractors.

Ossett Sewage Extension Works.—The Ossett Town Council have authorised the purchase of about thirty acres of land near the riverside at Healey for the extension of the southern outfall sewage works.

New Drinking Fountains.—Mr. Passmore Edwards has offered to present to the Metropolitan Public Gardens' Association two drinking fountains to be placed in the grounds of the church of St. George the Martyr, Southwark.

A new Mission Chapel at Canworthy Water, Cornwall, which is about ten miles from Launceston, has been built from the designs of Mr. Edmund Sedding, architect, of Plymouth. The builder was Mr. F. Nicholls, of Polyphant.

Sheffield's new Fire and Police Station.—The building of the new police and fire station in Westbar, Sheffield, is approaching completion. The fire department is larger than that for the police, which is to the left and contains a charge office, telephone room, search room, inspector's private room, waiting room, and four cells.

New Church at Muswell Hill, N.—The foundation-stone of the new church of St. James, Muswell Hill, was laid on Wednesday last. The architect is Mr. J. S. Alder, of Arundel Street, Strand, and the design is in the Perpendicular style. The church is to be built of Ancaster stone, with Bath stone dressings, at a cost of £13,500; it will have a spire 170ft. high.

The Granville Hotel, Ramsgate, has been considerably enlarged and entirely remodelled. Facing the sea there has been constructed a new central entrance which leads into a large hall well furnished with lounges. On the left of the hall is the reading room and library, and further on is the smoking room, decorated in Oriental style. The ground floor also contains two new dining-rooms, a large billiard-room and a spacious ballroom. The total number of rooms is about 300, and of these 70 have been added in the rebuilding.

Isolating the National Gallery.—In the House of Commons on Friday last Mr. Akers-Douglas said: "The fire which occurred on May 30th last in premises adjacent to the National Gallery tested the arrangements hitherto made for the protection of the Gallery against fire, and the result was in the main satisfactory. In the opinion of Her Majesty's Government the risk at the present time is slight, but in order to reduce it to a minimum negotiations have been commenced with the owners of the adjacent property with a view to the isolation of the western end of the National Gallery. Should these negotiations fail—which, I hope, may not be the case—Parliament will be appealed to in the usual manner to furnish powers to the Government for the immediate acquisition of the property in question."

Court of Common Council: The New Sessions House.—At last Thursday's meeting of this Council the report of the City Lands Committee with reference to the designs for the new Sessions House in the Old Bailey came up for consideration. As we stated in our issue for June 6th, the design recommended was numbered 4, while that numbered 6 was spoken of with praise. The Council adopted their committee's recommendation. No. 4 is by Mr. Edward W. Mountford. Of the remaining five designs, No. 1 is by H. T. Hare, No. 2 by Mr. H. L. Florence, No. 3 by Mr. J. M. Brydon, No. 5 by Mr. Frank Bagallay, and No. 6 by Mr. John Belcher. In accordance with the resolution of the Council, the drawings were on view at the Guildhall at last night's conversazione of the Royal Institute of British Architects, and they can now be inspected by the public. We shall publish a critique of the designs next week. Mr. Mountford designed the Battersea Town Hall and the Northampton Institute, Clerkenwell.

BUILDING TRADES' GIFT TO THE NATION.

THE following further subscriptions have been received by the executive of the Gift:—

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BECKINGHAM (Gainsborough).—For the erection of Board schools and master's house, for the School Board. Messrs. Eyre and Southall, architects, Retford. Quantities by the architects:—
Bee and Son ... £3,097 0 | J. Furniss ... £2,919 0
Rowell ... 2,986 0 | T. Hopkinson ... 2,910 0
G. Hopkinson & ... 2,982 0 | C. Greenwood, ...
Brown and Son ... 2,974 0 | Gainsborough* ... 2,631 12
J. Woods ... 2,964 0

* Reduced and provisionally accepted.

BLYTH, RETFORD.—For the erection of Wesleyan chapel and schools, for the Trustees. Messrs. Eyre and Southall, architects, Retford. Quantities by the architects:—
T. Hopkinson ... £2,420 | T. H. Harrison, ...
G. Hurst ... 2,420 | Scrooby* ... £1,186

* Accepted.

CROYDON.—For alterations and decorations at The Mount, Duppas Hill, Croydon, for Mr. W. F. Knight. Mr. H. Fuller Clark, architect, 28, John-street, Bedford-row, W.C.:—
Hayward and Son ... £1,395 | J. and C. Bowyer ... £1,249
Wm. Smith and Sons ... 1,255 | W. B. Simpson & Son* 1,100

* Accepted.

LONDON.—For the electric wiring of Archbishop's residence, Westminster, S.W., for Cardinal Vaughan. Messrs. O'Gorman and Cozens-Hardy, consulting engineers, 82, Victoria Street, Westminster, S.W.:—

	Section A.	Section B.	Section C.	Reduction.	Lump sum for A, B, & C, if placed together.	Schedule Prices.

* Accepted.

Section A. House Wiring.

† Cannot quote for lamps.

Section B. Bells.

‡ Not to specification.

Section C. Lamps.

LONDON.—For erecting a three-storey factory and other alterations at Crosby-row, Bermondsey. Mr. Edward Crosse, architect:—
G. Parker ... £2,050 0 0 | J. Chalkley ... £1,659 0 0
J. Young ... 1,697 0 0 | Newton ... 1,644 13 11
H. J. Williams ... 1,683 0 0 | Wells and Son* ... 1,615 0 0
F. and H. Higgs ... 1,670 0 0

* Accepted.

LONDON.—For erection of stabling for Messrs. Tilling and Co., at Lee, S.E. Mr. A. L. Guy, architect:—
Derman ... £6,622 14 | Staines ... £3,500 0
Daly ... 5,880 0 | Faulkner ... 5,583 0
Havell ... 5,798 0 | Jerrard ... 5,561 0
Courtney ... 5,697 0 | Kennard Bros.* ... 5,533 0
Leng ... 5,622 0

* Accepted.

LONDON.—For alteration to the "Princess Alexandra" public-house, Barking-road, London, E. Mr. Herbert Riches, architect, 3, Crooked-lane, King William-street, E.C. Quantities supplied:—
Courtney & Fairbairn £1,205 | T. Osborn and Sons* £1,067
Sheffield Bros. ... 1,156 | T. Welsh ... 925
W. J. Maddison ... 1,142

* Accepted.

† Withdrawn owing to error.

COMING EVENTS.

Wednesday, June 20.

ROYAL INSTITUTE OF BRITISH ARCHITECTS (General Architectural Congress).—Mr. E. W. Mountford, Sir William Richmond, K.C.B., R.A., and Mr. Roscoe Mullins on "The Collaboration of the Architect, the Painter and the Sculptor," 11 a.m. Visit to the new Westminster Cathedral, 3 p.m. Mr. Halsey Ricardo, Mr. W. D. Caroe, the Earl of Meath, and Mr. T. Stirling Lee on "The Ideal City—Streets and Bridges; Public Monuments; Public Gardens and Open Spaces," 8 p.m.

SOCIETY OF ARTS.—Conversazione at the Natural History Museum, Cromwell Road, S.W., in the evening

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.—Annual Meeting in Society of Antiquaries' Rooms, Burlington House. 5 p.m.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.—Annual General Meeting at Cardiff (Second Day). Mr. Alfred J. Jenkins, A.M.I.C.E., on "The Relationship between the Cost of Water Wasted and the Cost of Detection," 10 a.m. Visit to the Corporation Waterworks, 2 p.m. Annual Dinner at the "Esplanade" Hotel, Penarth, 7.30 p.m.

CHURCH SANITARY ASSOCIATION.—Annual Meeting at Church House, Westminster. 5 p.m.

Thursday, June 21.

ROYAL INSTITUTE OF BRITISH ARCHITECTS (General Architectural Congress).—Visit to University College Hospital Extension, Gower Street, W.C., 12.30 p.m. Visits to Stafford House and other large houses, 3 p.m. Mr. Reginald Blomfield on "The Education of the Public in Architecture," 8 p.m.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.—Annual General Meeting at Cardiff (Third Day). Mr. Archibald Elliot, D.Sc., on "The Strength of Bricks and Brickwork," 10 a.m. Visits to Lewis Merthyr Collieries, at 1.45 p.m., and to Barry Docks, Waterworks, &c., at 3 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting. 8.30 p.m.

Friday, June 22.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Annual Dinner at the Whitehall Rooms, Hôtel Métropole, 7.30 p.m. (General Architectural Congress).—Business Meeting. Mr. Lacy W. Ridge on "Uniform By-laws"; Mr. Charles Hadfield and Mr. A. E. Sawdry to move the following resolutions: (1) That in the interests of architecture it is inexpedient that buildings of a municipal character be designed and erected by engineers or surveyors having no architectural training; (2) That as a matter of sound finance and in the interests of rate-payers it is desirable that the duties of the borough engineer and surveyor should not include work of an architectural character; (3) That it is detrimental to the interests of the architectural profession that buildings of a municipal character should be designed and erected by the borough engineer and surveyor, 11 a.m. Visits to Messrs. James Powell and Sons' Glass Works, Whitefriars, E.C.; and Messrs. Holloway Bros. Works, Westminster, 3 p.m.

Saturday, June 23.

ROYAL INSTITUTE OF BRITISH ARCHITECTS (General Architectural Congress).—Visit to Greenwich.

Tuesday, June 26.

INSTITUTION OF ELECTRICAL ENGINEERS.—Conversazione at the Natural History Museum, Cromwell-road, 9 p.m.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.—Special meeting for the election of an orphan.

Wednesday, June 27.

INSTITUTION OF MECHANICAL ENGINEERS.—Annual Dinner at the Hotel Cecil. 7.45 p.m.

TIMBER TRADERS' BENEVOLENT SOCIETY.—Festival Dinner at Trocadero Restaurant. 7 p.m.

SOCIETY OF ARTS.—Annual General Meeting. 4 p.m.

Thursday, June 28.

INSTITUTION OF CIVIL ENGINEERS.—Dinner to Sir Douglas Fox, president, by the Council and Officers of the Institution, Grand Hotel. 8 p.m.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—Annual Dinner at Frascati's Restaurant. 7.30 p.m.

Saturday, June 30.

ARCHITECTURAL ASSOCIATION.—Second Summer Visit to Christ's Hospital, Horsham.

PERFECTION IN Spring Hinges

The "VICTOR" Double Action Spring Hinges open wider than any other—viz., 135° each way, i.e., 45° beyond right angles—and close with a perfect check action.

STRAND, W.C.

An Architectural Causerie.

The New Sessions House. THE competition for the new Sessions House for the City of London is of the first importance, and Mr. E. W. Mountford is to be congratulated on having been successful against such distinguished competitors.

In many ways the result of this competition is a great disappointment. The competitors were presumably chosen as being the best, but we feel that they have not done themselves justice, and that the outcome is not the best the profession could produce. Whether better results could have been obtained from an open competition, or by a different selection of competitors, is a debatable point.

When one thinks of the possibilities of such a building as this; of the great results that might, and have, elsewhere been obtained; of the overpowering and painful human interest of the subject, and the atmosphere of sordid tragedy that surrounds it; one cannot but regret that so fine and rare an opportunity for poetic expression has been neglected. This may not be altogether the fault of the architects.

The practical problem to be solved was by no means easy, for the scheme suffers—as London schemes too often do suffer—from an insufficient and cramped site. So much is this the case that there was no chance to set the building out in a fine monumental way, on good architectural lines. The consequence is that none of the designs can lay claim to be considered as a complete artistic conception, in the real meaning of the word. The City Fathers do not seem to have realised that such a building as this is more than a mere convenience for adequate disposal of criminals; that it is also a public monument—a work of art—of the first importance, and, as such, that it needs an open and isolated site. Some day, we suppose, this will be understood.

In this case the restricted site has caused all the competitors to place their courts on the first floor, so as to get a floor below them for other necessary accommodation. This is wrong in idea, and would never be done where space was sufficient. It destroys the monumental effect and tends to rob the building of character. It also creates the difficulty of dealing with the space below, and of lighting it adequately, which difficulty none of the competitors seem to have entirely overcome.

Under these circumstances it is not easy to say exactly how these designs should be criticised, and from what point of view they

should be regarded. As monumental creations they are out of court, and they will not for a moment compare even with such buildings as the Horse Guards.

If we wish to judge them solely from the point of view of convenience of arrangement, it is taking a very low standpoint and ignoring the one quality that distinguishes architecture from convenient building; and even then, it is difficult to arrive at a right judgment without access to all the information which was at the disposal of the competitors, and without taking time to master

and made the best of the circumstances; and how far the different designs lend themselves naturally to an artistic treatment.

Speaking generally, it must be regretted that none of the designs have any special and distinctive character. Not one of them looks like a Sessions House, and this, from the artistic point of view, is the first and most important feature. As a matter of fact most of them look much more like Government or municipal offices, or large hotels. No one could guess, from the outward appearance, what they really are. It seems a pity that dis-

NEW SESSIONS HOUSE: HALL ON FIRST FLOOR. BY EDWARD W. MOUNTFORD, F.R.I.B.A.

all the conditions, and weigh the pros and cons of the various arrangements. The competitors have, perhaps, taken months to work out these designs, and the arbitrator as many weeks to judge them; it is too much to expect the critic in as many minutes to set them all right, and tell them all about it, especially in a case like this where the scheme is large and rather complicated, and the designs are, generally speaking, of fairly equal merit. But what is possible is to notice how far the designers have taken advantage of whatever opportunities the nature of the programme afforded them to obtain a true and characteristic effect; how far they have modelled and grouped their different arrangements towards this end,

and how far the different designs lend themselves naturally to an artistic treatment. There may be practical disadvantages in placing the courts at the front—such as the noise from the street—but it still might have been possible to keep the courts back, and yet show them over the tops of the lower corridors or small rooms surrounding them. The large hall, too, might have been more clearly emphasised on the outside. However, it is of no great importance what method is adopted to obtain a characteristic effort, so long as the method is truthful and the effect is there.

As regards the style adopted, there is no great effort at progress, or any real origin-

ality. The designers have been content to take a certain phase of the Renaissance and to produce a study in this particular style, treating it severely and plainly for a criminal court, as they would treat it elegantly and freely for a theatre.

This seems to be the limit to their endeavours to express the character of the building. Of course, no architect deludes himself with the idea that this sort of antiquarian exercise constitutes a real living art, but the danger is that the public may so understand it, unless it is distinctly informed to the contrary.

With regard to Mr. Mountford's successful design, the plans we publish will explain the arrangements on the two principal floors, and so render any detailed description unnecessary. The second floor is occupied by the counsels' robing-room, and various rooms for the solicitors, clerks, the Press, &c. The lower ground floor contains cells, record rooms, &c.

This design appears to be most practical, workable, and generally convenient. The author wishes it to be regarded as a sketch, capable of modification and improvement. It is to be hoped that plenty of time and encouragement will be given him by the Corporation to reconsider and improve it. A few months delay will mean little loss to the public, but it will mean a great deal to the building, if the architect makes the most of it.

It seems to us that much could be done to this design to give it more expression without disturbing the general idea. From this point of view most distinctly do we object to the curved line of the frontage to Newgate Street. It expresses nothing of the inside arrangements; on the contrary, it distinctly misrepresents them. It leads to awkward shapes on the plan, it gives no added accommodation of any practical value inside, while the space it occupies would be invaluable outside, if thrown into the pavement of the street. It means added expense without corresponding advantage, either in convenience or appearance, and the effect in the perspective view reminds one of a man with a swollen face.

On comparing the ground and first floors one is struck immediately with the large amount of wasted masonry in the entrance hall. The great thickness of walls here make the rest look weak. On comparing this with Mr. Baggallay's plan the contrast is ludicrous. One would naturally expect to see these walls going up to a great height, but they disappear on the first floor, with the exception of the piers for the tower, and we find the semi-circular recesses in the hall only carry the floor of the courts above. It is rather a defect of this scheme that the ground and first floors have not sufficient relation one to the other.

As a matter of taste the front entrance doorway seems out of proportion and out of keeping—it does not fit in very well; and the windows each side, which light the circular recesses to the hall, seem too wide and somehow out of scale. We think the dome might be improved, or left out altogether.

The adoption of a mezzanine floor in a building where large and small rooms have to be on the same floor is a good idea to save space, and it permits a more economical treatment, though it often leads to difficulty or deception in the elevation.

Taking this design as a whole, it seems to us to be the most complete and harmonious as far as it goes. The drawings which illustrate it are good, the elevations have a nice quality, although they would have probably looked better still had the tinting been graduated off lighter towards the bottom of the drawing. The detail which is ruled over in lines with light ink, to produce the effect of a flat tone, seems to be a great waste of time, especially for a competition drawing.

A. R. J.

On Reflection.

A New Art Museum.

THE work of converting Hertford House, Manchester Square, from a private residence into a national gallery has been going on for some time. There were doubts and misgivings as to whether it would not have been better to provide a new place altogether than to attempt what has been done, but the result has made it perfectly clear that no better course could have been adopted, and the public from this time forward may regard as its own the truly magnificent building to which it was admitted last Monday. There was fortunately room enough at the rear to admit of plans for additional galleries being set forth on a liberal scale. We may now at the close of the century, and with a great deal of pride in the act, take stock of the nation's art galleries. The builders of this and the Tate Gallery have shown what should have been done long ago with the South Kensington shambles. The National Gallery and British Museum with their parental air of authority have a serenely classical aspect befitting their age and purpose, and taking them altogether we may be thought to be rich in art galleries. In Hertford House there is a liberal allowance of space to everything that deserves it, and none of the restraint that is felt in such a ridiculously ill-fitted place as the house in Lincoln's Inn Fields, containing the miscellaneous accumulations bequeathed by Sir John Soane to the nation "on condition," &c. The most illiberal thing in the world is a bequest with any condition attached, and we have examples more than sufficient to prove what a nuisance it may become, but there is none of this feeling here. In the columns of a builders' paper one is not expected to say much about pictures; but let it be said generally that whereas in the National Gallery the makers of the French school are hardly represented at all, their works are here in such numbers as to suggest that it would be possible to have rather more than enough. But no serious student of art would be inclined to say this for a moment. The greatest names are the best represented, and the addition to our store is invaluable. This is true of pictures, and it is true of French art altogether.

The Education of the Public.

THE General Architectural Congress, held during last week, has, on the whole, been most successful. As Mr. Brydon pointed out last Thursday evening, the first three papers naturally led up to that great subject treated of by Mr. Blomfield, "The Education of the Public in Architecture." Now, although that paper was fruitful of a remarkably good and interesting discussion, it certainly led to no clear definition of principles. The only result it had, perhaps, was to show the great divergence of opinion among architects. Now it has become a truism to say that architecture is merely refined building, but this view still wants insisting upon. As Mr. Mountford said at the second meeting for the consideration of papers, architecture is not dependent upon painting or sculpture. True also was Mr. Pite's statement that the qualities of good architecture were chiefly mass and void, proportion, light

and shade, the true application of mouldings, and the application of colour. We have all seen the lamentable effect of archaeological study in furthering copyism, and something above this can only be achieved by attention to the elements of architectural effect as pointed out by Mr. Pite—that is, we must have refined building. Sir William Richmond in his paper put this point very aptly. When success has been achieved in this direction, then only can attention be turned to the bringing in of other arts to enrich the skeleton structure. The first thing, as all recognised, is for the architect to educate himself. It is hopeless to expect—at any rate in the near future—to educate the great mass of the public to any intimate appreciation and knowledge of what is good architecture; all it will do is simply say it likes this or it dislikes that.

Architecture and Economics.

WE are inclined to believe the whole point of the matter lies in the question of social economy. When men evolved the system of dependence on one another for necessities they at once began to study economy; and tracing the course of this movement in architecture we see how the guilds of builders were the only persons doing such work in the age they existed in, and therefore, being the only builders, were the cheapest to obtain work from. Of course, then as now, economy was not studied particularly in public buildings. When the guilds were becoming effete from various causes the Renaissance architects forced their designs upon the craftsmen, and this system has developed in the present day into the system of designers and contractors, neither knowing much of the other's work, and, to meet the need for economy, the speculative builder. Nowadays, instead of the speculative builder being an artistic designer as in the days of the guilds, he is merely a purveyor of cheap frippery. As Mr. Pite pointed out the most highly ornamented goods are generally the cheapest at the present day, contrary to commonsense. This should not be so. If our designers would but come into the market, offer a better thing to the public at nearly the same cost, and an unornamented work at as cheap or a cheaper rate than modern "trade" stuff, the public would be appreciative. The public would be quite prepared to pay slightly more were it proved to them that this was true economy, in obtaining a better and more lasting article. These are the lines, we would say, along which progress may be hoped for in architecture: let the architect decide to abandon imitation; let him learn the practical and commercial side of the question. Do not let the economic side remain in the hands of capitalists without artistic feeling, but let us have artistic speculative builders. When architects have once again become the actual builders, the general public—always indifferent to things that they do not understand—will be insensibly forced to take the old line, and the architect could return to that true system, as under the guilds, of designing in detail upon the actual work while it is being erected and not on paper. Such a measure of the Guild system would virtually constitute Architects' Registration. The advantage that would accrue to the architect we need not enlarge upon. Of course the man of smaller capital, and perhaps greater artistic genius, would not lose any part of his living at present gained—there would still remain the non-speculative work for him to undertake.

MR. EDWARD W. MOUNTFORD, F.R.I.B.A.

SESSIONS HOUSE DESIGNS, Nos. 4 and 6.

THE ARCHITECTS' REPORTS.

IN the particulars accompanying his design (No. 4) Mr. Mountford says:—In the design generally, impressiveness and dignity have been considered of primary importance, and ornament has been sparingly used. The north-west corner of the building has not been rounded off, as suggested—it seemed to detract

from the dignity of the building—but the same result has been obtained by curving the whole of the Newgate Street front, which would at once produce a pleasing effect of light and shade and would overcome the difficulty of the awkward break in the building line at the eastern extremity of this front. I would ask you to regard my design as a sketch still capable of considerable improvement in matters of detail with more time at command and opportunity for consultation with your various officials. The difficulty has been to provide all the accommodation required in an impressive and dignified manner, the area of the site being somewhat limited for its purpose. In a monumental building spacious halls and corridors, well lighted throughout, are of great importance, and a sufficient height must be obtained for the principal rooms. It has appeared to me that the only satisfactory method of meeting these requirements is by a system of mezzanine floors, which allows considerable height for the larger rooms and offices without the waste of space incurred by giving the same height to the smaller rooms. My drawings will fully explain this, and it will be observed that the arrangement has the additional merit of bringing the various rooms and floors into closer connection with each other. The principal entrance to the building is from the Old Bailey, and is 14ft. wide; immediately facing it is the chief staircase, 13ft. wide, the entrance hall being about 100ft. by 40ft. The large central hall on the court floor has (exclusive of corridors 10ft. wide) an area of about 3,000ft. super., there is also one court having an area of about 2,494ft. super., another court about 2,088ft. super., and two more courts each about 1,218ft. super. The walls to be built of brick and faced with Portland stone. The courses of the stonework of the principal elevations have been made of the same height as those in the present external walls of Newgate, with the idea of using as much as possible of the old stonework, should it prove to be sound. The area will be lined with glazed bricks and the floors of the hall and main corridors will be laid with black and white marble. The courts and the principal rooms will be of wainscot oak and

the ceilings of fibrous plaster. The framework of the dome will be entirely of British steel, and I should propose to cover it externally with copper. The courts are lighted entirely from the roof, the outer skylights being of rough plate glass, while the inner domes would be glazed with white cathedral or window glass. The space between would be warmed in order to prevent draughts. All the private offices and rooms, including the Lord Mayor's suite, have open fireplaces. The courts, central hall and entrance hall will be heated by hot air and the offices and corridors generally by steam ventilating radiators. The two large courts are 35ft. high to the top of the main cornice, above which the dome gives an additional 5ft. The two smaller courts are 19ft. high to the cornice and 25ft. to the crown of the arched ceilings. The following is the estimated cost of the building:—

Main building, 2,387,326 cubic feet, at 1s. 6d. per cubic foot	£179,049
Dome above main building, 128,995 cubic feet, at 2s. 6d. per cubic foot	16,124
Fittings in the two large courts, £3,000 each	6,000
Fittings in the two smaller courts, £1,500 each	3,000
Fittings in offices	1,500
Fittings in refreshment rooms	1,000
Panelling, &c., in Lord Mayor's rooms	1,500
Lifts	1,000
Electric lighting and fitting	3,000
Heating and ventilating	6,000
Sculpture	3,000
Contingencies, say	4,000
	£225,173

In the particulars accompanying design No. 6 Mr. Belcher says:—The exterior of the building to be of Portland stone and the walls of areas to be of glazed brick. The entrance hall and great hall would be partly constructed in Bath or Caen stone, and the walls and ceilings finished in Keene's cement. The fittings and panelling in each court to be in oak, the upper part to be treated in plaster. Heating to be by steam at or below atmospheric pressure, with radiators, and ventilation of the courts to be on the "plenum" system, the whole arranged so that each court is independently heated and ventilated. Van Kannel revolving doors to be used. Ventilation of the offices on the exhaust system. Estimated cost of buildings, £217,000.

ELEVATION IN OLD BAILEY

GENERAL ARCHITECTURAL CONGRESS.

THE NECESSITY FOR CONTROLLING CITY ARCHITECTURE.

AT the second meeting of the General Architectural Congress, held on June 19th, Mr. William Emerson, President R.I.B.A., read a paper on "The Necessity for Official Control over Architecture in our Towns and Cities." He said: The period of the most extraordinary and spontaneous revival in the art of architecture during the fourteenth and fifteenth centuries, known as the Renaissance, had been preceded by a wave of great interest in the advance of learning, culture and knowledge. The century now at its close has

metropolis and large provincial towns were ever to be worthy of the great British Empire. But the public interest in architecture is evidenced by the quality of the designs they appear to be contented with, and is exemplified by the numerous extraordinary conceptions seen in our streets and public places. Nevertheless, there is an undoubted undercurrent of interest in, as well as growth in knowledge and appreciation of, artistic architecture, which is fostered by many of the artistic and building journals. These reflections cause one to consider how it is that, with all our increase of knowledge, all our growing interest in art, and all our opportunities of study and travel in other countries, our streets should be so replete with staring incongruities, uglinesses, ignorances, and want of refinement.

Reason Why Bad Architecture Exists.

One cannot help feeling that the following have been some of the reasons of this anomaly:

MR. WILLIAM EMERSON, PRESIDENT R.I.B.A.

been one also of unprecedented advance in all branches of learning, culture and science. It has also been marked by many indications of a revived interest in architecture.

This interest seems, however, to have been confined mainly to individuals, or small associated bodies of cultivated architects, archaeologists and artists. In fact, since the Renaissance in England, which followed hard on the heels of that in Italy, architecture seems to have been steadily on the decline. The strong classical movement in the earlier years of the century, and the enthusiastic outburst of Gothic revival later on, were, however, indications of the existence of some amongst us who recognised the importance of a fitting national architecture being evolved if our

(a) Ignorance and want of proper education of the public and the architects in artistic matters; (b) lack of public interest in the subject, causing unwillingness to spend money on architecture, and the mercantile desire to build as quickly as possible, in order to avoid pecuniary loss from rent or otherwise; (c) lack of control by competent educated authorities, either governmental or municipal, or estate agency, whereby at least the erection of palpable architectural enormities might be prevented.

In regard to (a) and (b), degeneration in architecture may have set in with the dying-out of the art and craft associations which in former years, both under the Church and guilds, exercised authority in architecture and

art knowledge, and so carried out many of the important buildings in almost every country. These guilds handed down from father to son in successive generations what was known of the arts—as, in fact, takes place in the East at the present time.

This system died, and with it the traditional art knowledge declined. Coming to our own times, undoubted improvement in regard to education in art is taking place every day. The Royal Institute of British Architects' examinations now promote study on the part of the rising members of the profession, while the education of the general public is so many-sided nowadays that even architecture claims some attention. But it is the third point, as to the desirability of control in respect to the design of our new buildings, to which I wish mainly to draw attention.

Could ancient Rome ever have developed the magnificence in architecture that its works reveal had there not been some sort of control over the artistic as well as the constructive side of their buildings? If Augustus boasted that he found Rome of brick and left it of marble; and if the magnificence of Vespasian, the genius of Trajan, and the cultivated taste of Hadrian conceived and accomplished the noble works of their reigns, they evidently exercised a certain control over the embellishment of the imperial city. History tells us that it was the duty of the Pro-consuls in ancient Rome and the provinces of the Empire to supply the deficiencies of the citizens in their building operations, to direct their taste, and sometimes to moderate their emulation with one another. The emulations of our citizens scarcely require much moderating in this respect now. The Romans were, however, apparently uncontrolled in regard to their private houses, and the modest simplicity of these proved their freedom in this respect.

The Buildings that Need Control.

In our day it is also not so much in private dwellings that artistic control seems necessary as in semi-public buildings and business houses in our streets. During the Renaissance public taste and opinion had a controlling influence over architecture and art, for even the production of a new statue, if fine, was made the occasion of public ovation and rejoicing.

Public taste and opinion now have but little influence; but the necessity of some competent control over the art of architecture is felt not only by many in England, but also in all parts of the civilised world. And as a proof of this feeling in France, a book by a French architect, M. Gustav Kahn, is now, I understand, being published on this very subject; also the matter is to be discussed at the International Congress at Paris. Most countries have control over the designs and construction of their public, governmental and municipal buildings, but over private buildings facing on public streets and places it appears that in no country is there any other control than that affecting constructive or hygienic matters, or widths of streets and general heights.

The question is how some efficient control—affecting not only the constructive, but the artistic design of public as well as private buildings—could be obtained, and whether or not such a control would be advantageous.

French Methods.

In France (to quote the words of our late secretary, Mr. William H. White) the Council of Building in Paris, the principle of which was first initiated by Colbert in 1663, has existed in some form or other since his day. In 1798 this Council, under another name and in altered form, took for a time the name of "Assemblée Centrale des Architectes," and consisted of seventeen architects. Later on a Councillor of State was appointed president, but the vice-president was always an architect. In 1838 this Council was extended to twenty-four in number, of whom fifteen were architects, and their duties were increased. The members of the Council were not permitted to design or execute new works under the administration. They had the final judgment as to designs submitted in competition for public buildings. They also advised as to the selec-

tion of architects for new public works; and since then this Council has had the supreme control of all public works, there being numerous divisions—which I need not now go into—for the efficient control of the various departments of works. All were placed under the charge of a minister at the head of the *Maison de l'Empereur et des Beaux-Arts*. The responsible chief of each division of public works was advised by committees of experts. I believe, unless any alteration has been made lately, the functions of Supreme Director of Works are divided between (a) the Minister of Public Instruction and Fine Arts, (b) the Minister of Justice and Public Works, (c) the Prefect of the Seine, and (d) the Prefect of Police. The Minister of Public Instruction and Fine Arts, the Minister of Justice and Public Works, and the Prefect of the Seine are all advised in the matters of architecture and building by councils or committees, of whom a large proportion are architects. The Prefect of Police, whose duties are mainly in connection with the safety of the public in respect to buildings in public streets, &c., is assisted by a number of architects, the Inspectors-General being men of high distinction in the profession.

This systematic organisation has been responsible for some of the best and most beautiful buildings in Paris, and appears, in respect of public edifices, to give satisfactory results; it has undoubtedly influenced the national architecture of France. This control is exercised always over a design for a building which has to be carried out with the aid of funds contributed wholly or in part by a public body; but in France, when it is a question of private buildings, the control of municipal authorities is only extended over such matters as widths of streets, heights of buildings, and hygiene, but in no way over artistic matters. In fact, M. Lucas informs me of a case some years ago proving how little voice the authorities have in such matters. The story is as follows: A house-owner at Chantilly, wishing to force the owner of a house situated opposite his own upon the public road to quit the district, painted the façade of his own house black, with death's-heads and cross-bones picked out in white. This led to a series of actions and appeals in courts of law, with the result in the end that the owner of this grisly façade had to wipe it all out and repaint it in the usual manner. But the judgment had nothing whatever to do with the question of art in regard to street architecture, or in reference to public taste, but solely on the ground of damage done to his neighbour by the hindering of the letting of his premises.

German, Austrian, and Danish Methods.

In Berlin, and Germany also, though I believe there is Government control over public buildings, and though there are building regulations and legal restrictions in the matter of private construction of buildings, these have nothing to do with æsthetic considerations. Every proprietor has a right to occupy his property with buildings or alter his buildings, but no building is permitted to the damage or the insecurity of the public or the disfigurement of towns or open spaces. In regard to the word "disfigurement," in legal proceedings which have been taken to prevent the erection of unsuitable edifices the judges have invariably dismissed the cases, on the ground that matters of taste are purely individual. But I am informed by one of the leading Berlin architects that this defect is felt very much and will shortly be remedied, for counsel is being taken as to the scope of such legal restrictions. This matter, which is under consideration, can scarcely be brought to a conclusion this year.

In Austria I find there is no control over new buildings in respect of their æsthetic properties—only over construction.

In Denmark there is also no control over taste or design—only in construction and other kindred matters; and the lawyers there strongly uphold the unlimited right of an owner to build whatever he pleases, provided it is in conformity with the law. But the disregard of the public's just claim for beauty of design has been severely censured in the

ELEVATION IN NEWGATE ST

SESSIONS HOUSE. DESIGN BY EDWARD W. MOUNTFORD, F.R.I.B.A.

Common Council of Copenhagen; and the opinion expressed there has influenced the magistracy to such an extent that now in most deeds of conveyance whereby the community sells land for building purposes the stipulation is made that the drawings for the exterior of their buildings are to be submitted to the magistracy, who then seek the opinion and advice of the city architect, and generally decide according to his advice.

To this scheme there are many drawbacks. When the community is the greatest land-owner, as in Copenhagen, it may affect many, if not most, of the buildings; but even then, when incompetent architects are chosen by the building owners, and the design is submitted after the sale is completed, very little can be gained by the alteration and correction of unsatisfactory drawings, or by the absolute refusal of them; and their approval, if the alterations, as is usually the case, involve more outlay of capital, naturally raises objections on the part of the building owners. Were it possible for the designs to be submitted previous to conclusion of the bargain for the land, a much more effective control over the design could be exercised. Lately this has caused a movement for a revised building Act, which shall have clauses giving power to the building commission to refuse consent to the carrying out of a design that would disfigure the street or place in which it is to be erected. But whether such a clause will be carried is uncertain, for there again the question must arise as to what disfigurement entails or means.

Regulations in Italy, Russia and America.

In Italy control of buildings is a municipal affair. Each city elects a council, called the "Commissione Edilizia," whose mission is to examine every building project, whether for a new construction or for an alteration to an existing structure, and to uphold the interests of the public from the standpoint of beauty. They have to examine the plans from an æsthetic point of view, and if in their judg-

ment the execution of the project would disfigure the city they are bound to refuse their sanction to it. This committee, the "Commissione Edilizia," has also the power to grant exemption from the building regulations in case what is termed the "ornato pubblico" should require it; for instance, in the matter of heights. The Pope's Government has always desired to go one step better to secure improvements in the aspect of the city. Leo XII. granted that whoever should build, or rebuild, or restore, a house from designs approved by the St. Luke's Academy of Fine Arts should be exempt for thirty-three years from an increase in property tax—a most just and wise measure for the encouragement of citizens to erect handsome buildings.

In Russia I learn that every governing institution has its own building officer and architects, who are responsible for their buildings. The latest innovation is that designs for all important buildings requiring artistic skill shall be examined by the Council of the Academy of Art; but until now many exceptions are made to this rule, and, in consequence, I am told that barbarism often reigns in many of the buildings.

In America, in New York and Boston, art commissions exist, consisting of persons appointed by the mayors, and of those who hold positions at the head of certain public institutions, and the law provides that no work of art shall be accepted by the city government or erected in the streets or public places without the approval of the respective commissions. This applies, however, more to fountains, statues, monuments, and such like, than to buildings, excepting that within certain limits a building paid for by public funds may be altered, modified, or controlled by the commissions.

It seems, therefore, that Italy alone has any real control in the public interest over the artistic design of buildings, and this is exercised by committees in each city.

A Growing Desire.

There can be no doubt that in England, as

well as in all other civilised countries, great and important steps have been taken of late years in the direction of control over building operations in matters affecting the public welfare, such as constructive details, hygiene and sanitary questions, and possibly it is to be expected that these should take precedence over matters of taste and beauty. But the more educated public seems now to be justly discontented with the effect of many of our buildings and the way in which town improvements and public works are conceived and carried out; and there is no doubt a growing desire that some sort of control as to the æsthetic side of architecture should be exercised by competent authorities, at least in respect of our public streets and places. But how to exercise such a control is a very difficult question. So long ago as the year 1881, when the late Mr. George Edmund Street was President of this Institute, he drew attention to a number of flagrant cases of mismanagement in regard to our national monuments, and to the selection and arrangement and laying out of certain public buildings, bridges, streets, and their approaches, and he then argued that all pointed to the necessity for the creation of a Government Ministry of Fine Arts, which should have a supervising eye and control over all our national monuments and collections, and also over new edifices, city improvements and re-arrangements. The late Lord Leighton stated that much might be said in favour of some scheme for checking the production of ugliness in this country, but feared that many and grave difficulties would beset the carrying out of any such scheme, and I have reason to believe that one of the chief difficulties he saw was that, in the event of such a ministry being established, and having by chance a dictatorial head, it might eventuate in one man's architecture, resulting in a monotonous effect in our towns.

This subject constantly recurring and attracting the notice not only of architects, sculptors, and artists, but also of some of the educated public, seems to show that it is a measure which must eventually find its way into practical politics; and surely, as it is of Imperial interest and would undoubtedly be for the good of the greatest number, it ought to do so.

Pros and Cons.

Let us consider for a moment some of the points for and against such a high authoritative control. A few of the points in its favour would be:

I. That such a controlling body, composed of fully qualified men of artistic perception, would prevent the erection of new public buildings, such as our Law Courts and the Admiralty, on sites insufficient, not only as regards the requisite accommodation, but as regards æsthetic effect, in the interest of what the Italians call the "ornato pubblico."

II. That the laying-out of open spaces, public places, and their approaches would be considered by properly qualified and competent experts and judges, rather than, as is often the case, by incompetent persons, often under the orders of uneducated tradesmen who for the moment may fill the seats of our councils, vestries, or local governing bodies.

III. That such schemes as the two bridges at Blackfriars, erected on totally different principles and lines, within a few yards of each other, would be rendered impossible, and, when necessary, proper designs for new bridges—engineering and architecture going hand in hand—would be assured.

IV. That when schemes for new streets, &c.—such as the Strand improvements lately before the public, or the Northumberland Avenue, or Charing Cross Road, or Shaftesbury Avenue—were under consideration some general plan and design would be arranged, and the talent of our best men obtained, under fair remunerative terms, and they would be responsible to such a controlling power for the proper carrying-out of the architecture of the scheme, and tenants would be unable to erect whatever ugliness and incongruities their uneducated tastes might prompt.

V. That the taste of the public would gradually be elevated and improved, and the

man who wished to disfigure the town for selfish ends would be reprobated, and eventually our town architecture would become the glory of our nation, and architects who were not artists also would gradually cease to obtain work.

VI. That the more education increases, the more a definite control of some sort seems necessary, because posterity has some interest and right in the taste of its forefathers, and we should build not only for the present, but for the future.

VII. That such a control need not mean, under a properly constituted Ministry or Commission, monotonous uniformity of design—one man's architecture; but the juxtaposition of inharmonious designs, materials, and colours would be prevented, and a general harmony with plenty of variety might be ensured.

VIII. That at present architects' powers are often limited in dealing with strong, self-willed, and selfish clients who have no feeling for the fitness of things and are deficient in taste, which should not be the case. For example, should an architect refuse to erect a huge stone building apparently entirely supported by plate-glass windows for such a client, he would be punished by losing the work, and some less conscientious person would unhesitatingly do it. Such a thing would, under control, be out of the building owner's power; the architect would be able to say, "Such a design would not be able to pass the Ministry of Fine Art; therefore it is useless my attempting it."

The Opposition that would be Encountered.

Some of the points that might be urged against such a control are:

I. The politician would probably say this would be collectivism as against individualism, and would interfere with and limit the rights of owners in regard to their properties, and, on the ground that there is no accounting for taste (*de gustibus non est disputandum*), might have some show of reason on his side. But if this were for the national good in matters of taste I cannot see that it would be worse than interfering with freedom in construction and hygienic matters for the good of the public safety and health.

II. It would be urged that it would increase the difficulties of letting land for building purposes in the endeavour to force a tenant to carry out a certain design; but were it the general rule such a complaint would soon cease, and the inevitable would become the good.

III. At present many boroughs and corporations give their architectural work to their engineer or surveyor, and therefore would object to this control. Often these men are quite incompetent for the proper carrying-out of such buildings; but as the arrangement saves an architect's fee the public love it, and the ratepayers vote for it, in their ignorance not understanding that eventually they will be the sufferers.

IV. Some architects might raise objections to such a control as involving the trouble of getting their designs passed, not only by one set of authorities on constructive and other matters, but by another body on the ground of "ornato pubblico." (I use the words for want of an English phrase equally expressive). This might be a serious difficulty to many who profess to be architects without possessing the needful artistic taste. That class would die out under such a régime.

V. The ratepayers would object to it as adding to taxation; for such a controlling body of experts should be highly remunerated.

VI. Then, again, it may be urged that it has never been the custom to interfere with personal tastes in regard to building on private property, though in our public streets and thoroughfares.

But though custom has been against such a control it may have been merely the antiquity of error, as Cyprian said in speaking of custom, that the fact of its being the custom is no warrant for its existence. The increasing aggregation of population in large centres needs increasing regulation in all matters of

public and social interest; and if customs have grown up of which time has proved the folly, then, however ancient, let them be eradicated.

There probably are many other points both in favour of and against such a control which could be pointed out. But on the whole it seems to me that if the larger considerations of public education, culture, Imperial demands, and our national character and taste as it will appear in the eyes of posterity, are weighed in the balance of common sense with the smaller considerations of individual right in matters of taste or property or greed, cost to ratepayers, custom, or inconvenience to the inferior architect, the latter will easily kick the beam.

The Controlling Body.

But were such a control established, the question arises, How should such a body be constituted? Clearly there should be a responsible head of the department, were he a Government Minister or not, and he should be chosen not only for his administrative or political capacities, but for his known possession of cultivated taste, large Imperial ideas, and love of art, combined with practical common-sense; and he should not have the power to overrule the decision of the committee over which he would be president.

It goes without saying that the committee should be formed of the best men amongst our Royal Academicians, Royal Institute of British Architects, and other artistic societies. The view of a majority of such a council should be final in all schemes, public or private, which affected the "ornato pubblico."

For our Metropolis, in which the whole Empire is interested, such a controlling body should, I imagine, be a Government Ministry of Fine Arts; while each provincial town or county council should have the right to elect their own committee. I suppose each such body should be paid from rates raised in the district over which they exercised control. But these are details apart from the large general question of necessity for control.

These suggestions, however crudely put my ideas may be, please to understand I have made solely with the view of eliciting discussion, and with the sincere hope that our governing authorities at no distant date may see their way to inaugurate the new century with some project whereby the future architecture of our country may not be left to mere chance or the caprice of irresponsible individuals; but under a wise control the architecture of the greatest Empire the world has yet seen may not in the future have to suffer by comparison with that of other civilised countries of the present times, or, indeed with that of nations of bygone ages.

The Discussion.

Sir John Taylor, of H.M. Office of Works, said that for years past he had been connected with the control of national buildings, and, whilst sympathising with the suggestion made by the president, he had grave doubts whether it would be any improvement on the method that the Government had adopted with regard to new official buildings—that of availing themselves of the advice of the Royal Institute of British Architects. In reference to the statements made that the Law Courts and the new Admiralty buildings had been erected on insufficient sites, he said the site for the latter was quite sufficient if properly used, and he drew attention to the fact that buildings of this class had primarily to serve specific practical purposes, their architectural merit being a secondary consideration.

Mr. William Woodward, A.R.I.B.A., F.S.I., could not agree with Sir John Taylor that the tribunal proposed would differ very little from the present custom in relation to the Office of Works, for it would include not only the governmental buildings, but the whole of those in the main streets of the city. If the site of the new Admiralty buildings were sufficient, certainly the artistic merit of the building was far from satisfactory. Had there been a tribunal such as that proposed, could it be thought that such eyesores as the railway bridge at the foot of Ludgate Hill, the King's

NEW SESSIONS HOUSE. DESIGN BY JOHN BELCHER, A.R.A., F.R.I.B.A.

College addition, or the Queen Anne's Mansions would have been permitted? He spoke strongly against the railway companies, and said that they had done more than anyone to disfigure London.

Mr. William Young, F.R.I.B.A., joined with the preceding speaker in declaiming against the railway companies, who were the greatest sinners of all, and gave it as his opinion that control, if obtained, should be imposed as little as possible on the architects themselves. If we established the position of Minister of Fine Arts individually in design would be hampered, and there might come a time when the minister in power would be a one-man minister, and that would be most undesirable.

Mr. E. W. Hudson, A.R.I.B.A., F.S.I., thought the president had struck the right note when he said there was no accounting for taste. What was taste? and who was to decide when the doctors disagreed? Regent Street was an example of controlled architecture—but were we to take it as a model? In his opinion it was variety that gave charm.

Mr. Z. King, F.R.I.B.A., referred to the fact that in Nuremberg it was stipulated that when an old building was pulled down the one erected in its place should possess the same character, thus preserving the beauty of the architecture.

Mr. Hippolyte J. Blanc, R.S.A. (Edinburgh), feared it would be most difficult to control the architecture, and he looked for a cure in the education of the public. He suggested that the tribunal should consist of architects and laymen, and should advise rather than dictate; but he would not include painters.

Mr. Ernest Day, F.R.I.B.A. (Worcester), appreciated the proposal of educating the public in architecture, and said that good work in this direction could be done in our schools and institutes; while Mr. F. R. Kempson, F.R.I.B.A. (Cardiff), agreed with Mr. Blanc's views.

Mr. Joseph Smith, F.R.I.B.A. (president of the Sheffield Society of Architects and Surveyors), supported the president's suggestion. No one was satisfied with the present régime, and though we had considerable control in many ways we did not possess it in regard to the design side of architecture. To place the control in the hands of local authorities as at present constituted would be a mistake, for they had often approved designs which were simply monstrous; but a selection of men of taste might be made with good results.

Mr. Arthur Cates, F.R.I.B.A., F.S.I., gave it as his view that however desirable the president's aim was, under existing circumstances it was somewhat Utopian. If the

history were written of the Government buildings in Whitehall, he said, it would be one of wasteful economy and profligate parsimony, and he agreed with Sir John Taylor in his *apologia* for the Office of Works, which was not alone answerable for the existing short-comings.

In replying to the foregoing criticism, Mr. Emerson said he had been somewhat misunderstood, for he meant his remarks to apply particularly to the buildings in the public streets. He felt sure that good would result from the establishment of such a committee as he suggested; but if it had only power to suggest and no authority to enforce its suggestions, little improvement would be effected.

THE CONVERSAZIONE.

On Monday evening a largely attended *conversazione* was held at the Guildhall, an ideal place for the purpose. The Guildhall itself, which was tastefully decorated with palms and flowers, presented a very animated appearance. Here, for more than an hour, Mr. and Mrs. Emerson received a continual stream of guests, who included most of the best known architects in London and many

from the provinces, with their wives and other lady friends. Music was provided at intervals throughout the evening by the band of the Royal Artillery. In other parts of the building there were other attractions; many wandered into the picture gallery, where the loan collection of pictures is still on view, others attended a capital vocal concert in the Council Chamber. In the library rare books and MSS. were displayed, and in the corridors and lobbies there was a collection of architectural drawings, including the designs for the new Sessions House, which were examined with much interest. The crypt was converted into a refreshment room, and in this, as in other departments, the comfort and enjoyment of visitors was liberally catered for. Altogether the affair was a great success; it is estimated that at least 1,500 visitors were present.

COLLABORATION OF ARCHITECT, PAINTER AND SCULPTOR.

On Wednesday morning the third meeting of the General Architectural Congress was held to hear and discuss papers by Mr. Edward W. Mountford, F.R.I.B.A., Sir W. B. Richmond,

THE COURT ROOM IN MR. BELCHER'S DESIGN.

K.C.B., R.A., Hon. Assoc. R.I.B.A., and Mr. E. Roscoe Mullins, on "The Collaboration of the Architect, the Painter and the Sculptor." Mr. William Emerson, President R.I.B.A., was in the chair. The first paper was read by Mr. Edward W. Mountford as follows:—

For some considerable number of years it has been the custom at meetings of the Royal Institute of British Architects, when we are honoured by the presence of eminent representatives of the allied arts willing to give us their valuable opinions upon matters of mutual interest, that an architect should produce a kind of brief preface or introductory note. This explanation is undoubtedly necessary to account for my having ventured to accept the invitation of the Congress Committee to address you on a subject upon which I have no kind of claim to be considered an authority.

The collaboration of the architect, the painter and the sculptor is not only a matter of great importance, but one which is daily becoming more and more deserving of our consideration. There is reason to believe that the public—or, at least, the more educated part of it—is awakening to the fact that good art is both desirable and attainable in our buildings, and that even though this may increase their cost the money is well invested.

The art of architecture is not to be considered as dependent for its perfection upon the assistance of sculpture and painting, as some would have us believe. It is well known that many of our most admired ancient buildings are destitute of either, and the work of our greatest living architect is conspicuously free from any such assistance. Colour of the most beautiful kind may be obtained from the materials used in our work, and it is quite possible to invest buildings with some interest and richness of effect without calling upon the sister arts.

But we shall probably be perfectly agreed upon the great desirability of inviting the aid of our brethren of the brush and the chisel to beautify and embellish our buildings whenever it is possible to do so—which means, in the first place, when it may please our clients to provide the means. This is still one great difficulty, because we must have really good sculpture and fine painting, and, like most other good things, these are expensive. It is the unhappy fate of most architects to have their designs and intentions very much cramped or cut down by the want of the necessary money to realise them; and we have to be content to keep our buildings absolutely plain because bad pictures or bad carving defile a building, and must be shunned like other sins.

Supposing, however, that we have been entrusted with the erection of a building for which there are ample funds, so that we may with a good conscience invite an eminent sculptor and an eminent painter to help in making it as beautiful as we know how. Then we begin to understand that there is some enjoyment in life after all, and we proceed to our work with even more than the usual enthusiasm. At the earliest possible moment—that is to say, so soon as the first rough sketches are completed—we shall desire to consult our chosen fellow-workers; and from that time until our joint creation stands accomplished, the more frequent our intercourse the better for our building. It must not be forgotten that

The Building is the Thing,

and that the architecture is not to become a mere background for the painting or sculpture; they are means to be employed for giving additional interest and beauty to the building, explaining its purposes, its uses, and its history or the history of its builders, becoming part of the architecture itself, and not to be thought of otherwise.

The work of the sculptor and painter in relation to a building bears some resemblance to the illustrations of a great book, of which the architect is the author; and just as the illustrator of a book must make himself acquainted with its contents and the intentions of its author, so should they enter into the scheme of the architect and help to make his meaning clear. As some books do not

require illustrations, while in others they are of great importance, some buildings are complete without the painting and sculpture which in others strongly appeal to people who are quite unable to appreciate the architecture, and take no interest in it. The resemblance is certainly by no means perfect. An architect in consultation with the sculptor and painter will provide in his buildings fitting opportunities for their work, plain spaces for frescoes or sculpture, or niches for statues, and will, if necessary, arrange or modify his detail to meet their views. Harmony of purpose and oneness of interest between all three artists is absolutely essential, or the work must suffer. It seems to me possible that the architect and sculptor may have more in common than the architect and the painter, working, as they both do, in the round; and though colour also enters largely into the work of an architect, it is not usually the colour of the painter. In any case there must be harmony of style and purpose, and not less essential are breadth and simplicity. These latter qualities have been so much spoken of, written about, and discussed lately, that one feels it necessary to apologise for again mentioning them. But important as they are in all designs, they are even more so in connection with this subject, so they must come in again. How many buildings have one seen spoiled by over-much carving, often poor stuff that has no meaning, except to cover the poverty of the architecture; but even of good work it is possible to have too much upon a building. It is not difficult to spoil an interior by too much colour decoration, be it painting or mosaic. Without

Complete Sympathy

with the architect, a painter may, no matter how great his skill or how good his intentions, do much to spoil a work of architecture either by concealing features the architect may wish emphasized, painting out the construction as it were, or emphasizing others which the architect would prefer to have left in modest retirement. The appearance of mouldings may be quite altered by their treatment in colour, or spaces which were necessarily left plain for the desired architectural effect may be painted with a design, possibly very good in itself, but quite undoing the intention of the architect.

It is not for me to suggest here anything as to the manner or methods of the painter. Every architect will have his own views as to the decoration in colour of his own building, and would fully explain them to the painter entrusted with the work. Very possibly these views may be quite mistaken, and the painter, if able to convince him of this, is rendering him a very great service. May I say that to me the pictorial treatment of a flat ceiling seems a great waste of sense and skill? It is not usual in good society to lie upon the floor, and yet this is the one position in which a ceiling so painted can be properly seen. Even then the positions of any figures in the painting are impossible and absurd, unless the painter has represented them flying in mid air, with the soles of their feet and other portions of the body not usually seen made unduly conspicuous—which treatment, however skilful, is hardly pleasing. It is hardly necessary to maintain that a painter, by bringing atmosphere into his mural work, treating his subject in a thoroughly realistic manner, simply destroys the architecture. Happily most English painters understand decorators' work too well now to do such a thing, except in specially prepared panels. A considerable amount of conventionality must be employed.

With the sculptor the architect has to discuss, not only the subjects of his work, but the materials, the scale, the amount of relief, and even the jointing of the stone. The small scale models which the sculptor will prepare may be most usefully extended to embrace as much of the surrounding architecture as possible, and the architecture will probably greatly benefit if this course be followed.

Sculpture

I regard as being much more a necessity for

important buildings than colour decoration, which is rather a luxury seldom to be attained. Moreover, being much less appreciated by the general public than painting the cost is less. Probably to every hundred people that are "fond of pictures," less than twenty take any interest in sculpture, and certainly not more than five care anything about architecture. And the Royal Academy, as well as Her Majesty's Ministers, exactly reflect public opinion in this respect, which accounts for many things.

There is one small point with respect to the use of sculpture, which is worth a little consideration. It is not unusual for a statue, large or small, to be placed upon the summit of a tower or the apex of a lofty gable, but the result is often not happy. A plain moulded terminal would generally look better and cost a great deal less, while the money so saved could be used with much better effect upon some less elevated part of the building. My objection does not apply so much to figures placed along the parapet of a building of moderate height, which can be seen only from the front, although even here a background of masonry is better than one of sky. But isolated figures at a considerable height from the ground nearly always look unsatisfactory from at least one point of view.

As regards the use of both sculpture and coloured decoration, I have a strong suspicion that many of the old buildings of Italy and elsewhere that we now so justly admire must have aroused quite different emotions in us had we seen them when fresh from the mason's hand.

In conclusion, may I be allowed to express my appreciation—which is shared, I am sure, by all architects—of the manner in which Sir William Richmond referred to the art of architecture in his recent speech at Bath? It would be well for all kinds of art if his opinions were more generally held, and one cannot but wish that his fellow Academicians should read and understand all that he said.

Sir W. B. Richmond's Paper

succeeded that by Mr. Mountford, and was as follows:—A paper written to be read in ten minutes should, I think, be both terse and suggestive; it certainly cannot pretend to be exhaustive. Its object should be the promotion of intelligent, even warm, discussion. If this paper is abrupt in its transitions as well as in statement of my views, the foregoing reasons must be my excuse for such defects. We all desire closer union than now exists between the three great arts, as well as a more intimate conjunction with them of the lesser arts and crafts.

It is the wish of all of us that the spirit of the true artist should preside over all our labours, great or small—a spirit which induces spontaneity of design, and which prompts sincere endeavour to carry it out with clearness, which shall be the expression of ourselves, and therefore with style. Style is what is wanted, and is so often absent—the impression of the mind and the hand of the artist. Of "styles" most of us weary; their use, more often than not, implies absence of invention, and is but an attempt to revitalise corpses. Rather than follow them ought we not to be bound by the requirements of our age?

The collaboration of the architect, sculptor and painter ought not to be difficult. To be successful the architect should not interfere with the sculptor or painter, *qua* their designs; this he will not need to do if his style is his own, for if they are true artists, all of them, they will give and take according to the requirements of their arts as well as of each other's art. They will each respect the other's province, that of the architect as the designer—or builder (as Wren is named upon his tomb)—of the structure, of the sculptor as the designer and carver of effigies, ornament and their attendant parts, of the painter as the designer and executant of the pictures, their borders, &c., and their colour scheme.

But both sculptor and painter must give way to the architect upon matters of scale, of proportion of part to part, so that their work shall be harmonious in scale with his; of quantity; of projection whether in the round

or relief; of the fairness or depth as to tone, of the painter's scheme. So will they labour in harmony.

While architects insist upon

"Styles"

they will get no first-rate sculptors or painters to aid them or to work with them. For the adornment of "styles" they have to continue to go to "firms" where they can be provided with as many shams as they require, all quite lifeless and hopelessly out of touch with the movement of this, or for the matter of that, with any period, because they do not reflect it. As long as "styles" are abjectly adhered to, art must remain dead! No artists, as far as we know, imitated the work of their predecessors; they wrought in the vernacular of their environment. In recent times Viollet-le-Duc, admirable antiquarian and voluminous writer, has given us an example of the inevitable failure which must attend upon "styles" of decoration in many of the churches of France. Witness his cartoons in the Louvre and its wall paintings in Notre Dame, about which nothing can be said but that they are wholly uninteresting.

Santa Maria Novella in Florence is a nest of anachronism according to the modern standard. The wall paintings there by Cimabue, Gaddi, Giotto, and Ghirlandajo, and by later painters also, are side by side. Ghirlandajo did not paint in the style of Giotto; he painted as his period dictated. The west circular window contains glass of the early fourteenth century; the west window is late fifteenth in the style of its period. Side by side are monuments which date from the fourteenth to the seventeenth centuries in the style of their period. So the Church, as it were, breathes history from its walls; its monuments and paintings are sincere demonstrations of their authors' originality and spontaneity. This is one instance out of hundreds which might be brought forward that proves the universal law that no art is really valuable which does not emanate from the spirit of the period which gave birth to its author. It is because of its sincerity of purpose that art interests us. Fancy Ghirlandajo decorating the portion of the church assigned to him after the manner of Giotto, or Giotto in that of Cimabue because Cimabue painted on the walls of the church at the time of its erection; they would not, could not, have been such slaves to pedantry. As soon as architects

Design Original Buildings—

which, by the way, here and there they do and there are many examples in London, irrespective of severe canons of proportion and orders, but structurally consequent and individual—they will find plenty of sculptors and painters to work with them; but as long as they design in "styles" no original men will be slaves to them: they must continue to get the adornments for their structures from "the trade." Is it not a mistake to specialise early? The young painters—indeed, the old ones also—know nothing or little about architecture; nor is the young sculptor made aware of the position that he ought to hold in relation to spaces. Neither does the architect get a chance of working in conjunction with sculptors and painters, who should be his colleagues in his earliest days of training. They are brought up separately; and they remain separate, consequently neither their interests nor sympathies are current.

Finally, of course, the architect is the responsible person; therefore he should be a thoroughly equipped artist. Would it not be possible to avoid too early specialising? How few architects there are that know anything at all about colour! How few painters are even indirectly interested in architecture, and how few sculptors learn to be an attendant upon architecture! And what a loss it is to each that he is so ignorant of his sister arts!

The great men of past times were rarely specialists. Every one knows that Giotto was painter, sculptor, and architect. So was Raphael, so was Brunelleschi, so were Michael Angelo and Leonardo. Phidias was the son of a painter, and was educated in that craft; Ictinus was a sculptor as well as an architect.

SIR WILLIAM B. RICHMOND, R.A.

I suspect they worked harmoniously; and no doubt whoever designed the colour scheme of the Parthenon did so in conjunction with his colleagues.

The well equipped designer is able to cover a large field of action. If he can design in one material why not in another? None of the techniques are so enormously difficult, either of building, carving or painting, that they cannot be acquired by patience, *given the artistic temperament*. It is the artistic use of techniques acquired by experience which succeeds, or the reverse, in exact relation to the quantity of intelligence and judgment that have been put into it.

Our Age is One of "Harking Back"

—archæological more than creative. Certainly this applies to architecture. But in the arts of painting and sculpture such a term applies with far less accuracy; the best work being now done in them reflects the spirit of our time. Do the majority of our buildings do that? Does the Tower Bridge, for example, reflect our time? When architects do so the sculptors and painters will almost automatically come into touch with them, and the crafts also with them.

To reiterate: no original designer, painter, or sculptor would execute in the thirteenth, fourteenth, fifteenth, or sixteenth century style to satisfy the pedantry of an architect, though if he had made an *excursus* into any of those styles he might be able to do so; but if he did his work *qua* art and style would be quite valueless. The sculptor *makes* statues, the painter *makes* pictures; they do not design them only. Should not the architect *make* buildings? And, just as the painter and sculptor learn anatomy, should not the young architect be apprenticed to a builder, that he may learn the anatomy of his art and become in the highest sense a builder?

I confess to thinking that art education cannot be commenced too early or be too broad and inclusive. Specialism would follow according to the bent of the student's capacity. Should not a young architect practise decorative painting and sculpture up to a certain point? It could do him nothing but good. And the same principle should, I think, apply to the education of sculptors and painters; early instruction concerning plan and structure could do them nothing but good. Advanced students should, I think, be encouraged to collaborate. Given a model designed in conclave, made by the architect, to be sculptured by the sculptor and decorated by the painter, how interesting such efforts would become! What a stimulus they would give to the three arts! Each student having thus become conversant with the arts of his colleagues would be in a position to criticise as well as to appreciate them. The three arts would thus grow up as it were together; they would not be strangers to one another; the great mother of the arts, Architecture, would take to her children again, who have separated from her, as she has from them, to their and to her privation.

The purist may imagine that Greek temples, early and late Gothic churches, or even early Renaissance, were bald and colourless, but they were not; we know, on the contrary, that they were highly coloured and decorated, probably with what we, with love of faint anemic tints, would call crude colours. And modern buildings may be decorated with strong colours; why not? Crude colour soon tones down if the shades are harmonious.

Purity and Form.

Purity does not reside only in form; form is not its only exponent. Colour can be rich, splendid, strong, and yet be chaste. Chastity is not weak and anemic, it is the sign of

MR. E. ROSCOE MULLINS.

vigour and strength. Sculpture may be coloured even vehemently; painted woodwork, marbles, gold and other metals, can be introduced lavishly without one jot of purity being injured. But such a revival cannot come all of a sudden; we have to become used to experiments: these may be uncommon, unconventional, and, as such, they must take time to become established in and recognised by the public mind.

We have the material, minds and matter for the most rich and splendid work, but upon account of the divorce of the three great arts and of the crafts from them, more or less, that material is only serviceable within a narrow range and under unduly restricted conditions. Once get young students, architects, sculptors, and painters into touch with one another's art, and a really vital school will spring up with astonishing quickness. Architects will then take their proper position as artists, and sculptors, and painters with them in conjunction. Pedantry and its near relative dulness will cease to exist; painting will no longer be considered as "The Art," and the other two as minors. To the attainment of this end we should, I think, all struggle, an end which means union, wherein there is strength, share in the struggle and help, not hinder, one another's efforts. It is not precedence that any of us desire, but concord, mutual progress, and unity. We are individually striving to render England more beautiful; let us try to do so collectively; let us strike out for freedom, not licence, but freedom based upon the only sound foundation, sincerity, combined with knowledge of the various branches of what after all is the one art.

Mr. E. Roscoe Mullins's Paper

was as follows:—It may well be that a sculptor will approach the subject of the collaboration of architect, painter and sculptor from a rather more stringent point of view than would a painter; for whilst a painter can and does develop his art alone, independently of the other arts, requiring only house room, his art not suffering if so separated, it is otherwise with sculpture. A sculptor, I maintain, is only truly working out his art in its highest conception when he is working in unison with architecture, and is controlled and inspired by its conditions and limitations; and in so far as the willing hand of architecture is not held out to sculpture, the art suffers. The natural and rightful place for sculpture is in connection with or upon buildings, which it should ennoble and beautify by its presence; the treatment of sculpture should depend upon the particular lighting that the chosen position and the surroundings would give it, and much of its shape, arrangement and effect

must be due to the space allotted for its filling.

This is not, I know, the popular view of the art, but that it is the true one a glance at the past great periods would prove. I can only, in the short time allowed me, give this glance, but detailed inquiry would bear out my statement. There is hardly a work of sculpture in the British Museum that is not decorative in the true sense—that is, work that was applied to buildings, executed for buildings, of which the beauties can now only rightly be appreciated by recalling the buildings they were designed to decorate. In the days of the Renaissance it was equally so: Michael Angelo, Donatello, Luca della Robbia, Ghiberti, all collaborated with architects, and their best work was done for architecture. In the Gothic days, too, this truth is equally apparent, which a visit to the chapels and tombs at Westminster abundantly proves. It is only in these days that

The Direct Union

has been lost, and the art has been conceived as standing alone—*freistehende*, as the Germans say—and, like painting, thought to be free and independent. Nothing has fostered this false view so much as the prevailing custom of exhibitions, and I must also add museums, for in both we see sculpture isolated, in no connection with the place it is designed to fill. In exhibitions we accustom ourselves to a standard of isolation, forgetful of the main purpose of the work; that is, its surroundings and the causes of its shape and treatment. This aspect is lost in the æsthetic admiration of the work alone. Decoration in former days did not mean a mere filling up of space by some stone carver or so-called monumental sculptor, but rather the representation by the nation's most gifted sculptors of the stories and legends believed in by the people, and executed in such a manner as to enhance the beauty of their national buildings, and make complete and explain what would otherwise be bare and unintelligible. Such was decoration in the past. How differently in our day is decoration understood, when it has too often come to mean merely endless repetitions of meaningless ornament, as suitable to a tavern as to a church!

To show the evils of backsliding we may note the tendency of sculpture, when separated from architecture, in the particular form it takes at exhibitions, to develop into a species of bric-à-brac and *objets de vertu*, statuettes rather than statues, coloured combinations of assortments of stones and jewels, surface treatments of realistic skin-folds, and often ugly renderings of nature—anything, in fact, but work possessing the properties of true sculpture, which should depend upon breadth and knowledge of light and shade, and simple massing of form. In our Royal Academy the influence of the painter is felt on sculpture instead of that of the architect, and the result is scarcely satisfactory. It is natural that truthfully-modelled surfaces, literal renderings of nature and combinations of colour, would have more weight with a painter than with a sculptor; but in sculpture such tendencies conduce to realism, and the closer the imitation the less is the art displayed. Too often the work, when done, is only suitable to become part of a rich man's collection of isolated treasures, that only the few therefore can possess, rather than fitted to belong to the nation as a whole, as it could do if it were executed for public buildings.

There is one other evil I should like to mention, to which the sculptor is prone if he is detached from architectural control, and that is making the search after beauty as his one aim. To me it always appears that no theory, that has been advanced, has done so much to destroy individuality and original talent as this

Loadstone of Beauty.

An artist who is seeking for beauty alone is as a man seeking for happiness—a desirable end to attain, but never attained by directly planning or searching for it. And it is the same with the attainment of beauty in sculpture; the end is only reached by having some more definite object in view, while the vague search

for beauty only leads to imitation and trite conventionality. Let the immediate purpose of the work, however, be simply the desire to tell a story in the best possible way, and to adapt it to the place that the work is to fill; then the element of beauty will still possibly be there, without striving especially for it, and at any rate the work will be stamped with individuality.

Perhaps the time when least attention was paid to architectural decoration was at the beginning of this reign, when sculpture was represented in this country by Gibson; and his work shows the effete result of a one-sided striving for beauty, that ended in the neglect of nature and the adoption of a pseudo-classic treatment, uninteresting and unmeaning to us Englishmen of this century.

Since that time we have advanced in the right direction, and some of our best sculptors' works can be seen on buildings, forming part of a whole scheme and helping the purpose of the buildings for which they were intended. But though we have moved in the right direction, there are yet misconceptions to remove before sculpture can be fully applied in its true field as the co-mate of architecture. This is brought home to us when we note the one form of sculpture that we may fairly say is tolerated in England—that is portrait sculpture. Supposing we accept this form as characteristic of the nation—and I fear we have not yet risen to things higher—can we say, except in a few instances, that we have succeeded in portraying the individual man? I think not. The very size in which we depict him—I refer to outdoor statues—is sufficient to prevent the sculptor from giving an individual rendering of his subject. He is content if he succeeds in getting a portrait of the face, while to the figure he gives general classic proportions, so that we have individual heads on our statues that would fit equally well on any other statues' bodies and legs. Now, if these

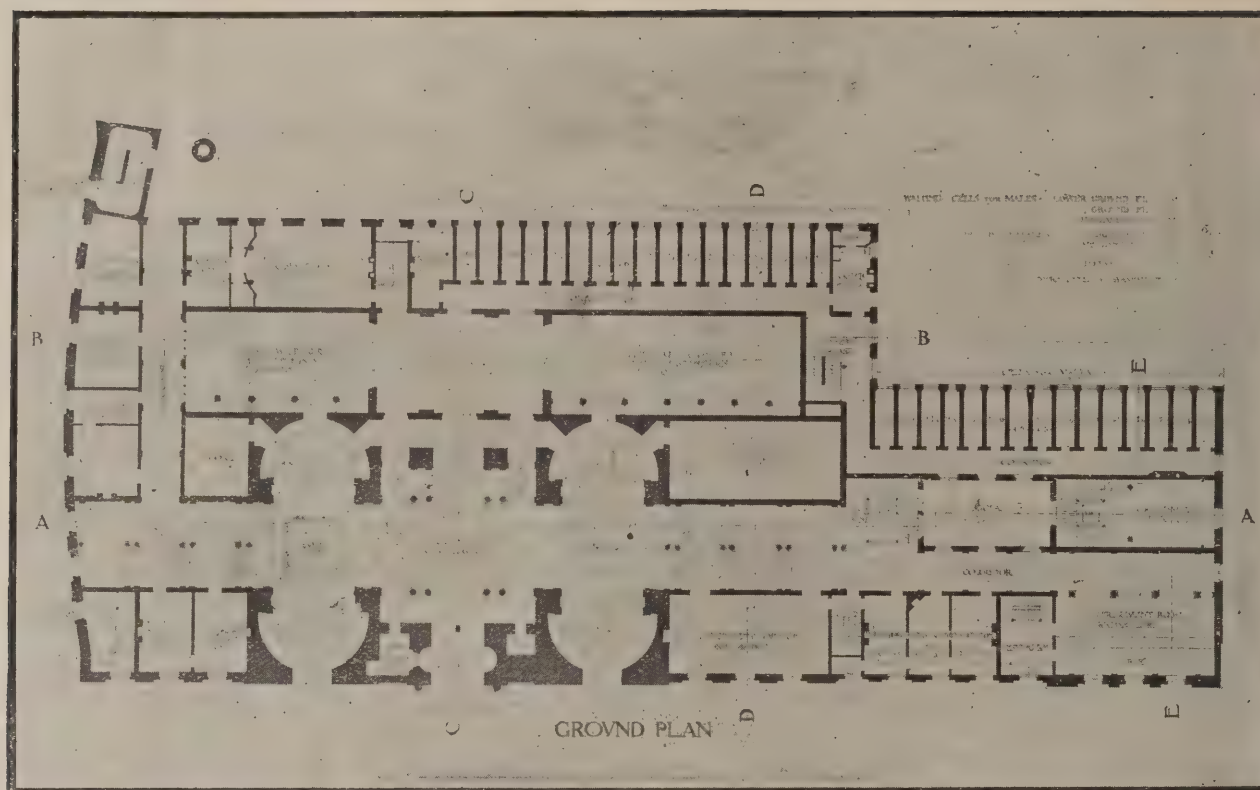

Portrait Statues

had been designed to fill niches or stand in courtyards, or to be placed in front of buildings, of which they would then form part, the size of the statue could be diminished, and attention given to the portrait of the man as he is, or was, not merely in face, but in figure. I maintain that no portrait statue should look more than life-size; it ought, that is, not to strike the observer as abnormal; the extra size that is given should be due only to the necessity of the surroundings, and the height at which the statue is placed. I think the only form of sculpture that will stand the test of isolation is work with strong action, as some equestrian statues, and ideal work that is not subject to the restrictions of modern dress; but even these are improved by a background, at least of trees.

This association with architecture would open other fields where the sculptor's art could assert itself, and where the nation's desire to perpetuate the memory of her great sons could be encouraged. For instance, a Hall of Heroes—a Walhalla—where the deeds of the great could be recorded, and where the whole building could be devoted to that end, would be far more interesting and instructive than is the prevailing custom of thrusting statues, as we do now, into Westminster Abbey and other noble buildings not designed for them, where they are void of meaning, and destroy instead of adding to the beauty of these buildings. In a modest way, too, I think there is room in our cemeteries and churchyards for a happier union of the two arts. Most of the sculpture we see there, besides being commonplace in design, is often vulgarly obtrusive; yet I think a cemetery should be a home for good sculpture, and it could be made so if the sheltering hand of architecture was there, too, to give restraint—a necessary element, and especially appropriate in a place hallowed by the association with our dead.

In so short a paper it would be out of place to enter into matters of detail, and I think, even with unlimited time at my disposal, I should hesitate before laying down any rules or restrictions as to methods of work or treatment of subjects. One might with equal right prescribe the style in which an architect

should build. The only two conditions I consider essential are that the sculpture, whatever its character and wherever placed, should be seen in its entirety, and that the form the work takes should be the suitable one for

The Position ;

not, as in the case of the frieze that runs round the Athenæum Club in Pall Mall, and again over the gateway at Hyde Park Corner, which are copies of the well-known Panathenaic frieze of the Parthenon, but which are placed under quite different conditions of light and position than those that guided the Greek architect and sculptor in their choice of the style of relief.

In decoration the sculptor should assert his own individuality, and not be bound by effete laws of design; there is no other golden rule to follow to insure interest and vivacity—and interest and vivacity are two of the three elements necessary to all true decoration. The remaining element is the sense of restraint alluded to before, for, although the spectator should be conscious of the expression of movement, yet he craves at the same time for repose, and this is added by the restraining force of architectural surroundings. This restraint, instead of hampering the sculptor, really brings out the strength of his art, and shows its manifold capabilities of adaptation to required ends.

To sum up, I have intentionally dwelt upon the advantages accruing to sculpture rather than to architecture in this desired union of the two arts, and have left the gain, that would belong to architecture, to inference only. This I regret the less, as that side of the question has been fully entered into in the wider treatment accorded by the reader of the previous paper. The points I would insist upon are these: that it is against the best traditions of the past to divorce the arts of architecture and sculpture; that this divorce leads to a low estimate of sculptural decoration, as well as to a want of direction and meaning in the sculptor's work; that gallery exhibitions of isolated works belittle the art of sculpture; that portrait sculpture is shorn of its character and truth, which can only be truly given when incorporated in a wide scheme of decoration. For these reasons, therefore, I maintain that a healthy demand for sculpture and a capable and satisfactory development of the art can only be attained by returning once more to the traditions of the past and effecting a closer union of the kindred arts—architecture and sculpture.

The Discussion.

Mr. Selwyn Image, in opening the discussion, referred to the great service the conference would do in bringing artists in touch with one another, thus insisting upon that great principle, the Unity of art.

Mr. Heywood Sumner said that from the architects' point of view, it was of course perfectly true what Mr. Mountford had said, that architecture could stand alone, independent of painting and sculpture, but this wholesome admonition, seemingly thought necessary for the Institute to insist upon, was a mere flourish, and Mr. Mountford had qualified it directly after. Mother Architecture was exactly akin to Mother Earth; no one would dare to say that Mother Earth should not have been enriched with life, nor should architecture be divorced from its life-giving qualities. The wealth of colour in ancient works of architecture had been spoken of. If we saw them as they were originally, we should be overwhelmed with the wealth of colour. If we had in our dress plenty of colour, we should appreciate brightly coloured surroundings. With regard to disputes between co-workers in the arts, they often forgot that in the past the same differences arose. In regard to the statues in Westminster Abbey, he would be sorry not to have them there.

Mr. Beresford Pite spoke with reference to Sir W. Richmond's remarks as to "styles" and "style." As a general rule, to rob an architect of styles was to rob him of language, to reduce him to impotence. Mr. Street had said in

some lectures of his that style was the expression of character—the expression of the artist's feeling rather than the copying of certain forms of architecture. That from a man who was regarded as bound hand and foot to the corpse of Gothic was remarkable. In the century they had had one or two generations who worked in a dead style, but Burges and Street lived themselves into the thirteenth century, and in later times Mr. Bodley had lived himself into the fifteenth century. The enjoyment felt in the work of these men was purely from the same point of view. It was the same in other arts; no one would say that Burne-Jones's paintings were characteristic of the nineteenth century; when their charm was analysed, it was found to be in the reminiscence of the archaic rendering of the Early Renaissance. The difficulty encountered was that they were living in the close of a period of Renaissance, and they could not work themselves free from it. If an architect was stripped of his architectural styles, he was left to his own resources, to his own character. For the past five years they had seen this struggling, and the production of the simple, whitewashed, low-roomed, countryside dwelling. This had resolved itself into the plain town-house of the Magpie and Stump order. The architect had rubbed out everything, leaving only the bare walls and windows, nice as far as it went, but it did not go far enough. But if that architect was to undertake a monumental work, say a national memorial work, he would be bound to go to the Renaissance. Mr. Pite was bound to conclude that the cultivation of architectural character would have to be tried before the cultivation of architectural style from character was attempted.

Mr. William Woodward next spoke, and was followed by Mr. Aston Webb, A.R.A., who referred to the system pursued in building the Royal Albert Hall as an instance of the manner in which architects, painters and sculptors should work together. The fault of greater opportunities not being given to painters did not altogether lie with the architect; the painter had also been attracted by picture painting to the exclusion of decorative painting. It was to be regretted that there was no method of keeping wall paintings permanent, for no art without permanency was likely to call forth the best efforts of artists.

Mr. H. G. Ibberson thought the great difficulty with regard to the employment of the painter or sculptor was the non-appreciation of the public. The general public were like the statement that Nature abhorred a vacuum—they abhorred a vacancy in any part of a building. The public could not appreciate a piece of blank wall, and did not think they were getting their money's worth if the decoration was small but good.

Mr. Geoffrey Lucas, in reference to the question of a man's individuality coming into his buildings, said it was very questionable how much of his individuality a man should put in, for in buildings of the past it would have been impossible, were the names of the authors not known, to have picked out those by each man. Rather should an architect grasp the spirit of the age.

Mr. W. H. Seth-Smith referred to the system of training young architects pursued by the Architectural Association.

Mr. A. N. Paterson said painters were inclined to expect such large payments for small canvasses that they did not care to undertake decorative painting.

Mr. Mountford, in reply, said he entirely agreed with all Sir W. Richmond had said in regard to "styles" and "style," but thought architects must always, to an extent, have the "styles" with them.

Sir W. Richmond, in acknowledging, agreed that the matter rested a very great deal with the public. In reply to Mr. Webb, he had found that for fresco paintings there was a material which could stand: simply the yoke of egg and oil or wine of vinegar.

Mr. Mullins said that he did not wish his remarks with regard to the statues in Westminster Abbey to be taken to mean that he would have any removed.

On the motion of Mr. Emerson, votes of

thanks were accorded to the readers of the papers.

THE IDEAL CITY.

This was the subject for discussion at Wednesday evening's meeting, and it was introduced by four papers, each dealing with the subject from a different standpoint. Mr. E. A. Gruning presided, and there was a good attendance. The readers of the papers were Mr. Halsey Ricardo, the Earl of Meath, Mr. T. Stirling Lee, and Mr. W. D. Caröe.

Mr. Halsey Ricardo's Paper.

The object of my paper to-night, said Mr. Ricardo, is to try and precipitate, by means of discussion and suggestion, some conclusions as to what an ideal city should be, and also some agreement as to what a city should not contain that sets up any claims to be beautiful. What is it we want? We go up and down this city of London, for instance, open-eyed and open-mouthed, eager to observe and loud in our expressions of disapproval; but what do we want? What are our ideals? Abstract disapproval is so easy, and often so unhelpful—almost any one of us can condemn, but when bidden to specify alterations, difficulties—the difficulties in fact—at once begin to appear.

Are we agreed as to what we want? And by we I do not only mean architects, I mean amateurs of Architecture, cultivated people, men of taste, those who have given thought to the matter, made their observations on other towns and digested them, County Councillors, all those who have the care and the guardianship of this our city. What is it you want, and are you agreed upon it? What are your ideals? We architects want to know. They are your ideals that are being carried out. Architecture, so far as it is living art, is the realisation of the aims and needs of those that produce it, and the vernacular architecture of any given period is the index of the general feeling and temper of that age. The few sporadic attempts to do scholarly, antiquarian, or reactionary work have little influence on contemporary work, except where it happens to find itself in sympathy with those views; the great mass of building and construction generally is the true exponent of the popular view of architecture. Are you content? and, if so, why do you grumble? We talk of a city being beautiful, but we smile at the idea of making London so. Why? Even if, in these humble-minded days, that were too much to propose, could we

MR. HALSEY RICARDO.

not, if we wished, prevent its growing uglier? As it is, London gets more and more hideous every day. We never see an old house threatened with demolition, but what we have to fear a loss in its successor; we never see a concerted design in architecture, such as some of our squares, a few streets like Stratford Place and others, but we know their harmony is soon to be disturbed, and that quality of unity got by gracious co-operation will be burst in upon and flung into the gutter. We have buildings we call masterpieces—can we not at least preserve them unharmed? We allow the appearance of Somerset House to be defaced by mean additions. We talk of alterations to Waterloo Bridge; Hawksmoor's Church is undermined by a railway station; the moment a monument comes in the way of what is called the "convenience of the public," it is doomed and disappears.

Need for Agreement.

Is it true, is it probable, that we cannot have what we want? What is it stands in the way? It isn't money. We can afford to have our way. We hear ourselves described as an indomitable people, and we accept the epithet with complacency; it is not from want of saying that we know we are rich. We may not be an artistic people, but we are good organisers and governors, and such a standard of magnificence as Rome achieved might be ours did we desire it. The trouble is that we are not agreed as to what we want, and we are not sure that we ought to want it. Directly we are all agreed upon some public matter, an architecture springs up in response, and according to the quality of the sentiment, so is its interest. The National Conscience has for long been deeply stirred by the sight of helpless suffering, and the hospitals we have built to alleviate that, and to increase our knowledge as to its prevention, form one of the contributions of fine living architecture to the nineteenth century. So, too, are the great asylums. The care and thought, the quintessence of medical observation and research, have been gathered up and sublimed into formulated necessities, which have dominated the buildings erected in compliance, and by their insistence have given strength and history, and interest to these structures.

Public Institutions.

Other contributions to the architecture of our time are our Board schools, museums, public libraries, and technical institutes, based also on a popular desire to improve the conditions of our life. Abate something of the virtue of the impulse, and the standard of interest in style of architecture falls immediately. The theatres, restaurants, and gin palaces all rise in response to the popular call, and the nobleness of the demand dictates, in proportion, the nobility of the architecture. But in these instances there is, broadly speaking, a general agreement and codification of our desires; it is not so as regards the general treatment of our city. What is the view one is to take of London? That it is a vast workaday centre, from which all who are fortunate enough flee, after the day's work is done, to a bed in the country? If so, let us at once set about accentuating the position and importance of the railway stations, let us widen and straighten the routes between them, let us concentrate within a ring, if possible, the industrial nucleus, and separate the residential from it with an insulating zone of open space. We shall not make the city beautiful, it is true, but we might possibly its suburbs.

A Workshop?

The day has gone by when the city was walled round for shelter and defence, and the great gates of old time have been replaced now by those huge vomitories—the railway termini. But the gates of the walled city were prominent features both from within and without; their purpose was unmistakable and resulted in characteristic form. Cannot we do as much for our railway stations? Merely to clear away a wide space in front of them and to make the route spacious and direct, would do much to give them distinction.

Although I myself repudiate the idea of treating London as a mere workshop, still it is at least a definite treatment, a definite conception, and definition is what is at present so forcibly lacking in the handling of our city. The anxious, fevered scuttle from station to office, and from office back again to catch the train, is not a particularly fine idea, and is not likely to bring about particularly fine results; but, poor as they would be, they would be preferable to the present welter and the sense of compromise got from adjusting small individual claims. Or shall we take the view of London that it is a place to be proud of, and that we mean to be proud of it and keep it as a source of pride? There are many things that would justify us in this attitude—the river and some of the bridges that span it, and the Embankment that confines it; the Abbey, the Cathedral, the many churches and public buildings, some few of our squares and streets—possibly our parks.

And what should we do? Well, I am talking of the Ideal City, and I permit myself some flights of fancy that may be condemned as not altogether practical, though I try to keep on the hither side of Utopia, and so I answer, "Keep them." Keep our public buildings, keep our bridges, our squares, and our streets (those that we are agreed upon as embellishments of our city), keep them as they stand, at least for the present. As they are the subjects of our pride, let us treat them so; let the access to them be obvious and direct. Take the river for example. Let it be embanked on both sides, and let us have occasional glimpses of it from the Strand, wider and less squalid than the few grudging peeps which we can with difficulty now get. We are incessantly increasing the span of its bridges to facilitate the water traffic, let us have a traffic that may be pleasant to the eye and handy to the passenger.

Cleanliness, Processions, Music.

A swift service of small steamboats, trim and tidy, would help to relieve the congestion of our streets, and in many weathers and to many people would be a welcome alternative to the pavement. I said "trim and tidy" because on the grounds, seemingly, that we are rich and industrious we can't afford to be clean and decent, and haven't the time to be bothered with the necessary trouble; so London is disgusting and smelly owing to our slovenliness. The pride in a neat and perfect turn-out still clings to the stable, the harness-room, and the coach-house, and, by an association of ideas, somewhat affects the railway train; but the pavement is a fixed, interminable spittoon, and the tops of omnibuses a travelling one. In my ideal city, my impracticable Utopia, I would have a higher standard of cleanliness and scavenging. I would have more pageantry, more processions; and I would make many of them go by water. The Mayor and his state barges should be a familiar sight on the Thames. And I should like more music, especially on the water. The organ-grinder, the solo instrumentalist, "the German band," and all such small enterprise I would banish utterly from the streets, as well as yelling ruffians, street cries, and newspaper pitches; but in compensation I would increase the quantity of music already provided by the County Council, and I would provide a supply of kiosks in the streets where people could buy their papers in peace. We are surely all agreed that noise and disorder are ugly features in a city as well as in a house; and yet we permit great shouting letters, winking and glaring lights, every form of eye-torture that may sear itself indelibly on the brain—for the object of many of these advertisements is that you may never forget them again for the rest of your life. In the "ideal city" there would be a control over these street distractions, so as to secure some uniformity of effect. Nor should the streets preserve their haphazard character, so far as their general growth and expansion may give us chance for correction. The great streams of traffic should cross each other at right angles. The railway stations, the great creators of the swift-going traffic, should be recognised and their influence accepted, and the shortest direct routes to

them taken in hand and developed to meet the case.

Back-waters and Retreats.

But life is not all a hurrying from one ant-hill to another; there is such a thing as leisure and the enjoyment of it, there is such a thing as work which may be done deliberately and in quiet. Let us preserve, then, the backwaters and retreats, where we can find them in London, and insure that they shall not be arbitrarily invaded. They should be the shelters of our monuments. Each year we erect fresh statues in memory of famous men, but we have nowhere to put them, and they stand in the howling chaos of our streets, pitiable and helpless, horribly misplaced—or else they are thrust out of sight in narrow streets or chance corners. What a terrible misprision of their qualities this argues! It is part of the same temper that treats a piece of sculpture, an obelisk, or a fountain quite without reference to the site it has to occupy or its proper function, which is to add to, and accentuate, the general architectonic character of the locality it is to adorn. Architecture and decorative and monumental sculpture are not, as it seems to be thought, matters merely of detail, and immaterial how they may be combined, having no necessary connection—architecture in our cities should be the expression of our ideas, the ideas of a community, our corporate, not our individual desires. The aspect of our streets concerns us all, and such individuality as there may be in it is pleasant to us, so far as it reflects the history of the locality and such human characteristics as are obviously gracious and kindly.

Colour.

Lastly, there is the question of colour in our ideal city—colour, natural and artificial—both of great consequence as regards beauty and both requiring broad concerted treatment. Natural colours resolves itself into grass, trees, shrubs, and flowers.

I will leave the parks as outside the province of my paper and consider the use of grass and foliage, as it concerns our streets and open spaces. That much can be done by a mere strip of grass is shown by the breadth in front of the National Gallery. But why should we pause there? Why not compress to half their area the fountain basins in Trafalgar Square and turf the square—introducing, during the summer months, a few formal-shaped trees in tubs or boxes, to give contrast and variety to the green? Then the trees in our streets. At present they are planted at the sides of our streets, in the pavements, and the contours of the trees chosen are incompatible with the position assigned. They cannot grow properly without interfering with the light and air of the adjacent houses. Trees, such as planes, with spreading foliage, should be planted in the centre of the streets, where they can flourish unmutated and be of service in dividing the traffic. Where practicable, our streets should open to disclose a vista of green or a peep into the verdure of our squares or a glance on to the parterres of our Embankment. Of artificial colour little has been tried, and that little, done in experimental, isolated ways, is worse than useless. Colour must be treated broadly and in mass; in small quantities it is mainly irritating by its spottiness and the want of co-operation from the rest of its surroundings. Colour, quite as much as any other quality of architecture, must be used to express not merely individual whim and fancy, but must symbolise some general purpose and aspiration. Consequently, if we are to have colour in our streets, we must treat it heraldically. This has been recognised in some measure already, where colour has been employed by bodies of men—such as the State, vestries, parish councils, railway, and other companies. Here in London each parish colours its lamp-posts the parish colours, the dust and water carts carry the proper parochial bearings and legends; throughout Great Britain scarlet is the official tincture of the Post Office, black and white the traditional heraldry of the Coastguard stations. Our railway trains

and our omnibuses tell by their colour the companies to which they belong and the routes they take. We have London already divided up into various divisions—electoral, parochial, and the like. Let us take advantage of these and display those divisions outwardly to the eye. Already the parish lamp-posts, and other obstacles, are distinguished from each other by pattern and colour; we might go farther and define the boundaries of the parish by the colour of the area railings, and some form of superposed tint or quartering in part might define the electoral divisions. Moreover, the vestry hall and parish library would gather up in concentrated form the accepted heraldry of their office and locality, making them landmarks in the neighbourhood by the splendid richness of their colour, containing in their accumulation the separate badges and symbols elsewhere distributed through the locality, and explaining in the sum of their achievements the various voices whose utterances form the chorus of civic life.

Many are the "ideal cities" that might be shadowed forth—but our first concern is to settle what is to be our attitude towards the city as at present. Are we here on sufferance only, or do we mean to reside in it and consequently make it worth residing in? This point settled, the conditions of our residence will help to formulate our ideal, and by organised co-operation we can work towards this end, and once clear in our minds what we want we can push confidently towards the fulfilment.

Parks and Open Spaces.

The paper on this subject, which was read by the Right Hon. the Earl of Meath, Chairman of the Metropolitan Public Gardens Association, had been prepared by Mrs. Basil Holmes, hon. secretary of that association. The Earl said: It is difficult in the course of a quarter of an hour to speak of work which has been going on in our country for several centuries, or rightly to convey any idea of the magnitude of the need for open spaces and the various manners in which succeeding generations have endeavoured or have neglected to meet this need. The tendency to congregate into towns has always been in existence, but there has also been a corresponding desire on the part of the people to spend their holidays and the unoccupied hours of their working days in the fields and amongst the trees and hedges. The early chroniclers of English history describe all manner of sports in the field, the making of spring garlands, May-day feasts, and rejoicings in the woods, and many pleasures and pastimes on the open lands, the moors or commons, surrounding the towns and villages. The "open space movement" has been represented during the past three or four hundred years by innumerable struggles to keep free from encroachment such public lands as the Moorfields, on the north side of the City of London, and the commons, heaths, and forests throughout England, by ancient enactments limiting the increase of towns and the proximity of houses, by the opening of the royal parks, by the formation of square gardens and pleasure grounds, by the provision of forecourts or back yards to both small and large houses, and by public and private benefactions and legacies of lands to be dedicated to the people as village greens, commons, parks, or allotments. During the nineteenth century, when the development of the towns became so extraordinarily rapid, a more vigorous effort was needed to provide breathing spaces for their inhabitants; and since the year 1847 many Acts of Parliament have been passed relating wholly or partly to the preservation, acquisition, or maintenance of open spaces. Voluntary societies have come into existence to preserve or provide public recreation grounds, with the result that large parks and commons have been secured in and around our towns, churchyards, squares, and other small spaces have been laid out amongst the streets, while trees have been planted and seats have been placed in the public thoroughfares. But the ideal citizens of an ideal city would not be content with such spasmodic efforts and such varied methods of procedure. They would

provide open spaces in a systematic manner from the time of the commencement of the building of their cities. And I can only hope to throw out a few hints as to the way in which this might be accomplished.

Squares.

The plan so much in vogue about fifty or one hundred years ago of building houses in "squares" has much to commend it. But such squares should not surround gardens enclosed with railings, to which entrance is only allowed to the tenants of a certain limited number of houses. The square gardens should resemble the Continental "places"—open day and night, provided with grass, trees, fountains, flower-beds, and seats, and, like the surrounding streets, under the control and patrol of the police. The wider roads should be planted with trees, either near the houses or in a double row in the centre of the carriage-way; this would afford shelter in rain and shade in sunshine. All the public elementary schools should have good playgrounds attached, open to all comers out of school hours; and in addition to these there should be separate spaces, playing fields or open-air gymnasia provided for children, with proper instruction in the use of gymnastic apparatus; so that it might be impossible for any house in the city to be situated more than a quarter of a mile from a public playground. And these playgrounds should be attractive as well as useful, with a part set aside for trees and shrubs, flowers and seats. No large division or ward of the ideal city should be without its park, capable of being illuminated by night, where broad expanses of grass might be seen, and where stretches of water in lakes or streams might bring refreshment to the eye. The public seats should be in groups, in well-lighted parts of the thoroughfares; the drinking fountains and troughs should be artistically designed and pleasant to look upon; outdoor annexes to the restaurants should be encouraged; and every effort should be made to beautify the streets—not monotonously, but with taste and variety. What may be termed the

Modern Open Space Movement

was started before the close of the first half of the nineteenth century. The late Sir Edwin Chadwick, that great pioneer of sanitary reform, made a report in 1842 on the "Effect of Public Walks and Gardens on the Health and Morals of the Lower Classes," and he then used the phrase "open spaces." He also advocated the preservation as public land of the burial-grounds in towns when they should be disused. It was greatly due to his careful investigations and reports that most of these graveyards were closed in 1853 and the succeeding years, although another twenty-two years elapsed before any of them were laid out as public gardens. Now, in London alone, there are more than one hundred open to the public, nearly all being attractively laid out. Some of the square gardens have also been thrown open, notably those belonging to the Duke of Westminster (owing to the wisdom and generosity of the late Duke) and those on the estate of the Marquis of Northampton; and they now number, in London, twenty-seven.

I need hardly dwell on the very great success that has attended the work of the Commons Preservation Society, the Metropolitan Public Gardens Association, and the Open Spaces Branch of the Kyrle Society. These agencies have, by their labours and their example, stirred up such public authorities as H.M. Office of Works, the London County Council, the Metropolitan vestries, and the provincial county councils and municipal bodies, until it is now possible to say that the desire to acquire open spaces or recreation grounds is universal, especially in the towns and their suburbs. It is still a little difficult for village communities to understand their need of securing definite playing-fields or public gardens where they have no green or common for recreation; but the idea has taken root in the towns, and will in time extend to the villages. Full powers are now given to these public bodies, and to trustees of private estates, to give, to acquire, to lay out, or to maintain open spaces, and information on any

point connected with this subject will be gladly supplied by the secretary of the Metropolitan Public Gardens Association, 83, Lancaster Gate, W.

The Growth of the Suburbs.

There is much room for improvement in the way we build our towns and allow our suburbs to stretch out from them, ruthlessly swallowing up the rural surroundings and picturesque estates; but if the public mind is educated to the idea of preserving what is beautiful and of cultivating what is wholesome, if land-owners will only realise that the value of building land rises in proportion to the amount of timbered open space adjoining it, if people will understand that the more recreation grounds there are the quieter and less crowded each one will be, I feel sure that the architects of the future will so arrange their buildings as to preserve trees instead of destroying them, and that the cities of the future will no longer be vast accumulations of monotonous rows of houses, but will be interspersed with smiling gardens and healthy playgrounds, and surrounded by parks and woods and playing-fields.

Streets and Bridges: Considered in Connection with Our "Unideal" City.

This was the title given to his paper by Mr. W. D. Caröe, M.A., F.S.A., who said: The very limited time at our disposal for the discussion of two very large subjects tempts me to the method of a recent manifesto by a notable politician in retirement, whereby the soul of suggestive brevity seems to lie in the promulgation of abstruse queries, answerable by each man for himself. Thus—in regard to my first subject:—Shall our streets be straight or curved? Shall we adopt formal architecture, or the picturesque, or is indeed Palladian the only possible? Do we approve of Haussmannising ancient cities? Are boulevards beautiful and entirely conducive to the dignified display of architecture? Is the dignity of our streets to be measured only by their width, or the height of the buildings? How can we prevent the finest building sites passing into the hands of the architect speculator, whose productions are too often a menace to the continued sanity of those who care—and sometimes it seems also of those who are responsible—for their stability? How far shall street architecture or our public monuments be controlled, as in Paris, by a central authority, and how shall that authority be constituted? How can we instil into county councils and corporations dealing with vast architectural problems an intelligent appreciation of the accurate procedure which will ensure certainly successful results without doing indignity to our art or our honourable profession?

All these and many more springs of useful enquiry I commend to each one of you, believing that Lord Rosebery's method is perhaps more useful to us to-day than that of Socrates, and that individual taste and openings for a varying treatment under varying circumstances will help us to more fertile discussion as well as to more fertile result than any suggestions I might be able to lay before you within those limits of your time which I am permitted to occupy.

What is a Fine Street?

Intertwined with—indeed, comprehending all these queries—is the one, "How can we interest and instruct the public in architectural scholarship?" This Mr. Reginald Blomfield will deal with to-morrow, but it suggests to me to declare to you my devout belief that the finest street is not the widest street, and not necessarily even the airiest street, or the one best adapted to traffic, but first the one which has the most beautiful buildings beautifully placed; and every step taken in pursuit of our glorious ideals of light, air, safety, and convenience, which has even in attaining these turned us away from this more glorious hope and more desirable goal of beauty, is a step lost and an opportunity wasted. In which connection I will make my only reference to the archaeology of this wide subject, and bid you compare La

Rue de Fèves, at Lisieux, with our own airified and widespread Whitechapel. The chapter of

Lost Opportunities

in our streets is indeed a long one. So often might some beauty in small as well as large things have accompanied usefulness: and we may range in our quest from the Tate Gallery to the cabmen's shelter, from the cast-iron trimmings of the Tower Bridge to the cast-iron tunic of the London policeman. Most true is it that all the multifold and pressing necessities of modern city life in our streets combine to show us what we are in our appreciation of a city's dignity—the monuments, the advertisements, the open spaces, the trams, the omnibuses, the lamps and lamp-posts—aye! even the post-boxes, and the peelers, to say nothing of the telegraph and tram wires. Who shall say that we have educated our appreciations in these matters? or that they have not a large bearing upon our external city life, as we would wish to see and let others see it? To take an instance. The lamp-posts of formidable design cannot by night destroy the decorative chain which seems to thread through the maze of London streets; but what might those standards have done to enhance it by day, had they been produced from a design of graceful simplicity? There seems an opening for better things in the recent Act obtained by the City conferring the power to place lamps and wires upon house fronts. But how can any self-respecting householder (save he who holds a "public") welcome upon his house-front a lamp designed in the same spirit (to give three examples) as the new arc-light standards of the vestry of St. Martin's, the drain ventilators which tower in unsupported hideousness along the Chelsea Embankment and elsewhere, or those bloated posts whose nightly office it is to cast lurid gleams upon our most admirable Whitehall Charles I., designed as these are to dwarf and disfigure the proportions of pedestal and statue. To the official mind every statue seems in need of these overpowering torch-bearers, and with Charles I. and Lord Strathnairn thus officially glorified we may expect to behold the Duke of York and Lord Nelson each with his quota of proportionately prodigious satellites, lest perchance we may overlook some shade of our heroes' sky-seeking glory when we stand to study these things upon starless nights or in November gloom.

Further, let me instance the lack of imagination we display in the laying out of open spaces, often cleared at great cost. Are asphalt and latrines either satisfactory or picturesque when they appear as the exclusive features, perhaps eked out with a £5 penalty seat? I am not claiming much for that profession of which I am proud to be a humble member when I say that there are scores of able designers within it who could show how such things might be better done if only they were given a chance.

Posters and Advertising.

And what of the posters—those aching sores—the poor man's picture gallery (?)—so claimed by his false friends and tasteless toadies. This is a matter upon which I must refer you to Mr. Richardson Evans, the king-post of that admirable society called "Scapa" (The Society for Checking the Abuses of Public Advertising), of which I doubt not every person in this room is (or ought to be) an active member. Mr. Evans has most lucidly illuminated this question from time to time in the public press and elsewhere. But, in brief, let us clear our minds, and cease canting about the poor man's pictures and the rich manufacturer's glorious liberty of puffing (at our expense) his nostrums. Shall we not rather assure ourselves that the wanton and vulgar disfigurement of our streets can only increase the vulgarity of those who are so constituted as to appreciate such things, and let us vote at least that, if they must be, the wealthy puffer shall be taxed highly for the infliction of his puffs. In our ideal city, where all our street architecture will be beautiful, will we admit such imposition unheeded? In proportion as we take no pains to regulate the monstrous

vulgarity of our hoardings, do we confess our lack of care, of pride and of instinct for civic dignity and progress.

Holborn to the Strand.

It would be inappropriate to deal with this subject of streets without special reference to the great new thoroughfare and the opening-out of the Strand by the London County Council, the largest enterprise of its kind recently attempted and one which may be fruitful of much that we desire. Here we may perhaps turn our backs for a while upon Lord Rosebery's witty method in at least formulating hopes for the final direction these new opportunities may take.

The question of straight streets or curved arises where the plan concerns new cuttings to be made, not the following or widening of old thoroughfares, formed as they mostly are upon the curved lines of once wandering country lanes or dykes.

Now the cutting of a straight street through a district, already irregularly streeted, at once lands us in the difficulty of all kinds of awkward and canted corners. Nothing can be more unhappy than the sudden ending of a large building in a sharp, acute angle. Instances are numerous showing how this important point has been neglected through a lack of architectural instinct in the initial laying down of new streets—in many instances where it is clear that a very slight change of plan might have brought about results as much more desirable from a practical as they would certainly have been from an architectural point of view. I would make an incidental point upon this head—that however experienced in practical considerations may be the permanent official adviser to the Local Authority, yet an architect of repute and sound judgment should be associated with him in the conception of new streets. I would desire to insist that a graceful sweep, whereby awkward corners and angles are avoided, is better than the sacrifice of everything, even in the main thoroughfare, to mere straightness. I would further bring forward the simple suggestion of sweeping old side streets into the new main one in such a manner that graceful junctions are secured, which seems indeed an elementary expedient, but not one on that account the more observed or the less important.

Uniformity not Wanted.

I personally concur unhesitatingly in the desire expressed by the London County Council for a monumental treatment in dealing with the Strand Island and its approaches, and would gladly see such treatment continued as far as Holborn. But a monumental treatment need not mean the continuation of one uniform design throughout the whole length. Might not each block between the intersecting side streets be treated separately as a whole, it being essential in this case (as it is indeed in the whole matter) that the exterior, at any rate, of each such block should be under the control of one competent architect? Thus we might secure a result at once monumental, varied, and interesting, and not of a more than Parisian monotony. To some extent a similar dealing with broad frontages was adopted by the late Duke of Westminster in Mayfair, and but for the fussy influence of the terra-cotta craze, which happened to come at an unfortunate period in the development of the scheme, the work done might have been even more successful than it is. In their scheme, however finally attained, the London County Council must bear in mind rigidly to control the future alteration of façades and roofs, as well as their erection, or we may get a repetition of Regent Street, where excellent intentions, also upon the lines I have indicated, have led to disastrous results in the hands of unsympathetic or ill-trained modern maulers and re-designers.

I must not in this City of London conclude this part of my paper without brief reference to that most brilliant example of skill in the laying out of a city as proposed by Sir Christopher Wren for the rebuilding of London after the Great Fire of 1666. This is deft indeed in the avoidance of those errors to which I have referred. The introduction of

polygonal figures concentrating upon important points is so cleverly conceived that I have had the plan printed and handed round the meeting, so that those not already intimate with it may study it for themselves at leisure. It forms a more complete paper upon the subject than any I could devise to lay before you, and shows how in skilful hands ancient sites, boundaries, gateways, and streets may all be brought into order and made to contribute to an ideal whole.

Some Good Bridges.

There is no subject which excites my architectural instincts, pleasures, or regrets more than the contemplation of a bridge, be it of stone, wood, or iron. There exists what I venture to call a practical poetry about such a structure, nobly conceived, appealing to all those subtle senses set in motion by architectural appreciation. And it is not to be gainsaid that every age up to our own which has included bridge-building among its arts and sciences has unequivocally recognised this fact. I recall to you in support of this statement the numerous examples, from the Roman era onwards through Mediævalism, which loved to hallow the bridge by the chapel, down even to our own London Bridge. And while it is also true that the inspiration which has ever pervaded bridge-building has not left untouched some of our earlier engineers—among the honourable roll of whom I would name Rennie of London Bridge, Telford of Menai Bridge, Brunel of his Cornish trestles, Adams of that exquisite Eskutér Bridge at Buda-Pesth—yet it may not be denied that with the change from the direction of the architect to that of the engineer has come that lack of appreciation of beauty and fitness, resulting in those hideous bridges which disfigure our roads, our rivers, and our railways.

The Engineer as Bridge-builder.

Not for one moment do I depreciate the vast benefits to the human race conferred upon it by modern engineering skill. Had they only been as artistically successful in constructing their bridges as English engineers have been in the outward forms of their best locomotives we should have no complaint, but only admiration for all their work. But the problem was not the same. Quite absent from the locomotive, into the engineering problems of the bridge enters the element of architectural scholarship; and this the engineers have, with a few noble exceptions, made no attempt to master. When the importance of an architectural treatment has been recognised it seems generally to have been relegated to the office sweeper, who has swept up the torn pages of mutilated textbooks or manufacturers' catalogues and failed to consign them to the waste-paper basket. Albert Bridge, Battersea, Blackfriars, Charing Cross, Cannon Street, Chelsea, are specially our A.B.C. of how not to build bridges; and Vauxhall brings us nearly to the other end of an alphabet which terminates in Westminster. But it is easier to reckon the other way, when we find we have only two bridges out of seventeen within the Metropolitan area which are worthy to be named among the monuments of London.

I wish in these few remarks specially to insist upon the essentially monumental character of a great bridge; and I would urge upon our Members of Parliament, who grant bridge-building powers to railway companies, and upon our County Councillors, to excite their sluggish imagination and rise to the level of recognising at once and for all time that a bridge across the Thames is upon the same plane of monumental and architectural importance as St. Paul's itself, and demands the same developed architectural power to design or to embellish it. As regards the railway bridges, admitting fully their necessity, there is no excuse. In laying down a railway through a city the cheapest thing is to bridge the river. It does not compare with the buying up of land and claims, coupled with land construction. Yet the public has to pay in outraged sensibility and higher rates, all because of the imperturbable callousness of our Parliamentary representatives. Even now our peers have just

allowed a Bill to pass their honourable House whereby that Charing Cross monstrosity is to spread itself into Northumberland Avenue. No safeguard whatever is given to the public—not even advantage taken of the lever secured by a previous Act, which, in any widening, compelled the company to purchase the block of houses facing the Strand.

But we must admit that a railway company is not bound, in these ultra-commercial days, to hold anything sacred, save dividend; but is that an excuse for the direct representatives of our interests, who control the revenues we provide by our contributions to civic progress and order?

Vauxhall Bridge.

Why, I ask, are the County Council recognising the architectural importance of the Strand improvement and denying the architectural importance of Vauxhall, and, I suppose, Lambeth Bridge to follow? If the architecture in the Strand will cost one million, that at Vauxhall will cost at least half! Why should they assign the one to the united efforts of eight selected architects, and be content with the other as a mere piece of copybook design—in which, in the words of our premier novelist, "that rank which forms, as it were, its highest grace and ornament is mingled and confused with the viler parts of architecture?"

In no sense do I depreciate the importance of the engineer's control of all the bridge-building problems which depend upon engineering science; and if the engineer can prove himself the peer in architectural skill of those others whom I have named I am happy indeed to leave the whole work in his hands. But, as the matter now stands, and with the elaborated design before us, the action of the London County Council is wholly inexplicable and is opposed to the public interest. It is far from conducive to their being trusted as the central authority in whose hands the improvement of London and her monumental architecture may be left indiscriminately or ungrudgingly.

A New Bridge in Paris.

It would be impossible not to refer, in this connection, to the new Pont Alexandre III. at Paris, in which the architects, sculptors, and engineers have collaborated so ably together. The conditions laid down were such that a bridge of steel construction was inevitable, and MM. Résac and Alby had resort to a single span of cast-steel ribs, almost going back, constructively, to our Southwark model. To my own idea the architects and sculptors have been more successful in their share of the work than the engineers, because the latter have not been fully conscious of the limits of their material in appropriate decorative use. The total result, however, is such as to make us jealous of this bridge as the outcome of one of those things they manage better in France—merely because they recognise the simple logic of facts and the teaching of experience and history.

I hope for no more from these few remarks than that they will suffice to stimulate discussion upon subjects which cannot fail to secure your interest. Whether you are architects or otherwise, dwellers in cities or enjoying country life and pursuits, I need not remind you how in these days of strained effort, hydra-headed vulgarity thrusts itself oppressively into the daily life of all of us, and none of the arts suffers from the unwelcome intrusion so much as architecture. And our St. Michael, our hope in wrestling with the monster, must ever be an accurate and refined scholarship, which—be we mere plodders, whose best aspiration is but for a laboured success, or gifted with the imagination and resource of genius—will guide us always down a sure path, and the spread of whose wings will bring back to us beauty in our streets and bridges and all that appertains to our cities. Throughout all history the growth of civic dignity, monumentally and artistically expressed—in other words, the arts of peace—has ever been held indicative of a nation's position, power, and development in civilisation; and, if not always of rectitude in the

past, let this be our added incentive in a new century of Christian effort.

A Sculptor on an Ideal City.

Mr. T. Stirling Lee, who dealt with the subject from a sculptor's point of view, began his paper by quoting Browning's lines:—

The common problem—yours, mine, everyone's—
Is, not to fancy what were fair in Life
Provided it could be; but finding first
What may be, then find how to make it fair
Unto our means—a very different thing.
No abstract, intellectual plan of Life,
Quite irrespective of Life's plainest law.
But one a man, who is man and nothing more,
May lead: Idealise away:
You're welcome; nay, you're wise.

A fair city, he proceeded—is this building castles in the air? No; but from high thoughts and our imaginations we build foundations for its possibilities—foundations have been laid for all time to build upon, materials and all things necessary are to man's hands, then why idealise, but realise the actual.

The Natural.

It is natural for some to build, some to carve, some to paint, some to sing, to write and speak in words. We are thinking of our builders of cities. To build, then, is to some natural; it is the sport and pastime of many childhood hours. How many days he satisfies himself in building with his toys, his castles made with cards, always striving to go one better than the Tower of Babel, higher and higher. Then the outburst of joy produced by the downfall, the noise of its destruction. This natural gift in the boy we see in the man, and find in nations—joy of some to build, the greatest satisfaction of some to pull down, to make a noise.

In nations, like in man, we find the natural, the ideal, and then the material, and from these periods we have the height to which its civilisation has reached and the depths to which it has fallen, monuments for all future ages, of a nation's infancy, maturity, decay.

The Growth.

The early settler by the riverside, or near the wood, first builds his hut; he names it after its natural surroundings, "the hut by the river," or "by the wood;" he works, and by his toil produces the fruits of the earth, it becomes his garden of riches; then the thinker, who looks up, "man the uplooking animal," he sees the sun, the moon, the stars, the seasons, from his thoughts he is led to idealise, to worship, and takes the natural to symbolise his highest aspirations, object for his worship, and strikes out to more perfect manhood, to build a home wherein may dwell his God; he builds his temples, his palaces, his monuments, which clothe his thoughts and express all his highest ideals, and from these grow the maturity of a race. With this evolution of the mind of man comes also the evolution of his morals, which he calls virtues, the causes of joy and happiness, the causes of evil and misery.

We can trace the history of nations, the causes of prosperity, and the causes of decay. And it is natural for man from things seen to think and use his mind, and let the light of his soul dwell on the beautiful that it may live: the natural magnified to its ultimate to illustrate his ideas of the supernatural: the Egyptian his sun-god, light and life; the Greek with his Zeus (pure heaven) and his goddess Wisdom; the Florentine the Mother and Child, the ideal Maternity, and his love of labour—for was not his symbol of harmony of life the sound of the smith beating into instruments of music the crude metal of the earth? Take these five subjects: light, life, wisdom, maternity, labour, and round them you can build all the highest thoughts of man and the religions of nations, and which have been the subjects and themes for the monuments of all the great cities of the world. Take each subject to its ultimate, and you have the perfect actual—subjects fitted for sculptor's art and worthy to be placed in your ideal city.

But with power comes decay—the worship of the man, much self-glorification. The material man, not man's mind or soul, do we

measure him by; but his material external is portrayed, which produces destruction to the great ideal. We then produce the bulb, no longer the flower that has made this city fair.

The Sculptor.

So we workers in clay, wood, stone, and metals are but the children of your city. We are, at the hand of the builder, to write in streets the great thoughts of your philosophers, the dreams of your poets, the great victories of your warriors, the ever-spreading influence of civilisation, its truth, its justice, and its liberties, that in figure these ideals may live in the crowded streets of your city. But to hand down the mere posthumous portrait of the man is to give to the world the shell without the kernel—not the ideal in which the sculptor's soul may live and breathe, but the dead, mechanical production of a dead thing.

Has the sculptor any ideal for our technical side? Does he reach out to any ultimate in his means of expression? We see he has his ideal subject; has he ideal rules for his practical work? He knows that life is governed by simple natural laws; so just as simply must this child of nature express himself, and must govern every detail of his perfect work. It depends on the man, his mental vision. You may show him examples of the highest realisation of men's mind and hands, but he cannot reach them if his power of thought is not strong enough to produce the same conception. Take the pupil and the worker beside you: you can so transmit your thoughts and the way in which you see things that he can see just what you point out; but immediately he is left alone he falls back to his own range of vision.

Laws of Sculpture.

What are, then, these simple laws that govern the ultimate of the sculptor's expression? They are the combination in a work of three characteristics of the arts—architecture, sculpture, and painting. The dignity and monumental of the architect, the simplicity of severity of line and form of the sculptor, the atmosphere of light and shade of the painter—all these we find in the great works realised by man in his maturity, and prove what is always said by great artists, "that there is but one art, but different means of expression."

For subjects you take great abstract truths, for treatment you take the natural object and clothe it with its attributes to personify the unity of atoms into a great whole; and by the eyes we see and the power we feel will be the result and nearness attained to our great ideal. "The situation," says Carlyle, "that has not its duty, its ideal, was never yet occupied by man. Yes, here in this miserable, despicable actual wherein thou even now standest, here or nowhere is thy ideal: Work it out therefrom. The ideal is in thyself; the impediment too is in thyself."

The Discussion.

The reading of these papers was followed by a brief discussion, which was opened by Mr. H. E. Milner, who pointed out how the realisation of any of the ideals they had been considering must be governed by business considerations. Few cities had been built for residential purposes, with trade merely as a supplementary consideration. He gave some details of the best arrangements of streets, positions of factories, railways, &c., but pointed out that the character of the individual buildings must be decided by those for whom they were built. Mr. Owen Fleming pointed out how the opinions expressed by the R.I.B.A. had influenced the character of the improvements at Whitehall and of the new street from Holborn to the Strand. With regard to Vauxhall Bridge, he remarked that the London County Council had to choose between accepting the advice of the Institute of Architects and the Institute of Civil Engineers, the opinions of the two bodies being widely divergent. Mr. Cates spoke of the way in which suburban estates were laid out, without regard to considerations of beauty or convenience, but solely with the aim of creating

ground rents. He thought the land owners should be compelled, when laying out new estates, to provide open spaces for the new populations which would live on the estates. Mr. Charles Hadfield, of Sheffield, said the process of swallowing up the suburbs was going on everywhere; he should welcome the granting of largely extended powers to municipalities for dealing with land owners and speculators. After a few remarks by Mr. Edward S. Prior, a hearty vote of thanks to the authors of the papers was carried unanimously and briefly acknowledged.

THE EDUCATION OF THE PUBLIC IN ARCHITECTURE.

This was the title of the paper read on Thursday last at the fifth meeting of the Architectural Congress by Mr. Reginald Blomfield, who said:

The subject on which I have been invited to address you to-night is one of such intricate difficulty, and so closely connected with wider questions, that any reflections I may offer you are only in the nature of prolegomena. That such a subject should be suggested for discussion at this Congress is significant, for it points to the fact, with which we architects are painfully familiar, that the public does want educating in architecture very badly; and, in saying this, no imputation is made against our individual clients. The mere fact that they come to us shows (at last we think so) very excellent good taste, and though this impression is not always maintained, and occasions have been known to arise in which the architect has had to admit his inability to cope with the client's tenacity as to plate glass and other matters which vex the souls of the righteous, yet, on the whole, and properly handled, the client will usually follow his architect's lead. I shall, therefore, not attempt to deal with that most tempting subject, the intellectual relation of architect and client. What we are here concerned with is the general standard of intelligence in regard to architecture, the appreciation and misappreciation of the art as shown by current judgments, whether in the press or elsewhere; the evidence of taste displayed in actual buildings which reflect the average opinion of the times. The

Attitude of the Man in the Street

is the problem with which we have to deal. Now I fear there can be very little doubt that this attitude is far from satisfactory. I think that any competent observer who took note of the average of architecture in our great cities would be driven to the conclusion that the general level of taste and ability was low; further, he would find that some of the least admirable of these buildings were the most admired; and, lastly, if he compared his observations not only with the criticisms of the Press but with individual opinion, he would find no common standard of appreciation—merely a mass of unrelated judgments, amounting to little more than individual expressions of like or dislike. He would, in short, find public opinion on architecture in a state very little removed from chaos. He would find that there is no intelligent body of opinion to which a competent architect can appeal as a matter of course, and that the public in the pursuit of architecture are like sheep without a shepherd. The uncertainty of taste shown in the treatment of public buildings of the last fifty years—shown I do not mean by the architects, but by the authorities responsible—is conclusive evidence of the confusion of judgment which exists in the minds of our representative public men. First we had the Houses of Parliament, then the Foreign Office, then again the medievalism of the Law Courts, and now (I think fortunately) the Classic of the new Government buildings. It is evident that the authorities have had no sort of principle to guide them, and so the pendulum swings backwards and forwards. Unhappy officials, burdened with a responsibility of taste beyond their capacity, catch wildly at any passing fashion. Their chief idea seems to be to make a desperate bolt for cover; as for any consecu-

tive tradition of taste, any steady development of ideas on architecture, the case seems as hopeless as ever.

Genius in the Place of Tradition.

It has been suggested that this state of affairs is inevitable, that it is the penalty we pay for the individualism of English genius; that though the French do in fact possess a traditional standard of taste and technique, they do not reach the excellence attained by Englishmen in isolated instances. There may be some truth in this view; we cannot have a school and at the same time genius breaking out in all sorts of different directions at once. That we have no school in this sense is quite certain, for the Academy exists for other purposes, but it is to be doubted whether we nowadays produce genius in sufficient quantity to compensate for this absence of tradition; and at any rate this deficiency has not always been characteristic of English architecture. If, in the last century, Mr. Vardy or Mr. Ware, Mr. Wood of Bath, or Mr. Flitcroft were called upon to design a building, they knew exactly what they had to do; they had no necessity to clear the ground by a long preliminary discussion as to the style to be adopted. Given the client's general instructions, everything followed as a matter of course. The workman had all his details at his fingers' ends, and the client would have been much surprised if he did not get a house up to the accepted standard of taste, and as like as two peas to the nine hundred and ninety-nine "seats of the nobility and gentry" then being erected in every part of England. Everything went as smoothly as clockwork. Such a state of affairs has, of course, its defects. It may lead to dullness, pedantry, and stupidity, yet architecture is so difficult an art that it is only by long continued effort on familiar lines that any excellence may be attained; and without this state of things we should never have reached that complete accomplishment within prescribed limits, that clean precision of workmanship, which is so essentially characteristic of early eighteenth century work in England.

Literary Architects.

But about a hundred and fifty years ago a new element appeared. The amateur and the virtuoso assumed an importance they had never previously enjoyed. Distinguished noblemen dabbled in design. Eminent men of letters amused themselves with architecture. In 1750 Horace Walpole writes, "I am going to build a little Gothic castle at Strawberry Hill," ominous announcement of the impending change; and in the next few years Walpole completed his ridiculous house, to the admiration of all his acquaintance. The worst of it was that, though perfectly absurd in his notions of architecture, Walpole was a man of brilliant literary ability and a reasonably good connoisseur. Moreover he thoroughly understood the temper of his class, and the consequence was that his ideas "caught on" and were accepted by a good many foolish people as a necessary part of polite taste. Moreover—and this was where the mischief came in—they took their place in that romantic movement in literature which was soon to overrun the whole of civilised Europe. It is rather curious to reflect that the eighteenth century, supposed to be *par excellence* the century of logic and lucidity of thought, should have seen the birth of that confusion of ideas as to the limits and relations of the different arts from which we suffer at the present moment. Joseph Spence, an intimate friend of Walpole, wrote an elaborate treatise to interpret plastic art in terms of poetry, and, though this book was pulverised by Lessing, his fallacy, or rather the temper of mind which admits of it, is extant to this day. Walpole subordinated architecture to the elegant insincerity of his own literature; and the loss of all tradition in taste and standards of judgment was now only a question of time. Literary men had got the control, and it was not for mere architects to dislodge them. Moreover, these very architects were too often their humble and obedient servants. Though Chambers, last of the Romans, made a defer-

mined stand for the old ways, Robert Adam devoted his extraordinary cleverness to the introduction of a new manner in design; the Dilettante Society had set the ball rolling, according to the latest lights of Stuart and Revett; and now there was this direct attempt being made to reproduce Gothic architecture in addition to purely literary sentiment. It was hardly to be wondered at that the layman should lose his bearings. In the heat and turmoil of all this revivalism he might be pardoned for thinking that taste in architecture was a mere matter of pitch and toss. Thus this century opened with

Three Styles Struggling for Ascendancy.

The old traditional Classic of Chambers and his school; the new Greek method, which was to be carried to such a high degree of excellence by Decimus Burton, and later by Thompson, of Glasgow; and, lastly, this revived Gothic. All architects of reputation followed one or other of the first two manners. The amateurs stuck to the Gothic, and the amateurs carried the day; but when one considers that the whole force of the Romantic movement was behind them, the result is not surprising. So Wyatt, or Wyattville, or whatever he chose to call himself, started his career of architectural murder. Then Pugin followed, and threw himself into the cause with the enthusiasm of a very ill-regulated mind; and then came Ruskin, a man of narrow prejudice, but brilliant genius, whose eloquence won a sort of St. Martin's summer for the Gothic movement, prolonging its life quite two generations beyond its appointed time. I need not follow further the familiar history of the Gothic movement, but there is one important conclusion which I should venture to draw from this hasty survey, and it is this: All these men, from Horace Walpole to Ruskin, seem to me to have laboured under one very serious vice in their handling of architecture. If I may say so, they all took their eye off the ball. Walpole treated architecture as a subordinate expression of literature. Pugin, and still more Ruskin, translated it into terms of ethics.

The Result

has been that the idea of architecture as an art, with its own limits, its own technique, and its own ideals, has been forgotten, and one has almost to say lost. Volumes of eloquence as to the moral beauty of certain forms of architecture not only teach one nothing, but are actually misleading as to their artistic value. For an architect may be a very good man, and design and build with the utmost sincerity and moral enthusiasm, but his work may be exceedingly bad; witness that childish building the museum at Oxford. And, on the other hand, it is very well-known that artists of distinguished ability, whose work has had a singular fascination for intelligent judges, have been, to say the least of it, not immaculate. The critics have, in fact, set up an irrelevant standard; they have concentrated attention on matters which interest them, but which have no more to do with architecture than with boot-blackening; and we stumble here on some of the radical defects of serious English criticism. That strenuousness on which we pride ourselves has the result either of making our critics take their subject as a text for their own rhapsodies, or else it drives them out into action in the form of a directly moral application. They seem incapable of that cool and equable sympathy with every man on his own merits, that patient waiting on the development of genius which gives its extraordinary value to such criticism as that of Sainte-Beuve; for the function of a critic is to explain and interpret, not to substitute his own personality for that of his subject.

First Principles of Reform.

We have thus arrived at two results—first, that public opinion on architecture is practically non-existent, that is, the judgment of the public tends to be irrelevant and to rest on side issues; secondly, that this has resulted from the subordination of the art to the amateur; and the question now arises how this state of things is to be dealt with.

In the first place it seems to me that a fresh

philosophy of art is necessary, or rather a return to that clear understanding of the limits of the various arts on the lines laid down by Lessing one hundred and thirty years ago. We have to recover and drive home the truth, that if the arts have some common ground, yet they differ essentially "*ὅλη καὶ τέρσις μίσησιν*" in their subject matter and technique, and what Lessing did for poetry, painting, and sculpture we have now to apply to architecture. We architects have to build up in the public mind the conception of architecture as an art, with its own methods of expression and its own problems. We have to make it clear that architecture is not sculpture and painting, but architecture; that, given the practical conditions to be complied with, the architect has to treat them *secundum artem*—that is, that his concern is with proportions, mass, and light and shade. It is easy to sneer at the old jargon, such as the relation of solids to voids, and the like, yet these remain a general description of the actual difficulties in design that our art has to attack; and our skill should show itself not in the skilful reproduction of other people's buildings, or somebody else's motives, but in this exact adjustment of proportions, in the subtle management of light and shade, of shadows and reflected lights. It is due to the causes which I have endeavoured to indicate above that this conception has been thrust on one side, even by architects themselves.

Art as a Whole.

There is, and has been for the last few years, a very favourite watchword among us, "Art is one," and under cover of this motto the crafts have manoeuvred a skilful and insidious attack on architecture. The architect has been relegated to the position of the useful drudge who blows the organ while the craftsmen play on it. His function has been supposed to be that of providing an occasion for the arts of the sculptor, the painter, the metal-worker, the enameller, and all the others of the noble army of craftsmen. If the architect's architecture gets in the way it must get out of it, even to the destruction of the finest architecture in the kingdom; and in this way the architect is considered to establish his claim to be a member, though, indeed, but a poor relation, of the family of artists. As to this Shibboleth, of course all art is one, also it is not. It is one in the sense that, to the exercise of any art, some measure of imagination and practical invention is necessary, and again in the sense that any work of art is an expression of the human intelligence. In this sense the saying is true, but it is also a harmless platitude. If we try to get at the facts we find that all art is not one, that, on the contrary, each art has its separate province, divided from its neighbour by neutral ground which either may occasionally invade, or which they may fairly occupy in common; yet their separate limits ought to be strictly maintained in thought, and both in this and in many other instances the crying need is for clear ideas. It is to this groundwork of thought that I think we ought to direct our attention if we hope to educate the public. It is very desirable that the layman should know the history of the architecture of his own and other countries; his ideas will gather shape and colour from actual instances; and it is almost necessary that he should have some acquaintance with acknowledged masterpieces, in order to acquire some practical standard of judgment. Yet it is the use of this standard that constitutes the real difficulty. It is of very little use having a standard, and even a great mass of knowledge, if you have no idea how to apply it; in other words, it is of very little use to supply the public with facts and pattern books until the public mind is prepared to receive them, and it is here that the real difficulty of education begins.

Channels for Reaching the Public.

There seems to me, generally speaking, to be three channels through which public opinion can be reached: (1) by direct school teaching; (2) by treatises; (3) by the work

of architects themselves. In regard to school teaching, a good deal more might, I think, be done in this direction than anyone seems to contemplate at present. In most of our important public schools there is an art museum of sorts, a drawing class, run on rather old-fashioned lines, and usually some intelligent master with a cultivated interest in the antique and a sentimental attachment to early Italian art. Now, I am not in the least depreciating the work so done. It is good, as far as it goes, and is a very great advance on the neglect of any such teaching habitual thirty years ago. What is wanted is a more complete organisation of this teaching and a more comprehensive scope. Boys, those at any rate with reasonable powers of observation, are quick to pick up impressions, and there can be no doubt that they acquire some valuable elements of culture from the casual information that they are able to gather in this manner; yet I think I am correct in saying [that the boys' attention is called to art not from an artistic but from a literary standpoint. Our public schoolmasters are, as a rule, very excellent educationalists; there are probably none better in matters of scholarship and literature; but they regard the arts from the point of view of the average British public, rather as an elegant and superfluous accomplishment than as a serious expression of thought. Architecture in especial—I may say it in this company—from every point of view the most important of the arts, is hardly ever dealt with in our public schools. A boy gets some slight acquaintance with Greek and Italian sculpture from the casts in his museum, and learns the names at least of the great painters; he may also hear something about churches and buildings from the school antiquarian society, but of architecture never a word. I recollect the amazement of my uncle when I went into his office at three-and-twenty and did not know the meaning of a mitred joint; yet such ignorance was not only the natural but the inevitable result of the school and university education of the time.

What Boys might be Taught.

What I think might be possible would be, (1) to provide a well-selected set of architectural drawings of well-known buildings, and the simplest possible technical diagrams, such as should be easily intelligible to the schoolboy mind; (2) to give an occasional reading in architecture, dealing with its simplest points, and illustrated by models and clear drawings. The object of any such lecture should, of course, be merely introductory—that is to say, it should not attempt any elaborate disquisition on styles, or even on history, and should carefully avoid any attempt at technical instruction. What is wanted is such a handling of the subject as will call the boy's attention to architecture and give him an interest which he can develop later if he has any aptitude that way. By this means the ground would be broken up for the more detailed courses of instruction, such as are provided by the Architectural Association, Liverpool and London Universities, King's College, and the like, and even if the study were carried no further it would leave an intelligent interest in the art, and have an educational value of its own. Some sort of architectural text-book for beginners is, in fact, badly wanted; but the necessity of extreme clearness and simplicity of treatment, in addition to a comprehensive grasp of the subject, makes the preparation of such a text-book a matter of very great difficulty; yet it ought to be possible to prepare such a work, and I commend the problem to our professors of architecture. Something has already been attempted in this way in the University Extension Lectures. I have no experience to offer on this subject, but it appears to me that the lecturer labours under two serious disadvantages. In the first place he has to address a mixed audience, mostly of an age at which learning is not so easy as it used to be; and secondly, he has to make his lecture popular and attractive, otherwise his class falls to pieces. Moreover, so far as I understand, every lecturer is free to follow his

own devices, with the result that what one man builds up another pulls down. At every point, in fact, in our attempts at education in architecture we are brought up short by this want of a common standard, this loss of all established tradition.

The same difficulty meets us in the attempt to influence opinion by books and treatises. It was easy enough to lay down the law about architecture when the five orders and their strict observance constituted the law and the prophets.

Architects at Fault.

In Wren's time there was no necessity to educate the public. Evelyn did all that was wanted when he translated Fréart's Parallels. But nowadays we have no law; and if we architects are not agreed among ourselves as to the principles on which we should appreciate one another's work it is inevitable that the public should be hopelessly at sea. Yet I believe that our differences of opinion are more superficial than serious, more the result of misunderstanding than any insuperable cleavage. Whatever our individual divergences of manner, a really fine piece of architecture is usually accepted as such by most of us, and the problem before us is to disentangle the common ground of judgment on which we undoubtedly act, and to define it in such a form as will be intelligible to the public and be a guide to them in their own appreciations, a task again of the very greatest difficulty, and, perhaps, not the work of one generation, or of one man; yet I do not think that such a result will be indefinitely postponed. The consensus of competent judgment gains ground every year, and in time a method of criticism may be deduced from it, something far wider and more penetrating than the time-honoured system of the orders.

Meanwhile, and at a lower level, something might be done. It has been suggested that a series of plain pattern books for builders, giving working drawings of quite simple designs for doorways, windows, and the like, would save us from the utter vulgarity of the great majority of modern buildings in this country. It is well known that on the greater number of such buildings no architect has been employed, but the public is not aware of this, and its vision (such as it is) is being constantly perverted by the worst possible models in front of it. This, at least, we might escape, and the builders of the last century did escape it, because they worked to an excellent set of accepted patterns. It would be a most useful and, I think, practicable task if a committee of architects of recognised competence could be formed to superintend the issue of some such series of pattern books. In the matter of building construction this has already been very well done, in the South Kensington volumes, and it would not, I think, be difficult to supplement this on the side of design.

The Most Important Means.

Lastly, we come to what is, after all, the most important means of educating the public in architecture—our own work. Not only does an architect have a unique opportunity of educating the individual in his relations with his client, but each fresh work should be the most convincing embodiment of his own ideas of architecture, of which the effect, like that of a stone cast into the water, must spread in ever-widening circles far outside the centre of its first attack. We must set our own house in order before we can sweep and garnish that of the public; and thus the education of the public passes into the more intimate question of the education of ourselves; and at this point I may fairly leave it.

Perhaps at this moment the two worst faults of our architecture are, first, the total absence of any sense of style, that kind of design which snatches up any sort of detail and tacks it on to any kind of building, and of which there is abundant illustration in most of our new streets. This method we are all agreed on condemning, but there is another and rarer fault, and the more dangerous because it is the vice of a virtue, and this is a certain preciosity, what Pliny calls *Quædam artis libido*, which runs out into frantic experiments after something new and altogether original.

This latter habit of mind turns its back on tradition, or thinks it does, and resolutely eschews beauty, in its wild attempt at strength. Both of these faults can only be attacked by a more thorough and intelligent education of the student, and by a clearer appreciation in our own minds of the province and ideal of architecture.

In the first sentence of this paper I mentioned the extreme difficulty of this subject, and I have endeavoured to show that the state of public taste at present is due to deeply-seated causes, causes so difficult to reach that one might almost be tempted to despair of the future of architecture. Our best ground of hope is in the excellent work being done by individual architects, and in the agreement, rather than disagreement, of critical judgment which exists among ourselves. Such an agreement must, in the long run, influence public opinion. What we experts say in this generation will be matter of common knowledge and acceptance in the next. It should be our work, therefore, to clear the air of misconceptions, and to endeavour to build up again an aesthetic judgment, which shall be independent of styles and fashions, because it rests on the essential facts and conditions which lie at the root of all good work in architecture. We cannot ourselves expect much immediate result, yet perhaps our children's children may enter into possession of the promised land.

The Discussion.

Professor F. M. Simpson (Liverpool) said his opinion on this subject could be expressed in one sentence—the education of the public in architecture depended entirely on the education of the architect. It was the current work, the work with which we were surrounded on every hand, that affected the public and not the knowledge or representation of buildings erected in past ages. It was a well-known truism that in order to educate people you must first interest them, and though it was possible to interest them in the manner suggested by Mr. Blomfield, it would be only a passing interest, whilst if the education was carried past a certain stage it would cause a false standard to be raised, because it would be an archaeological one. The architect should always lead and the public follow; not *vice versa*, for there must not be retrospection but advancement. If building continued to improve in the way it had done during the last twenty-five years the education of the public would follow as a matter of course, because they would be surrounded by good examples instead of bad ones.

Mr. Basil Champneys, M.A., took rather a gloomy view, and held a pessimistic opinion about the future. If the public would not take any interest in architecture, what could be done? The architectural room at the Royal Academy, for instance, was looked upon as a spot where were gathered together a number of drawings which might be seen with much more ease in the auctioneer's window. The speculator was gaining ground, and every year buildings without any merit were being erected in increasing numbers. He had grave doubts about the solution being found in the architects improving their work, for was this possible when the public did not ask for it? Nor did he favour the pattern book suggestion, because the builder would be sure to mix up all the designs, and use one sort of a door and another kind of window.

Mr. E. S. Prior, M.A., agreed with Mr. Blomfield's plan of campaign, and in the course of a most humorous, though somewhat erudite, speech he drew a picture of the time (about 2,000 years hence) when architecture would have ceased to exist, because then everyone would be always speeding from point to point by some rapid means or other, and, of course, stationary buildings would not be needed; pendants would then refer to architecture as a system adopted in barbaric days of piling stones on top of one another for no known purpose; this would be in the age of locomoture, when the lands were peopled with "locomots." However, reverting to the prosaic, he pointed out that architects to-day were like knights who taught the rules of

tourney without being able to sit a horse, and he concluded by saying that the public could only be educated by the architect becoming first educated himself.

Mr. Paul Waterhouse, M.A., asked the pertinent question: Had the public ever been interested in architecture? He thought not, and we need therefore not be despondent by the present aspect of things. We should leave the public alone and look to ourselves.

Mr. John Slater, F.R.I.B.A., B.A., thought it impossible to teach the public to take interest in architecture, but he would urge that architecture should be taught in our schools, and he felt sure that the small amount of knowledge acquired by those who attended University Extension lectures would enable them to appreciate more the great old buildings, and give them an interest in architecture generally which they would ever retain.

Mr. Beresford Pite gave it as his opinion that "a little knowledge was a dangerous thing." There were very few living arts, and until we could arouse our enthusiasm we should be helpless to teach the public. We needed intelligent criticism of architecture, and, more than all, we needed to educate the jerry-builder by showing him that it was just as economical to put better bricks in the house than to use those of inferior quality, and sprinkle the whole with stupid ornament.

Mr. E. W. Hudson, A.R.I.B.A., and Mr. H. G. Ibberson, A.R.I.B.A., also spoke, and Mr. Blomfield replied.

RESPONSIBILITY OF LOCAL AUTHORITIES IN RESPECT OF BUILDING BY-LAWS.

This was the subject of the paper read by Mr. Lacy W. Ridge at the sixth meeting of the Architectural Congress, held on Friday last. Mr. Ridge said:

It may be present to the minds of those who are members of the Royal Institute of British Architects that on June 12th, 1899, that body passed unanimously a report drawn up by a special committee on building by-laws in the non-Metropolitan districts of England and Wales. Among the suggestions of the report was one that the Local Government Board should be requested to receive a deputation on the subject of these by-laws. On October 26th last a deputation, which had to be hastily got together, and was consequently not as fully representative as might have been desired, waited at Whitehall on Mr. T. W. Russell, M.P., the Parliamentary secretary of the Local Government Board. Several of the permanent officials of the Board were present. The immediate result I may describe to you in the report sent to the Council of the Institute, and published in the Journal on November 11th, 1899.

The deputation, referring to the report addressed to the Local Government Board by the Institute, laid before Mr. Russell the views of the Institute on the advisability of grouping the Model By-laws for non-Metropolitan districts in England and Wales, with the view to the adoption of such groups, and such only, as were applicable in particular localities; and the exemption from certain groups of by-laws of detached buildings standing within their own grounds; the uncertain requirements of local authorities as to the drawings required to be deposited, and their declining in some cases to give the grounds of their objections where approval of plans is refused; the establishment of a special technical Tribunal of Appeal; the extension to the provinces of the London system of dealing with rights as to party-walls; and other questions connected with the administration of building by-laws.

Mr. Russell, in reply, said that, as regards the principle underlying the report, *i.e.*, the advising by the Local Government Board of the local authorities as to what by-laws it would be best for them to adopt, it was always a delicate matter, owing to the jealousy of local authorities at the interference of a central authority. He thought the question of grouping the by-laws was a fair point for consideration. As regards the demand on the part of

local authorities for drawings, such bodies often exceeded their rights; but in some instances powers were given to local authorities by special Acts. At the stage reached by the present Parliament he could hold out no hope of legislation on the questions involved, but everything had been carefully noted, and should be submitted to the consideration of the expert advisers of the Board, who would report as to the extent it would be possible without legislation to meet the views of the Royal Institute. In conclusion, Mr. Russell asked whether it would be possible to confer with the deputation again. An answer having been given in the affirmative, the deputation thanked Mr. Russell for his courteous hearing, and withdrew.

If the exigencies of an aged Parliament rendered legislation impossible in October the crisis through which the country has since passed has filled not merely Parliamentary officials, but the general public, with anxieties and considerations of such tremendous moment that the lesser evils which local legislation or administration can cause or cure have sunk into insignificance. It would, in the months that are past, have been useless to attempt, either through the newspaper press, with their well-filled columns of startling and too often sad news, or through any other channel, to arouse public opinion on such a subject as building by-laws.

What might be expected from Legislation.

So far as legislation is concerned we must be content to wait in readiness to impress on a new Parliament the propriety of considering Bills for the extension of the Metropolitan system respecting party-walls to the whole country; for some proper and equitable system of dealing with "ancient lights," and for such modifications as may be desirable in the Acts affecting buildings in non-Metropolitan districts. Primarily, however, the report of the Special Committee was intended to deal with the by-laws under existing Acts of Parliament as a matter of administration only. Whether anything has resulted from the consideration of the expert advisers of the Board promised by Mr. Russell I am not in a position to say. It is not inconceivable that at such a time the blessings of peace may have special charms for those who are so comfortably described as "permanent officials," and that things are going on much as before; and that vast tracts of open, sparsely inhabited country are still being annexed to an ambitious little town somewhere in the neighbourhood, and the liberty of the inhabitants subjected to "urban powers."

Unfavourably, however, as the circumstances are for vigorous action, I felt that I should be almost "looking back," "after putting my hand to the plough," if I allowed a Conference of Architects to be gathered from all parts of the country here in London without at least offering to bring forward again this subject of building by-laws on which we have still so much work before us. The particular part of the Report of the Select Committee to which I wish to call attention is its last paragraph. "The influence of those who are interested in building would have to be brought to bear upon the local authorities to urge them to give effect to the proposed measures of relief by adopting such, and such only, of the divisions of the by-laws as would be applicable to their district or to different portions thereof."

Gathered in this Conference must be many who have great personal influence with the members and officials connected with local authorities, while nearly all must from time to time have dealings with them. Architects collectively and working together (why do not architects work better together?) should have an almost decisive voice in these matters. Any other profession would be recognised as the authority on any subject bearing so directly on its work as these by-laws do on our work, and would be allowed to suggest for enactment pretty much what it thought fit. Under the Public Health Act it is the local authority that makes the by-laws, and it has power to alter or repeal them by a subsequent by-law. It is merely provided that they shall not take

effect till confirmed by the Local Government Board. Now it is necessary that the

True Position of the Local Authorities

should be understood in this matter. Possibly the more important corporations may know their own power, but the constant excuse for harmful by-laws given by members of the smaller bodies I find to be that the by-laws are thrust on them by the Local Government Board. Mr. Russell, on the other hand, speaks of the jealousy of the local authorities at the interference of a central authority. The explanation of the difference is, I think, that the smaller authorities and their advisers are quite without the knowledge and experience which would make them capable of struggling against the centralised Board at Whitehall, and so take whole what is sent to them. Herein architects as a body might very effectively help these authorities, and I propose to call attention to

Three Special Points

taken out of the Institute report as being of particular importance. The first point on which architects ought to insist is that there should be definite and explicit regulations as to the deposit of drawings. This appears in the body of the Special Committee's Report, page 450 of 1899 R.I.B.A. Journal. The principle is that a block plan, with drainage, public roadways, and adjoining premises, should be deposited and left with the local authorities, and that other drawings should be submitted for inspection, stamped, and returned.

The report says: It is of great importance that the requirements of the local authorities as to the deposit of drawings should be reasonable, and that they should be explicitly stated. The Committee suggest that in all cases a block plan, with the lines and depths of drainage shown thereon, together with the nearest public roadway and adjoining premises within 100ft. of the proposed building, should be deposited, and that, where required, plans and sections (together with elevations, if needful to explain methods of construction) should be submitted for inspection during a defined and limited time; which drawings should be then returned, stamped, if approved, or, if not approved, accompanied by a precise statement of the particulars in which the by-laws have not been complied with.

Whitehall Traditions.

It seems to be a sort of tradition at Whitehall that the by-laws cannot go beyond saying that the plans and sections are to be deposited—a wonderful emanation, I suppose, from the legal mind. Mr. Russell, however, said he could see no objection to the by-laws making regulations as to the mode of deposit, and no wonder, for what the Act says is, "And they may further provide for the observance of such by-laws by enacting therein such provisions as they think necessary—as to the giving of notices, as to the deposit of plans and sections by persons intending to lay out streets or to construct buildings." Note the absence of elevations. "Provisions as to the deposit of plans," &c., is surely wide enough for a reasonable and definite arrangement. It is extremely objectionable that unnecessary drawings should choke up the offices of the local boards, and that architects should be called on to leave there in perpetuity plans of their works, to be studied at their leisure by the local surveyor—possibly a rival practitioner—and by his clerks. If for the public good persons about to build must make and deposit plans, they should at least be informed definitely what they have to do, and be put to as little trouble and, above all, subjected to as little delay as possible.

Next I would urge on you to get the local authorities to push the adoption of the Institute's by-law on party-walls (Division D, p. 451). It is long to read through, and might not be wholly intelligible at once. It gives relief, however, in the case of small houses in two particulars which will be much valued by investing builders; it settles the point up to which the party-wall need not be carried through the roof, so that in exposed situations (as along the south coast), where the difficulty of keeping out the weather is considerable, and the risk

of fire very slight, the roof over a row of small houses need not be broken. It would also allow a single-brick party-wall to be used in cases where the by-laws now require, and require wisely, the use of one and a half brick external walls. The main charm, however, of treating party-walls in a division by themselves would be that it would enable the local authorities in many cases to say: "You have laid out your streets with ample space, in accord with Division B; you will comply with the sanitary requirements of Division F; separate your houses properly with party-walls, as Division D, and we will trouble you no further; for it is impossible to see how you can be any nuisance or danger to your neighbours, and we will trouble you no more with by-laws." Taking such a position with small properties, or with pairs of workmen's cottages or villas, particularly in the country, would be a great relief to everyone, and do much, very much, to obviate the ill feeling which now constantly arises from insisting on useless trifles merely for the sake of enforcing the by-laws, as if that in itself were a good and wholesome thing; an opinion only too likely to grow into a fossil in the official mind.

A Few Practical Points.

Again, I would insist on the alterations named under Division E on page 452, whereby in a storey in a roof, and in the storey immediately below the roof (not being a ground storey), timber construction and weather tiling or plastering is allowed in place of brick in detached or semi-detached domestic buildings, and also that some credit respecting the thickness of the wall should be given for the tiles in weather tiling nailed to brickwork. Admirable, warm, sound, and picturesque construction, very characteristic of some parts of the country, is being thrust out of use, not because it is defective or has been found wanting, but from pure ignorance, and because the by-laws were founded on the London Building Act. This was primarily a piece of panic legislation after the Great Fire, and directed, and rightly directed, against fire in a town crowded in a way we can hardly now realise. Many of its provisions are inapplicable where wind or rain, which are certain, are far more formidable than the very rare fire which soon burns itself out. The London Act landed us with Gower Street and Harley Street as the normal types of building. It is not for architects to acquiesce in the same sort of thing happening all over in the country through the abolition of local characteristic styles of building.

Finally, let us ask the local authorities to remember that it is local government they have to administer; that they exist, not for the enforcement of a set of by-laws, whether they be useless or not, but for the good of the community; and that their office will be best promoted in the matter of building when they carry with them the intelligent goodwill of those who build; which they certainly will not attain by curtailing unnecessarily the liberty of the subject.

The Discussion.

Mr. W. J. Locke, the secretary of the Institute, read a letter from Mr. William Henman, F.R.I.B.A. (Birmingham), in which he instanced the case of the Birmingham City Council, who, a few years ago petitioned the Local Government Board to modify the by-laws in connection with certain tenements they were building, though before that they had been zealously insisting that everything should be carried out to the letter.

The chairman (Mr. W. Milner Fawcett, F.R.I.B.A., M.A.) also emphasised the point that they were tied down to the exact letter and not to the spirit of the by-law. In another set of by-laws a clause should be inserted giving latitude in certain cases.

Mr. Lewis Angell said the Local Government Board allowed no discretion at all, because committees might then get wire-pulled and make undue allowances and favouritisms.

Mr. Ralph Nevill, F.S.A., was afraid that London architects had little appreciation of the enormous difficulties encountered by the provincial architect, and he hoped something

would be done to enforce the revision of the by-laws. Local authorities had been anxious to adopt a system of modified by-laws, but the Local Government Board replied that the whole must be taken or none at all. He urged incessant application until some change was effected.

Mr. Maurice B. Adams, F.R.I.B.A., said the surveyor should be allowed to use his discretion in the matter of by-laws, and Mr. Charles Hadfield, A.R.I.B.A. (Sheffield), hoped the Institute would press the matter. Mr. A. E. Sawday, F.R.I.B.A. (Leicester), said that the insistence on the by-laws being complied with often increased the price of work, and clients went from architect to builder. Mr. Lacy Ridge said that it was not the Institute's business to take action. Local authorities could best be influenced by the local architects.

MUNICIPAL BUILDINGS—WHO SHOULD DESIGN THEM?

After the by-laws question had been finished with, a discussion took place on the resolutions proposed with regard to architectural work being executed by borough engineers and surveyors who have received no architectural training. These resolutions were:—

1. That in the interests of architecture it is inexpedient that buildings of a municipal character be designed and erected by engineers or surveyors having no architectural training.
2. That as a matter of sound finance, and in the interests of ratepayers, it is desirable that the duties of the borough engineer and surveyor should not include work of an architectural character.
3. That it is detrimental to the interests of the architectural profession that buildings of a municipal character should be designed and erected by the borough engineer and surveyor.

The first resolution was seconded by Mr. J. D. Mould, F.R.I.B.A. (Manchester). A letter was then read from Mr. Henman, pointing out that the wording was ambiguous, and suggesting a new form for the resolutions by combining all three in one; but eventually this was ruled out of order.

Mr. H. H. Statham, F.R.I.B.A., took it that the real object of the first resolution was purely an artistic one, that architecture should not be placed in the hands of the municipal officer. Routine work and genius did not go hand in hand—witness the post office buildings of one pattern throughout the country.

Mr. H. H. Langston, A.R.I.B.A., was not a sympathiser with the resolutions. If they meant anything, it was that engineers and surveyors should be ridden down as men incompetent and unable to be entrusted with the carrying out of buildings erected at the ratepayers' expense. He could not see what the architects were driving at, unless it were envy. Suppose an architect without employment obtained the post of borough surveyor. Was that to prevent him making his position a stepping-stone through his architecture?

Mr. Statham then moved the following amendment:—

That in the interests of architecture it is inexpedient that important buildings of a municipal character be designed and erected by the official engineer or surveyor to the municipality.

Mr. Charles Hadfield (Sheffield) moved that the first of the resolutions be passed. In the course of his remarks he said:

In moving this resolution it is far from my intention to utter any words of disparagement of the work of the civil engineer, of the land surveyor, whose calling, like our own, demands the exercise of high skill and ability, and who are all engaged in work of the first importance to the common good, much of it, moreover, being work which calls for sympathy and co-operation with that which is peculiarly the province of the architect.

I need scarcely allude in this connection to the laying out of estates for building, and the formation and improvement of the arteries of our rapidly growing towns and cities, work on whose success the best efforts of the architect's craft are dependent. I would yield to no one in expressing a thorough appreciation of the inventiveness and skill evolved in the carrying out of these public works, or of those great mechanical structures which will, perhaps, form the special distinction of the nineteenth-

century engineer. But I fail to comprehend how the training of the civil or municipal engineer, or the land surveyor, or the many diverse duties which fall to his lot, can possibly qualify him to originate or to carry out architectural work of a character high enough to appeal to any man or woman of average culture, in an age when appreciation of great works of the architect is considered a part of a polite education. I define good architectural work to be that which is the peculiarly artistic outcome of skilful planning and sound construction. Both equally appertain to a plain building devoid of what are popularly styled "architectural features," and to a highly elaborated building—and I venture to submit that you cannot expect to get individuality, originality, and interesting design without a well-ordered architectural plan. I think, too, you will also agree with me these qualifications cannot be attained by the aid of "ghostly agency." Beyond all question "municipal buildings of a public character," such as town halls, public baths and libraries, hospitals, police and fire brigade stations, markets and industrial dwellings, demand the particular skill of the architect, whose especial province it should be to impress upon these works the marks of his intimate study of planning and design—and of that individuality which can never appertain to official architecture. With all our shortcomings this individuality has been recognised by foreign critics to be a distinctive quality of the best modern English architecture. I feel strongly that the system of conducting important building operations, which has commended itself to the British public for the last fifty years, and which is now undoubtedly bidding for an increased sphere of influence, ought to be discountenanced, as being at variance alike with common sense and public utility. It is a system which is not tolerated by enlightened public opinion on the Continent, and I am glad to learn that the American Institute of Architects has been taking concerted action on this subject for some time past, and with success; for they have brought about a considerable reform in the direction of removing architectural work from the control of the official surveyor.

I feel that I am speaking for most of you in expressing my own sympathy with the wide extension of municipal energy, which is one of the great progressive forces of our day, and I think I may fairly say that such a sympathy tends to increase one's regret that the great changes which this municipal enterprise is bringing about should result in unconsciously lowering the standard of national architecture, instead of being the means of fostering it; and that this, too, should happen at a time when, thanks to the educational advances of recent years, a marked increase in skill and originality may be looked for.

Municipal and Governmental enterprise is more intelligently developed in this direction in France, Germany, and elsewhere on the Continent than it is at present in this country, adapting itself, as it does, to the æsthetic feelings of the people at large, and one is glad to note that already the representatives of more than one of our important municipalities are beginning to appreciate the fact. In the Middle Ages, from the time of the social movements of the thirteenth century, the spirit which is actuating our great municipalities to-day was the factor which called into being the best efforts of the architectural craftsman throughout Europe, and made architecture *par excellence* the art of the people, and England from the thirteenth down to the eighteenth century was no exception in this respect, as many of our older towns and hamlets still bear evidence. I regret to say, however, that such evidence, at the inappreciative touch of the surveyor-architect, is becoming a vanishing quantity. The ruin worked in this respect, notably in the last twenty-five years, is known only to those of us who devote holiday weeks or days to looking up the legacy left by a past which appreciated architecture at its true value; and it is against this all-round vulgarising and lowering of the standard of architecture to serve the needs of a grasping, sordid commercialism—never perhaps more in

evidence than it is to-day—that I have ventured upon these few remarks.

Mr. Statham's amendment was seconded by Mr. Maurice B. Adams, who said that the architects had no intention to set themselves against the surveyors. Mr. Angell opposed the amendment. Mr. Lacy Ridge said he should be sorry if the Institute passed any such resolutions as those proposed. No good would be effected, it would be bad taste, and he felt sure that not the slightest attention would be paid to the matter. Mr. Hudson thought also that if the resolution were passed it would be a dead letter. It would be just as pertinent for the engineer to say that the architect should have nothing to do with the sanitation and drainage. Mr. Langston (who afterwards left the room in disgust) trusted the vote would not be taken. Were they so perfect with an architectural training? "Let him who is without sin cast the first stone." Mr. Neville was against the resolution. Persons could turn to many municipal buildings erected by architects, and could say, "Is this, or this, or this beautiful?" Several other gentlemen spoke, but eventually Mr. Statham's amendment was carried by 14 votes to 5. It was then put as the original motion and carried.

In moving the second resolution Mr. Sawday said that £1,000,000 worth of architectural work had been carried out during recent years at Leicester by the borough engineer and his staff; a great deal of work had also been done outside the official department, with more satisfactory and economical results. Mr. Statham thought that the passing of the first resolution was sufficient; Mr. Angell agreed, and the second resolution was withdrawn; the third resolution was also withdrawn.

VISITS TO PLACES OF INTEREST.

In connection with the Congress a number of visits to places of special interest to architects were paid during the week. On Wednesday afternoon a party of 180 visited the new Westminster Cathedral. Mr. J. F. Bentley, the architect of the building, was in attendance, but owing to his ill-health the Rev. Canon Johnson conducted the party, and explained the features of the cathedral. Mr. Charles Hadfield, of Sheffield, one of the best known Roman Catholic architects in the provinces, was also present. His Eminence Cardinal Vaughan entertained the party at tea at his house, where a model of the cathedral was exhibited.

On Thursday morning a visit was paid to the University College Hospital Extension in Gower Street, when Mr. Alfred Waterhouse, the architect of the building, acted as guide. The afternoon of the same day was devoted to visits to Stafford House and Bridgewater House. On Friday, the works of two important firms widely differing in character but each of special interest to architects were visited, namely, Messrs. James Powell and Sons' Glass Works at Whitefriars, and Messrs. Holloway Brothers' Building Works at Westminster.

On Saturday about a hundred ladies and gentlemen went down by steamer to Greenwich Hospital, where they were met by Mr. William Crisp, C.E., of the Royal Naval College. After inspecting the buildings, they proceeded across the park and took tea at the invitation of Mr. Thomas Dinwiddy, F.R.I.B.A., at his residence, the Manor House, Blackheath. Altogether the excursion was a most enjoyable one. Mr. W. J. Locke, B.A. Cantab, secretary of the Institute, acted as leader.

An International Tramways Exhibition was opened at the Royal Agricultural Hall, Islington, on Saturday last. At the private view Mr. W. H. Dickinson, Chairman of the L.C.C., reminded his hearers that electricity is much cheaper than horses. In Glasgow the two systems have been running side by side, and electricity pays better by 4½d. per car mile, which on our present London tramways would give an economy of £562,000 a year, equal to an all-round reduction of rates of 3½d., or to a decrease of fares by 40 per cent.

Keystones.

New Military Hospital.—Sixty acres of land have been purchased at Alton, Hants, to build a military hospital for returned invalids from South Africa. It is stated that accommodation will be provided for quite 500 invalids.

New Public Buildings at Helmsley, Yorks.—On Wednesday last the Duke of York laid the foundation-stone of the new Court House, Town Hall, Market Hall and Public Library now in course of erection at Helmsley.

A Flawless Block of Fine Gritstone weighing 500 tons was recently lowered in Stancliffe Quarry, Darley Dale. The greater part of it will be used for sculptural purposes on the additions now being made to the Walker Art Galleries, Liverpool.

Royal Victoria Infirmary, Newcastle-on-Tyne.—The foundation-stone of this building was laid by the Prince of Wales on Wednesday last. Mr. W. Lister Newcombe, F.R.I.B.A., of Newcastle, and Mr. H. Percy Adams, F.R.I.B.A., of London, were the joint architects.

New Pier for North Woolwich.—The Great Eastern Railway Company are constructing a new pier for North Woolwich. It is being built in the docks, and it is expected will be moved into position in about two months' time. The new pier will cost more than £30,000.

A Memorial to Sir Thomas More has been placed in the church of St. Lawrence Jewry, E.C. It takes the form of a stained-glass window, 14ft. by 7ft., and was unveiled by the Speaker of the House of Commons on Friday last. The window was designed by Mr. George Ostrehan and executed by Messrs. Joseph Charter and Sons.

Dundee Institute of Architecture, Science and Art Competitions.—The 1900-1901 syllabus of competitions held by this Institute has been issued. We note that Nos. 3 and 4 (the former for a water-colour study of an existing building, and the latter for a design of carved wood panels) are open to any person under twenty-five years of age residing in Forfar, Perth, Fife, Clackmannan, or Kinross. Mr. Charles G. Soutar, 5, Whitehall Street, Dundee, is the hon. secretary of the students' section.

The Annual Dinner of the R.I.B.A. was held on Friday evening at the Whitehall Rooms. Mr. W. Emerson, the president, was in the chair, and the Duke of Cambridge was one of the guests. Among others present were the Archbishop of Canterbury, the Bishop of London, the Lord Mayor, Lord Strathcona, Lord Alverstone, Lord Claud Hamilton, Lord Welby, Sir E. M. Thompson, Sir H. H. Howorth, M.P., Sir B. Stone, M.P., Sir H. Trueman Wood, Sir J. Taylor, Sir T. Drew, president of the Royal Institute of Architects in Ireland, Sir W. B. Richmond, Sir L. Alma-Tadema, Mr. T. W. Russell, Sir W. Bayliss, Mr. Gregory, and the presidents of a number of the scientific and other learned societies.

"Competitions Again."—Under this title on page 368 of last week's issue was recited the strange action of the Carlisle School Board with reference to the competition for a new higher grade school. The Board has now decided to publish the report of their assessor (they declined to produce it before), who says in his general remarks:—"I am of opinion that the four plans marked 'C' (Messrs. Castiglione and Gibbings), 'E' (Mr. G. Armstrong), 'G,' scheme J (Mr. T. Taylor Scott), and 'H' (Messrs. Oliver and Dodshun) possess the most merits and are deserving of the premiums to be awarded. I have not been asked to place these plans in order of merit but am prepared to do so if requested." It would be interesting to know on what grounds the Board decided to discard the recommendations of the assessor, because of the four designs selected by him only two are included in the Board's award.

Deputy-Surveyorship, Barry.—Mr. E. Finchcliffe, of Crewe, has been appointed to his post at a salary of £175 a year. There were thirty-nine applications.

The Wallace Collection.—The magnificent collection of art treasures contained at Hertford House, Manchester Square, was formally opened by the Prince of Wales on Friday.

The County Surveyors (Ireland) Bill has read a second time in the House of Lords on Friday. Its object is to obviate the unnecessary examinations which county surveyors in Ireland now have to undergo.

A new Observatory at Grimsby was opened on Thursday last. It is situate in the People's Park and has been presented by the Mayor, in commemoration of the Queen's eightieth birthday. The tower is 50ft. high, and is surrounded by a balcony.

The Society for the Protection of Ancient Buildings held its annual meeting in the meeting-room of the Society of Antiquaries, Burlington House, on Wednesday last. The attitude of Lord Curzon in regard to the ancient buildings of India was noted with satisfaction. It was regretted that Newgate

prison was to be demolished, and a committee reported that they had impressed on the London County Council that it was worth some sacrifice to preserve some of the old houses on the west of Lincoln's Inn Fields.

Change of Address.—Messrs. B. Ward and Co. have removed from 15, Great George Street to new offices at 38-9, Parliament Street, Westminster, S.W.

"Architectural Review" Competition.—Owing to difficulties in obtaining site plans, the closing day for this competition (which is for a villa on the Riviera) has been postponed.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDING—			
June 29	Gowerton, Wales—School	School Board	W. Jenkins, Dunraven House, Gowerton.
19	Irvinestown, Ireland—School		Henry Armstrong, Irvinestown.
29	Stockport—Fire Station	Watch Committee	J. Atkinson, Borough Surveyor, St. Petersburg, Stockport.
30	Bristol—Reconstructing Bridge	Docks Committee	W. W. Squire, Engineer, Cumberland Basin, Bristol.
30	Brighton—Villas	Freeholders of the Madeira Estate	J. M. Ferguson, 8, Quality-court, Chancery-lane, E.C.
30	Witham—Bridge	Essex County Council	Chief Surveyor, County Offices, Chelmsford.
30	Gwinear, Cornwall—Additions		Sampson Hill, Green Lane, Redruth.
30	Ippleton, Devon—Farmhouse	R. Meddicott	S. Segar, Architect, Union-street, Newton Abbot.
30	Leeds—Houses	A. Webster	W. H. Beevers, 26, Bond-street, Leeds.
30	Llangollen, Wales—House	E. Evans	16, West-street, Llangollen.
30	Old Hartley—Church		B. Dickinson, Secretary, Old Hartley.
30	War Dept. Contract, Ballincollig, Cork—Stables, &c.		Royal Engineer, The Barracks, Cork.
30	Warwick—Buildings	Managers of King's Middle School	R. C. Heath, 1, New-street, Warwick.
July 1	New Ferry, Cheshire—Bowling Pavilion	Lower Bebington U.D.C.	Surveyor, Council Offices, New Ferry, Cheshire.
2	Bury—Rebuilding	George Street Brewery Co. Ltd.	J. Grundy and Sons, 12, Brazen-nose-street, Manchester.
2	Bury, Lancs.—Hospital	Health Committee	Pole and Little, 9, Gray's-inn-square, London, W.C.
2	Exmouth—House	W. Sansom	P. Sherwin, Architect, Manchester-street, Exmouth.
2	Hull—Larder	Guardians	Freeman, Son & Gaskell, Albert-chmbrs., 11, Carr-lane, Hull.
2	Loughborough, Leics.—Alterations	Town Council	A. H. Walker, Town Offices, Loughborough, Leicester.
2	Peterston-uper-Ely, Wales—Additions	Rev. Canon Roberts	G. E. Halliday, Architect, Cardiff.
2	Rawtenstall, Lancs.—Church		Austin and Paley, Castle Park, Lancaster.
2	Southwam, Yorks.—Alterations, &c.	School Board	Walsh & Graham, Lancs. & Yorks. Bank-chmbrs., Halifax.
2	Oxford—Public Conveniences	Corporation	City Engineer, Town Hall, Oxford.
3	Bristol—Alterations and Additions	New Streets Committee of the Corpor.	T. H. Yabbicom, 63, Queen-square, Bristol.
3	Cleethorpes, Grimsby—Schools	School Board	Croft and Bentley, Osborne-street, Great Grimsby.
3	Burton-upon-Trent—Bubble Wall	Corporation	G. T. Lynam, Town Hall, Burton-upon-Trent.
4	Ellesmere, Salop—Shelters	Urban District Council	R. E. Lloyd, Clerk, Ellesmere.
4	Barnstaple—Homes	Guardians	W. C. Oliver, Architect, Barnstaple.
5	Cork—Dwellings	Corporation	H. A. Cutler, City Engineer, Cork.
5	London, S.E.—Offices	Guardians of St. Saviour's Union	G. D. Stevens, 13, King-street, E.C.
5	Sheffield—Hospital	City Hospital Committee	C. F. Wike, Town Hall, Sheffield.
5	Spennymoor, Durham—Alterations	Tudhoe School Board	Mr. Rogers, Surveyor, Silver-street, Spennymoor.
7	Chesterfield—School	School Board	W. Cecil Jackson, 29, Knifesmith Gate, Chesterfield.
7	North Ormesby, Middlesbrough—Police Station		County Surveyor, Northallerton.
9	Armagh—Alterations	Asylum Governor	J. C. Boyle, The Mall, Armagh.
9	Beckenham—Brick Transformer Stations	Urban District Council	J. A. Angell, Council Offices, Beckenham.
9	Bexley, Kent—Farm Buildings	Asylums Committee of the L.C.C.	Clerk, Asylums Committee, 6, Waterloo-place, S.W.
9	London, E.—Town Hall Extension	Shoreditch Vestry	Clerk, Town Hall, Old-street, E.C.
10	Brighouse—Laundry	Joint Hospital Board	Sharpe and Waller, 32, Brailford-road, Brighouse.
14	Donaghadee, Ireland—Villa		W. J. Fennell, Scottish Provident-buildings, Belfast.
14	Farnborough—Cottages		W. T. Taylor, County Surveyor, The Castle, Winchester.
16	Hellingly, Sussex—Asylum	Urban District Council	R. Blaker, 211, High-street, Lewes.
16	Wimbledon—Alterations	School Board	Council Surveyor, The Broadway, Wimbledon.
17	Patcham, Sussex—Premises	Visiting Committee	Clayton and Black, Architects, Patcham.
21	Bodmin—Farm Buildings	Corporation	R. P. Edyvean, Clerk, Bodmin.
30	Cardiff—Town Hall and Law Courts		Town Clerk, Town Hall, Cardiff.
ENGINEERING—			
June 29	Hartlepool—Reservoir	Corporation	Martin and Fenwick, 1, Park-place, Leeds.
29	Hull—Bascule Bridge	Rural District Council	City Engineer, Town Hall, Hull.
29	Walsall—Pump Well	Tramways Committee	F. W. Mager, District Surveyor, Aldridge, Walsall.
30	Manchester—Overhead Equipment	Gas Committee	J. M. McKilroy, Tramways Dept., Town Hall, Manchester.
30	Carlisle—Water Gas Plant	Corporation	C. B. Newton, Gasworks, Carlisle.
30	Dudley—Condensers		R. P. Wilson, 66, Victoria-street, Westminster.
July 1	Alexandria, Egypt—Generating Machine	New Streets Committee	Controller-General Ports and Lighthouses, Alexandria.
3	Bristol—Bridge	South Indian Railway Co. Limited	T. H. Yabbicom, 63, Queen-square, Bristol.
3	London, E.C.—Engines and Tenders	Tottenham Urban District Council	South Indian Railway Co., 55, Gracechurch-street, E.C.
3	London, N.—Fire Alarm Posts	Middlesex County Council	E. Crowne, Coombes Croft Ho., 712, High-rd., Tottenham.
3	Walton-on-Thames—Strengthening Bridge	City Council	H. T. Wakelam, Guildhall, Westminster, S.W.
4	Limerick—Electric Lighting	Corporation	J. Enright, 47, Victoria-street, London, S.W.
5	Taunton—Filters	Consumer's Gas Co. Ltd.	Borough Surveyor, Taunton.
5	Northallerton—Exhauster	Rural District Council	J. A. Squire, Consumers Gas Co. Ltd. Gas Committee.
5	Uxbridge—Bacteria Beds	Spanish Government	Denton, Son, and Lawford, Palace Chambers, Westminster.
7	Madrid—Electric Tramway	Lancashire County Council	Commercial Department, Foreign Office, S.W.
9	Haslingden, Lancs.—Bridge	Corporation	County Bridgemaster, County Office, Preston.
9	Swansea—Reservoir	Urban District Council	E. H. Wyrle, Guildhall, Swansea.

No. CCLXXXII.

EFFINGHAM HOUSE,
ARUNDEL STREET,
STRAND, W.C.

An Architectural Causerie.

New Sessions House Designs. We commented last week on some general characteristics of the designs for the

New Sessions House, and on Mr. Mountford's design in particular. Of the unsuccessful designs, that by Mr. Florence seems to us to be in many respects superior. There seems to be a general ruling idea in the plan which the rest of them lack. It is set out more on good architectural lines, which lead to finer effects. On entering, the vista is straight before one; we have not to turn to right or left to be struck with the effect. The central hall or wide corridor, running from front to back, produces naturally a grand central feature in the front, which is emphasised by a large pediment accentuating the entrance. The flanking colonnades to right and left suggest the presence of the courts, and if the two projecting blocks which balance one another are not exactly expressive of the plan, at least the right-hand one has perhaps sufficient excuse. The weakest part seems to be the treatment of the left-hand projection, and the return to Newgate Street, where the elevation is treated in a purely arbitrary manner which is false in effect. Mr. Florence seems to have treated the design more on its own merits than any of the others, and not to have been misled by a fancied necessity to over-use rustications. We cannot say that we think it shows any more of the special sentiment or character of the building than do the other designs; but, taking it all round, it strikes us as the most genuine attempt to produce architecture. The arrangement of the courts with the tower and staircase on the central axis is very pleasing in effect, and is probably as convenient on the principal floor as any other; but it leads to a difficulty with the stairs to the docks, which come down in the centre of the rooms below. The ground floor is, by contrast, rather chaotic, but not much, if at all, worse than the rest.

Mr. Belcher has a design which is interesting. In its general arrangement the principal difference is the state entrance for the Lord Mayor at the angle of the two main streets. Although at first sight it may seem the right idea to place a principal entrance at the corner of a site with two frontages, yet, in this case, we think it a mistake, as the rest of the plan cannot be arranged to suit. The *porte-cochère* for the use of a state coach and four-in-hand is a mockery—the curve should have been concave, not convex; the circular hall spoils the rooms each side, and leads to awkward shapes everywhere; and the outside effect of it all is far from happy. As a plan, we do not think it compares favourably with Mr. Mountford's. The ground floor is not so

well lighted, and the arrangements are not so convenient. We doubt the convenience of bringing in the general public to the galleries at the main entrance. Probably it was a mistake to place a court to the extreme right of the plan—it seems more natural to keep all the courts in the main part of the site. As regards elevation, the main wall between the large features, where treated with pilasters, would look well, and it seems the right thing to accentuate the large hall, but we cannot say we like the way it is done. The author has managed to express some of the main

Brydon. It is not necessary to point out how false and inartistic this effect is, how little it expresses the plan and arrangements. That sham-screen wall forming the return of the attic is as bad as that at St. Paul's. Has there been no progress in ideas since then?

But, however much we may condemn the general treatment of this scheme, we must do what justice we can to any good points, one of which seems to us to be the corridors between the courts, which give better access to them than is to be obtained in Mr. Mountford's scheme; though on the other hand the

DESIGN FOR COVER OF CATALOGUE BY C. ANGUS.

facts of the scheme in his elevation, and has not gone out of his way to produce arbitrary breaks and features of all sorts, in which respect he compares favourably with most of the others.

We are particularly disappointed with Mr. Brydon's design. Mr. Brydon has a reputation for quiet sensible work that was pleasing and artistic. This design goes near to ruining it. We remember no greater artistic mistake than this, by any man with pretensions to the name of architect. We could have understood some people doing it, but not Mr.

arrangement of the judge's rooms is not so good. Some of the internal effects promise well, and no doubt there are many good points, but we find all interest or pleasure in looking at it entirely spoilt by the front elevation.

In the design by Mr. Hare the same fault is noticeable; the front elevation is not the natural expression of the plan. It is not difficult to design an arbitrary elevation if we neglect its connection with the plan. The difficulty is to design the plan so that it will naturally produce a fine effect in elevation.

This is where the skill of the architect is shown. The plan itself is simple and straightforward, and the courts seem well arranged, but here again all interest in the design is destroyed by the fact that the elevation is a sham. In itself this elevation is pleasing enough, it is broad and simple, and seems to have been inspired to some extent by Newgate prison—but, as the expression of the building, what value has it?

Mr. Baggallay has a plan which seems to have many good points. Some of his arrangements seem excellent. The main feature of his scheme is the manner in which he has modelled and cut up the main front of the building; presumably a reminiscence of Newgate. This arrangement does not seem to us to be satisfactory. On looking at the perspective one sees three large projecting blocks which one naturally supposes to be large and important rooms, presumably the courts. An examination of the plan shows them to be made up of large and small rooms and staircases, which, by this treatment, have an importance on the outside out of all proportion to their relative value in the whole scheme; and these large blocks are also treated in a way that does not express what is inside. The elevation is pleasing in detail, though it seems a little too ornate in parts, and the general effect does not strike one as being so dignified as some of the others. As plan, however, this design compares very favourably.

It is much to be regretted that so many of the designs show such utter contempt for one of the first and most important principles of design, viz. that the plan must express the elevation, and that neither elevation nor plan must be tortured to suit the other. We hear a great deal about this principle in lectures and papers, and at such functions as prize distributions and presidential addresses, when it is laid down and expounded with much righteous emphasis. When we see our leading men, chosen by our leading society, calmly ignoring this principle, what are we to think of the value or sincerity of the utterances with which we are so familiar? And what right have their productions to be considered as architecture at all?

It seems to us that the assessor in a competition for which such productions are submitted is in rather a difficult position. He is there as an architect, to judge architecture. As such, he should confine his attention to such works as come under that definition. If he is to take himself and his position seriously, and to act logically, what other course is open to him than to disqualify all such designs? Possibly the promoters may only require convenient buildings, in which case they should not invite an architect to judge them. Should this be so—as we suspect is very often the case—and should an architect be asked to arbitrate, would it be his duty to select only from the works of architecture, and to submit the rest of them to the promoters with the remark that while not coming within his province they may yet possibly be the sort of things that are wanted?

Whatever may be the most reasonable course of action, it seems to us that the present method, whereby competitions in architecture are promoted, architects invited to compete, an architect appointed assessor, and then works which violate the fundamental principles of architecture admitted and sometimes even selected as the best—such method seems to us to be neither logical nor just. How much longer are our ideas to remain in a state of chaos?

A. R. J.

On Reflection.

Quantity Surveyors' Fees.

THE case of *Mellor v. Britton*, reported in another column, revives the old question of the expediency of the quantity surveyor being paid by the builder. The custom is that the builder, on receiving the first instalment under his contract, pays the quantity surveyor's fees, and in straightforward building there is no objection to this procedure; but when the relations between the parties are at all complicated, or the work is a pure bit of speculation, there are plenty of opportunities for trouble. In the present case the defendant was contractor for a piece of speculative building, and his contract made provision for the payment of the quantity surveyor's fees on receipt of his first instalment. When this payment became due the building owner, being unwilling or unable to pay, compromised with the defendant by assigning to him, lock, stock, and barrel, the whole of his interest in the undertaking, and the latter endeavoured to resist the plaintiff's demand for fees on the novel ground that, as he had not received an instalment from the building owner, he was not liable for the amount. The defendant lost his case, it being decided that the amount of work that had been done would have enabled the building owner to raise money to meet the instalment if he was pressed; but the builder having agreed to accept the assignment of the building agreement in lieu of cash, he was not entitled to disregard the claim of the plaintiff for his fees. This case has its peculiarities, of course, and it discloses a new ground for disputing the quantity surveyor's fees, but we have never yet been able to understand the reason for including these fees in the contract price at all. It is no advantage to anybody. The architect, fearing to lose his client, does not mention the quantity surveyor; the client refuses to pay his fees because he was not informed about them, and sues the architect for damages; the builder sues the owner for the amount of the surveyor's fees, and the latter sues the builder. And all this accumulation of evils comes from perpetuating a silly and nonsensical custom that should long have been consigned to oblivion. If the owner paid the quantity surveyor direct, he would understand from the beginning that the latter's fees are additional to the architect's; the architect who gets out his own quantities would not be suspected of receiving illicit commissions, and the quantity surveyor would not have to resort to the Law Courts so frequently. In addition it is more fitting, from a professional standpoint, that the surveyor should be employed and paid direct by the owner.

The Rent of Flats.

It was a slangy and laconic speculative builder, who, being asked what class of people inhabited flats, said, "Flats!" Doubtless from his point of view (he had built several blocks) he was right. The occupier rarely cares to know how his residence is built, and it is well sometimes for his peace of mind that he doesn't. But for many people flats have a convenience that cannot be denied; married couples without family, widows or widowers, bachelors, or people who have to travel a good deal, find them a convenience. But the rents that are being asked for the flats about London are really extortionate. No doubt the original idea in erecting flats was to enable families of moderate means to live in good residential districts by putting them one above the other instead of side by side. But flats no longer cater for people of moderate means, and if you ask the builder why, he will tell you that the ground rent is so enormous. It is a curious thing this ground rent. Land

in outlying suburbs which a year ago could fetch nothing exceptional in the way of ground rent is now being covered with blocks of flats at enormous rentals—enormous because of the heavy ground rent. Two curious instances of the high price of flats have recently come under our notice. In an outlying western suburb a new type of flat is being erected. These flats are built in rows, ground and first floor, and in appearance are exactly like the rows of small houses that abound all over London. Moreover, they occupy just about the same ground space, and are just as flimsily built. The ground and first floor flats have front doors side by side, that for the first floor opening direct on the stairs, which, being of wood, can easily be set alight to by the people in the lower flat, who have a cupboard underneath. And the owner is asking and getting £35 and £40 for these places, so that for a building occupying the same space as a £25 house he is getting £70 to £80 a year. The other case concerns some flats of a superior character, built in blocks of six, in three floors, and letting at £50 per annum each. At the back of these flats, fronting another road, some semi-detached villas are being erected at a rental of £50 a year. The ground space occupied by each villa is rather more than that occupied by one of the flats, and in addition the rooms are larger and better lighted, and the accommodation is greater. So for a smaller ground space the owner of the flats is getting three times as much rent as the owner of the villas next to them. Proportionately it is cheaper to live in Park Lane than in a Kensington flat. No wonder that the public is awakening to the fact that the advantages of flats are more apparent than real.

Saner Judgment Asked for.

THIS is the day of cheap travel, but there are dangers in the path of the traveller which are not mentioned in the guide-books. One of these is the danger of over-rating or under-rating prominent features in the country being visited, in allowing novelty to distort true judgment, or in failing to appreciate the real value of things because of national prejudices; and these remarks are particularly applicable to European countries. While the Briton secretly prides himself that his nation has neither the fickleness nor the sensualism of the French, the awkward ponderousness of the Germans, the ignorance of the Italians and Spaniards, nor the cruelty and dirtiness of the Turks, he will often exaggerate the merits or faults of these countries on the very first occasion he has of visiting them, and he is exceedingly prone to draw comparisons—of course, to our detriment—of the ways in which matters are managed here and on the Continent. For instance, a man goes to Normandy, and he comes back and tells you of the quaintness of the architecture, and how picturesque everything is, but he omits to discover that rooms are stuffy, or draughty, and decent sanitation is unknown. St. Malo is a charming old town to look at, there is a mediaeval aspect about it, but some of its streets are no more than 10ft. wide, and it can hardly be called satisfactory to empty slops out of the window into a zinc funnel forming the top of a pipe that runs down the wall to the street level. We hear a great deal of talk about Paris just now; its bridges are splendid, its sculpture is excellent; but it has many features which one would be sorry to see introduced here. All that is asked is that travellers should try to form a fair judgment of what they see, and not let their imaginations, or their ignorance, dominate them; and in all cases to give the benefit of a doubt to their own nationality; to be as patriotic in these matters as they are with regard to the excellence of their policeman, the superiority of their fire-brigade, and the defence of their country.

ARCHITECTURAL DRAWINGS BY RONALD P. JONES.

LIVERPOOL SCHOOL OF ARCHITECTURE AND APPLIED ART.

EXHIBITION OF WORK.

FOREMOST amongst the Exhibitions held at the Walker Art Gallery, the annual one consisting of the work of the students of the above school is rightly taking its place as one of real interest to the lover of art and the citizen alike. Out of a veritable chaos which enveloped all effort subsequent to the foundation of the School in 1895, light and order are gradually merging; and this collection of work, opened recently by Sir William Forwood before a representative gathering, shows that already the influence of the school is being felt far beyond its immediate student roll.

The aim of the school is such as must necessarily take years of hard, persistent, and well-directed labour to attain. It is no less a one than to fathom deeper than the shallow waters in which the mere amateur finds pastime in the playful handling of the brush, the pencil,

or the chisel, and to sound the genuine artisan, who is too apt to be looked upon as a machine, systematically resigning his will, his taste, his talent maybe, to the exigencies of a lifeless trade. Through him eventually the everyday production of everyday articles of need, use, and enjoyment must be set upon a higher plane. This is no small ambition, but already the stone-carver poises his mallet and wonders if it is sufficient reason for him to be hewing such senseless forms, that hundreds of others have done the same before and are still doing them; and the smith leans on the anvil and hesitates before he distorts and twists his metal into such well-worn meaningless curves. The main result is that the artisan or craftsman is being helped to think for himself, to throw off the shackles which have bound him hand and foot so long, and to look upon his material in a manner he never did before. Thus in the exhibition much more stress must be laid upon the works in wood and stone or modelled for translation into such, in copper and brass, in iron, in embroidery, and in stained glass, than upon the easel productions

in oils or chalk, which, though necessarily given a prominent place, may be seen to greater advantage at any school of art pure and simple. We see the result of these studies, however, in the designs for black and white and book illustration generally, for textiles, wall coverings and friezes, and for stained glass, where the figure is freely and fearlessly introduced as the central motif.

It is not possible to leave this section without singling out the admirably conceived and forcibly executed design work of all kinds by C. D. Angus, G. A. Williams, and O. Allen. Mr. Angus's design for the cover of the illustrated catalogue, reproduced on p. 395, is an entirely sumptuous and decorative piece of drawing. There is a distinction about the work of these students in particular not due to mannerisms but to a genuine artistic sense, and it would be well if such could be said of the design work as a whole. The student unfortunately is apt to assimilate whatever is faulty in his master's work rather than what is sound and lasting, and there is a marked leaning in many of the exhibits towards a morbid conventionality which has found its way south of the Tweed. It shows itself in the long, gaunt, shapeless type of figure, which never could exist in a healthy state, and which treats anatomy as a useless restriction; in a generally weird and unearthly aspect of things in general; and in bad and often illegible lettering

in particular. From such one turns with relief to the really healthy and vigorous work produced in the modelling studio under Mr. C. J. Allen, and in the brass and copper workshop under Mr. R. L. B. Rathbone. In these, as well as in the wrought-iron and wood carving, one sees at a glance that the limitations of the material have been realised, and that the design has been thought out with due regard to them, the result being that the restless straining after effect which mars so much of the work of the "new school" is entirely avoided.

Owing to the full scope allowed, the exhibits in applied design are very numerous. G. A. Williams, who has just been awarded a County Scholarship, scores many well-deserved successes with much thorough and consistent work, ranging from modelling and drawing from the life to modelled designs for silver, bronze, and plaster work. The monumental drinking trough here illustrated is full of refreshing suggestions for the treatment of a subject which by common usage has been degraded beyond all reason. It is shown in a plaster model, one-third full size, and consists of a granite base about 12ft. long, carrying a large bronze trough treated with broad, easy-flowing surfaces. The same student's designs

LES GARGOUILLES.

DESIGN BY C. ANGUS.

for a sun-dial in bronze, a dish in silver, and a scheme for the decoration of a room in coloured plaster are exceedingly happy.

The stained-glass studio has not long been in full working order, but already has produced some excellent pieces of coloured and leaded decorations. C. Meyer (another County scholar), C. Gwatkin, and M. Collins in particular have made rapid progress. One feels the simpler the arrangement the better the result is likely to be—in the panel of the former, for instance, a peacock's tail becomes confused when it is so conventionalised that each group of feathers has its own lead lines and colour; and in the work of the latter it is only after much attention and the exercise of no small amount of ingenuity that one can decipher the letters spelling "The Queen of Hearts" wrought in as part of the design and descriptive of it. This glass work is all cut and leaded by the students themselves.

Furniture design is not nearly so well represented as one might wish, considering that Liverpool—essentially a city of commerce and transit as distinguished from a city of manufacture—possesses quite its full share of cabinet

DESIGNS FOR COUNTRY HOUSE STABLES AND A MOUNTAIN CHURCH BY FRANK RIMMINGTON.

MODEL OF DRINKING TROUGH TO BE EXECUTED IN BRONZE AND GRANITE, BY G. A. WILLIAMS.

shops, representing a huge annual output of quite mediocre furniture and fittings.

Beyond the working drawings made by apprentices at the bench under a practical man, there is only one exhibitor who shows any serious attempts at putting thought and feeling into this most important craft. This is C. P. Wilkinson, and his work on paper commends itself to closer inspection than one would otherwise give, owing to the fact that two pieces of furniture actually carved out are successful and full of promise. We would point out, however, that in detailing such things it is of the greatest importance to consider the eye level: a flat projecting moulding may look admirable at a height of 6ft. or 7ft. from the floor, and be entirely out of place at a height of only 3ft. or 4ft., and we fear from his book cupboard that this has been rather lost sight of. The copper escutcheons upon it are very effective, and it is difficult to overpraise the other hammered and repoussé copper work shown by T. S. Pemberton, H. H. Eckstein, O. E. Thompson, H. B. Barl, F. Nachtigal and others, comprising a large variety of useful articles all designed with relation to the material and carried out in the best traditions of the craft.

The proportion of architectural drawings and sketches is one-third of the total number of exhibits, representing the work of students in various stages from their first year's acquaintance with a T-square to advanced compositions produced in the evening design classes, the whole being under the direct supervision of Professor T. M. Simpson and Mr. Arthur Stratton. In the design class, F. Rimington shows a set of five subjects rather weakly drawn but much aided by small perspective

sketches cleverly handled; A. Landstern, Guy Blood, and W. T. Clarke have also taken advantage of the opportunities offered by the class to practise the planning and composition of widely different classes of buildings without which no architect in these days can at all consider himself equipped to meet the many-sided demands made upon him. In this way thoughtful and workable schemes for "a mountain church," "a golf club-house," "a block of cottages," "a stable building," &c., have been produced from subjects set fortnightly during the winter terms.

The second-year students show an interesting group of designs for a country house fully treated as working drawings, and in the case of Ronald P. Jones further explained by a large scale model executed by himself. The same student shows several sketches in line and water colour made in English cathedral towns and in the ruined temples of Egypt, always truthful in the extreme, but rather thin and nervous in execution—faults which time and confidence will certainly remove. That the exhibition as a whole is a success nobody who visits it will dispute; that there is room for a higher standard of perfection no one will doubt. Let it be remembered that the training of the architect and the craftsman is a many-sided problem, the solution of which is beset by almost unsurmountable difficulties, and that any effort tending to raise the low dead level from which the country at large is as yet only beginning to arise, is worthy of all sympathy and support.

COLOUR IN ARCHITECTURE.

By A. TROYTE GRIFFITH.

I.—ITS AESTHETIC VALUE.

It is a curious fact that, though the element of colour is felt by everyone to be a most important factor in architectural effect, yet, with one great exception, architectural historians have usually afforded the most cursory treatment to this branch of the subject. Certainly the history of architectural development and the criticism of master-works of all ages may be written with very small reference to colour and colour decoration in a perfectly logical and scientific manner. But, after all, these are only the dry bones of an art, and if architecture is investigated on the lines of comparative osteology we shall never arrive at the vital principles that inspired the builders of previous ages, nor at the true spirit of the buildings themselves.

For a considerable period architecture has followed lines of development on which colour,

in the broadest meaning of the word, has had very small influence, and decoration in colour no influence at all; while painting, the expression of human emotions by the means of colour, in the most direct manner, has thrown off the guidance and restraint of architecture, and risen to a pre-eminence hitherto unknown in the history of art. Our houses and galleries are stored with pictures, often consummate harmonies of tone and colour, yet created with no consideration for their ultimate surroundings. On the other hand, the buildings themselves are designed and erected with no more regard to colour than may be contained in the question whether green slates or brown tiles be used for the roof or red bricks or yellow for the walls.

At previous periods of great artistic activity, before painting had become a separate art, the element of colour entered extensively into architectural effect; but since the discoveries and improvements in the methods of drawing and light and shade, in the fifteenth and sixteenth centuries, the influence of colour has mainly been confined to the pictorial arts. That the advancement of painting would of necessity react on architecture was soon shown by such buildings as the Arena Chapel at Padua, and the Sistine Chapel at Rome, but that it should ultimately deprive architecture of the use and enjoyment of colour was far from the intention of Giotto or Michael Angelo. Such, however, has been the result, but whether the irretrievable result remains to be seen.

It is, perhaps, advisable to clear the ground by a brief definition of colour and sight. The sensation of sight is produced by the action on the retina of the eye of very minute waves, transmitted from the objects seen. Waves of a certain length produce the sensations known as redness, and waves of other lengths produce sensations of other colours. So that colour is an internal sensation, and has no existence as colour outside our eyes, and it is impossible to see forms apart from colour sensations of varying intensity. These colour sensations are probably the readiest means of affording æsthetic pleasure to mankind. Savages almost invariably take delight in simple combinations of colour, as may be noticed in their weaving and basket-work. And although civilisation has developed the distressing disease of colour-blindness, yet so potent are the attractions of colour for even the most acute thinkers that the beauties of polarised light may be said to have given rise to an abstruse branch of mathematics.*

But in spite of the almost universal craving

* See Rood's "Modern Chromatics," Chap. XXIII. See also Church's "Colour," Chap. I.

NEW SESSIONS HOUSE: DESIGN BY H. T. HARE, F.R.I.B.A.

NEW SESSIONS HOUSE: DESIGN BY H. T. HARE, F.R.I.B.A.

for colour, it has often been stated that it is not essential, or even desirable, in architecture, and these beautiful effects which so readily touch the mind of man should be renounced by the architect. Strictly speaking, this is impossible. For what is building to us but colour? The most monochromatic building in the world is made up of patches of colour, which, by experience, we know to represent light and shade. Colour exists everywhere, in the sunlight and in the shadow; and as the painter cannot depict cavernous archway or salient cornice by mere washes of neutral grey, but requires every paint on his palette, so must the architect ever work with and even create colour, whether he will or not.

To determine whether any valid reason exists for the limitation of architecture to monochrome it will be necessary to analyse the elements of architectural effect. Without entering into a lengthy discussion of aesthetics, it may, perhaps, be assumed that the arts of form—architecture, painting, and the like—appeal to our minds solely by means of the sense of sight, and that the sensations thus received give us pleasure, firstly, because the objects seen are themselves beautiful, and, secondly, because they arouse in our minds other emotions, such as solemnity or terror. The latter may seem a bold assumption, in view of the controversies that have raged on this very point, from the eloquent expositions of the ethics of art by Mr. Ruskin to the amiable discourses of Mr. Whistler. But whatever opinions painters may hold as to the legitimate sources of effect in their own art, surely no one can assert that either Hellenic architects or mediæval church builders were solely actuated by the pursuit of the beautiful, that in a Parthenon, or a Notre Dame, they did not intentionally express some lofty spiritual ideal. In the same way different schemes of colour produce different *mental* sensations; the funereal hangings of a Good Friday service or the gorgeous colours of an elaborate ritual impress the worshipper quite apart from their actual beauty or ugliness. Instances of this psychological effect of colour might be indefinitely multiplied. It seems, therefore, a fair deduction that colour would be rather an assistance than an hindrance to the mental effect produced by architecture.

When we consider the other of the two sources of architectural effect, the element of beauty, the way is not so clear. Volumes have been written on the question of architectural beauty. But perhaps the definition of Vitru-

vius that a building should be stable, convenient, and beautiful is as comprehensive as any. Though the elusive quality of beauty is still undefined, two undoubted characteristics of architecture, stability and convenience, are thereby differentiated.

These qualities of stability and convenience will be found to fix certain limits to the use of colour no less than to other means of architectural effect, such as the height of buildings or the tenuity of supports. Convenience will prohibit arsenical colours or combinations actually painful to the eyes, stability will demand that the colouring be as permanent as the nature of the building requires. For instance, the Gothic builders could not be expected to anticipate a state of society which would tolerate the whitening of frescoes and the destruction of coloured windows, the very *raison d'être* of their architectural surroundings. On the other hand, the temporary expedient of painting that preserves our iron constructions from the ravages of the weather would insult the everlasting bridges of Rome.

However, the principal element of beauty in architecture is undoubtedly the sense of utility, the expression of the function by the form of the building, the expression of the construction in the decoration. Nevertheless, the maxim, "Build in truth," has the corollary, "Design with beauty." The architect is not precluded from creating beautiful forms apart from any constructive significance. The spire is no less legitimate as a means of architectural effect than the pinnacle; the mutules as justifiable on the front as on the side of the Doric peripteros. And, although decoration in colours may have no constructional significance, the addition of colour to architectural forms is not thereby condemned. It is the exaltation above the necessities of life, the disdain of all restrictions, that raises architecture to the supreme heights of art. The spire of Salisbury, the sculpture of the Parthenon, the mosaics of St Mark's, to mention the crowning glories of three typical buildings, can be ascribed to no necessities or suggestions of construction. That beauty of form is not destroyed by beauty of colour may be seen in every work of nature. Cloud forms are not more beautiful on a grey day, the contrast of red and green does not detract from the beauty of the rose, nor the butterfly lose grace of outline in gorgeous colour. Thus might it be again with architecture.

At this point it may be useful to recapitulate the foregoing argument. The pleasurable sensations aroused by architecture are of a

complex nature. They arise partly from certain mental associations or suggestions (which would on the analogy of other arts be increased by colour); partly from the feeling of stability and convenience of the building in question (which would impose certain limits to the unrestrained use of colour); principally, perhaps, from the high expression of the needs of man, both in the general purpose and in the subordinate details of building, rising at times to the sphere of pure beauty. And this ideal element in architecture will justify the addition of beautiful colour to beautiful forms, as is universally the case in Nature.

This theory must now be tested by an enquiry into the use of colour in those periods of art that have led to our present position. It will then remain to ask what deductions can be made with respect to the employment and value of colour in contemporary architecture.

II.—THE HISTORICAL USE OF COLOUR IN ARCHITECTURE.

Egypt.

Although it is possible that the civilisation of Mesopotamia may have extended to a more remote antiquity, yet the earlier examples of coloured architecture are found on the banks of the Nile. The oldest of these decorations have been ascribed to the period of the third dynasty, before the year 3000 B.C. A completely formed style is already shown, which was destined to endure, with very slight alterations, until the Christian era. In this primitive art of the Egyptians the separation between painting and sculpture is not yet clearly defined. At first bas-reliefs with very slight modelling were sunk below the surrounding material, and painted with vivid colours. At subsequent periods colour was applied to the exterior as well as to the interior of buildings, a complete system of polychromatic decoration being employed in the temples of Thebes and Luxor about 1600 B.C. This lasted until the domination of the Ptolemies, as shown in the well-known temples of Philæ, when the arts of Egypt at length began to succumb before the advance of Hellenic culture and Roman conquest.

Through the whole period of Egyptian history, colour decoration shared in the unchanging character of architecture and sculpture. It is, however, possible to trace certain developments from earlier forms, as, for instance, the shape and colouring of the lotus column from primitive coloured bas-reliefs of the sacred lotus

NEW SESSIONS HOUSE: DESIGN BY FRANK T. BAGGALLAY, F.R.I.B.A.

plant, one of many instances of the development of architectural forms from painted decorations. Eventually papyrus, palm, and other floral motives were applied to the decoration of capitals with conspicuous success. The schemes of colouring are usually simple combinations of red, blue, yellow, white, and black. Wall paintings are purely decorative; the human figure was conventionalised no less than flowers, animals, or inanimate objects. Repetition of the human figure as an ornament was thus rendered enduring. The entire neglect of light and shade precluded pictorial effects, though in his own way the Egyptian decorator has contrived to depict wonderfully detailed representations of the religious ceremonies, warlike exploits, and domestic life of his contemporaries.

Great value was obtained by the use of decorative inscriptions, in the form of hieroglyphics, themselves a development of the paintings they explain. The hieroglyphics are often an integral portion of the scheme of decoration, and it is interesting to compare the most ancient known form of art with the similar use of decorative writing by that very modern nation, the Japanese.

Persia.

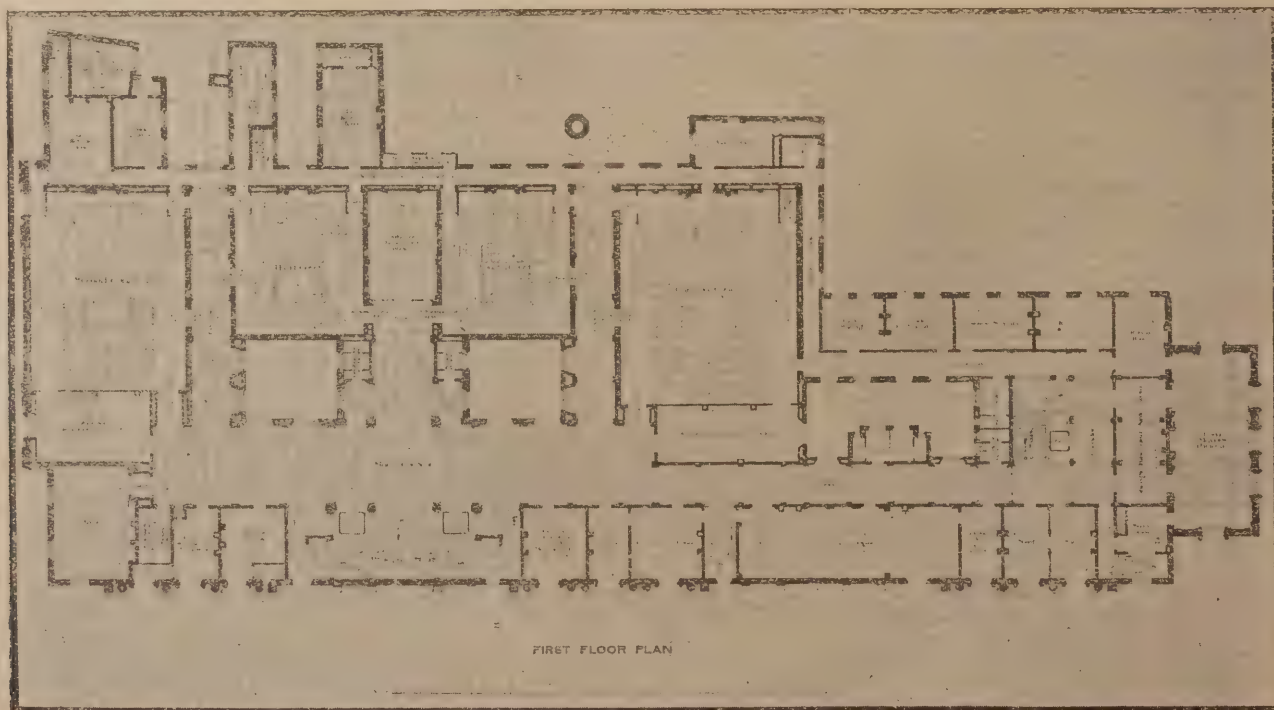

(The use of enamelled brick.)

The buildings of the successive nations that occupied the valleys of the Euphrates and Tigris are now in a far more fragmentary state than those so perfectly preserved by the rainless climate of Egypt. The remains, more particularly of Persian architectural decoration, are, however, of the greatest interest. Good building stone being difficult to procure in the plains of Mesopotamia, important monuments were constructed of sun-dried bricks, strengthened and faced with burnt bricks of a better quality. Interiors may have been plastered and painted, but exterior walls were faced with glazed bricks. These were combined to form representations of real and imaginary animals or human figures, with elaborately patterned borders and friezes.

This method of decoration was employed in the first place by the Assyrians and Babylonians at Nineveh and Babylon, and subsequently, in spite of essential differences in the national style of architecture, by the conquering race of Persians, though with their experience of Babylonian methods the latter

were enabled to produce architectural decorations of greater artistic value.

The most beautiful of these are the friezes and wall decorations from the Palace at Susa of Darius I., who reigned from 521 to 483 B.C. This palace is known to have been destroyed by fire in the reign of Artaxerxes, 465 to 429 B.C. The glazed bricks with which the walls are faced vary in size, averaging 3 in. in depth by 13 in. in length. Each course is kept level and of the same depth throughout. The subjects range from purely ornamental repeating diapers and borders to rows of animals and processions of soldiers, slightly modelled and represented nearly life-size. The grounds of the figures and beasts are always light shades of greenish blues. In the lion frieze the animals are white with green and blue markings and yellow bosses on the legs. Two types of lion are represented alternately, varying in subordinate details. The lions all face the same way, in the same pose, and are completely separated from each other by the light blue ground. Simple borders form the top and bottom of the frieze. The whole composition is in a brilliant key of colour. An even more decorative beast is a dragon, also

FIRST FLOOR PLAN

NEW SESSIONS HOUSE: DESIGN BY FRANK T. BAGGALLAY, F.R.I.B.A.

white, with orange, blue, and green wings, and red horns and markings, on a grey-blue ground—a superb piece of colouring.

The friezes of archers are more subdued and subtle in effect. Here, again, the figures are isolated and alternated. The brown-skinned archers have brown quivers with green patterns, and orange uniform with white and blue spots, all on a green-blue ground. The frieze of white-skinned archers differs only in the details of armour and uniform, the ground colour being slightly lower in tone. The two friezes are thus carefully harmonised with sufficient variety of detail to avoid monotony. The brown faces of the one regiment and the white faces of the other form the keynotes of the two designs; to these the whole scheme of colouring is subordinated with the most consummate skill. (This description is from the plates in Dieulafoy's "Art antique en la Perse," and the casts at Kensington.) In these friezes the Persians, consciously or unconsciously, exemplified the most vital principles of colour decoration. In the first place they deliberately spread a regular diaper of brick joints over the whole decorated surface, thus emphasising both the construction and the material of the wall, and at the same time subordinating the decoration to the architecture. Secondly, their material was sufficiently tractable to permit a correct rendering of dignified figure subjects, while it did not demand a too realistic treatment; thus, on the one hand it was superior to mosaic, on the other it would not seem to compete with the realism of modern painting. Thirdly, they never attempted effects that the material did not readily permit; the figures received the chief care and elaboration (to which the conventional patterns were merely accessory), but never to such an extent as to become mere *tours de force* of technique. Lastly, by gentle surface modelling, and fusing the colours under transparent glazes, they obtained a harmony and softness of effect impossible in flat, juxtaposed tints of oil paint.

Hellas.

(The complete polychromatic treatment of architecture and sculpture.)

Much less is known with certainty about the use of colour by the Greeks than is the case with the work of the Egyptians and the Persians. For although the best period of Hellenic architecture was the comparatively recent date of the fourth century B.C., yet the action of a moister climate on more perishable media has left very slight traces of the original decoration. And there often are so changed that a careful chemical analysis fails to determine the precise nature of the pigments. A certain amount of information can be gathered from the references of contemporaries and the descriptions of travellers. But very various have been the interpretations of such passages, as no impression is more difficult to perpetuate in words than that of colour; and if it has been suggested that Homer himself was colour-blind, from the impossibility of reconciling his epithets with modern ideas, it is not surprising that there is considerable divergence of opinion as to the exact meaning of writers of inferior descriptive powers. As a matter of fact, the direct allusions to colour decoration by contemporary writers of the best period are remarkably few; and while one critic accounts for this by declaring that polychromatic decoration was too common to attract any special notice, others use the same absence of direct evidence to prove that all painted decorations were added to the Hellenic temples at a later period of art.

Again, it is often stated that the Greeks made use of pigments only from secondary motives, to conceal inferior materials and preserve their buildings from decay; as a kind of ceremonial survival from an ancient wooden construction, or as an easier process of decoration than sculpture. Kugler, for instance, wrote: "If no others, yet certainly the white marble buildings erected in Attica exhibited in their principal parts the material of which they were built, in its own proper colour; and that painting, therefore, is only to be referred to subordinate details." Notwithstanding this expression of opinion, the fact seems to be that

the Greeks did employ a complete system of polychromatic decoration on both the interior and exterior of their monumental structures; and that though this was at first from ceremonial reasons, eventually in the best periods of architecture purely æsthetic considerations prevailed.

However, it is not necessary to enter into a critical discussion as to the exact extent to which the Greeks employed colour in architecture and sculpture, a question which depends more on the exact meaning of obscure passages in the classics than on the scanty remains of colour in the buildings themselves. It may be worth noting in passing that a certain anecdote related by Herodotus turns on the fact that in Greece just as heralds were usually dressed in white and temples coloured, so a white temple was as great an anomaly as a herald dressed in colours—the conjunction of the two being an omen of the destruction of the Sicilian town of Siphnos. (Herodotus, iii. 57: 'Ἄλλ' ὅταν ἐν Σίφνῳ πρυτανῆια λευκὰ γένηται, &c.)

Colour decoration had been applied by the Greeks to their sacred edifices from the earliest times. This was considered by Semper ("Der Stil") to be a ceremonial reminiscence, evolved from the prehistoric shrine, sheltered by many-coloured woven fabrics. The prototype of the Doric temple being a wooden building requiring a protective coat of paint, the practice was continued for decorative and religious reasons in the development to a stone or marble structure. The old stone temples of Selinors and elsewhere were covered with a coat of stucco as a ground for painting. Marble was introduced later for constructional reasons, one of its chief advantages being the superiority of its surface for the new method of painting that came into use at the same time. This was the celebrated encaustic process of the Greeks, by which more brilliant results were obtained than by the older distemper process. (Pliny, N. H., xxxv. 39: *Ceris pingere, ac picturam inurere qui primus excogitavit, non constat. Quidam Aristidis inventum putant, postea consummatum a Praxitele. Sed alquanto vetustiores encausticæ picturæ exstiterunt ut Polygnoti, xxxv. 41: resolutis igni ceris penicillo utendi, quæ pictura in navibus, nec sole, ne sale, ventisque corrumpitur.*) Architecture, painting, and sculpture were now combined to form one harmonious whole, a work of art in which one was not more important than the other, sculpture being used to increase the effect of painting as much as painting to increase the effect of sculpture.

Although the polychromatic decoration of the Doric temple was thus of the highest importance, yet it was not governed by the strict laws that controlled the architectural details. The painted decorations were varied to give a special character to the temples of various deities. It is, therefore, difficult to lay down general principles for the treatment of colour, though it is reasonable to assume that the decoration of the Doric order had more in common with Egyptian colouring, the Ionic with that of Assyria. Moreover, any particular "restoration" must always be of a rather hypothetical nature, as the actual pigment has long ago vanished from the exposed portions of stone or marble buildings and only now remains in sheltered places, such as the lacunaria of the Theseion. Still, a fairly reliable clue to the strength and style of colouring is afforded by certain terra-cottas that have been discovered at Olympia and Selinous. In localities where marble was not easily procurable the Hellenic builders used terra-cotta for roofing tiles and gutters, and to case in the corona of the cornice. These terra-cotta mouldings are of a fine yellow-ochre colour and richly ornamented with meanders, guilloches, honeysuckles, and other elaborate patterns in strong reds and blacks. They are described as having kept their colour with extraordinary freshness in a manner impossible with surface decoration. It is evident that, in a well-considered scheme, the whole entablature must have been treated with the same strength of colour and decoration as a single moulding, such as the terra-cotta corona.

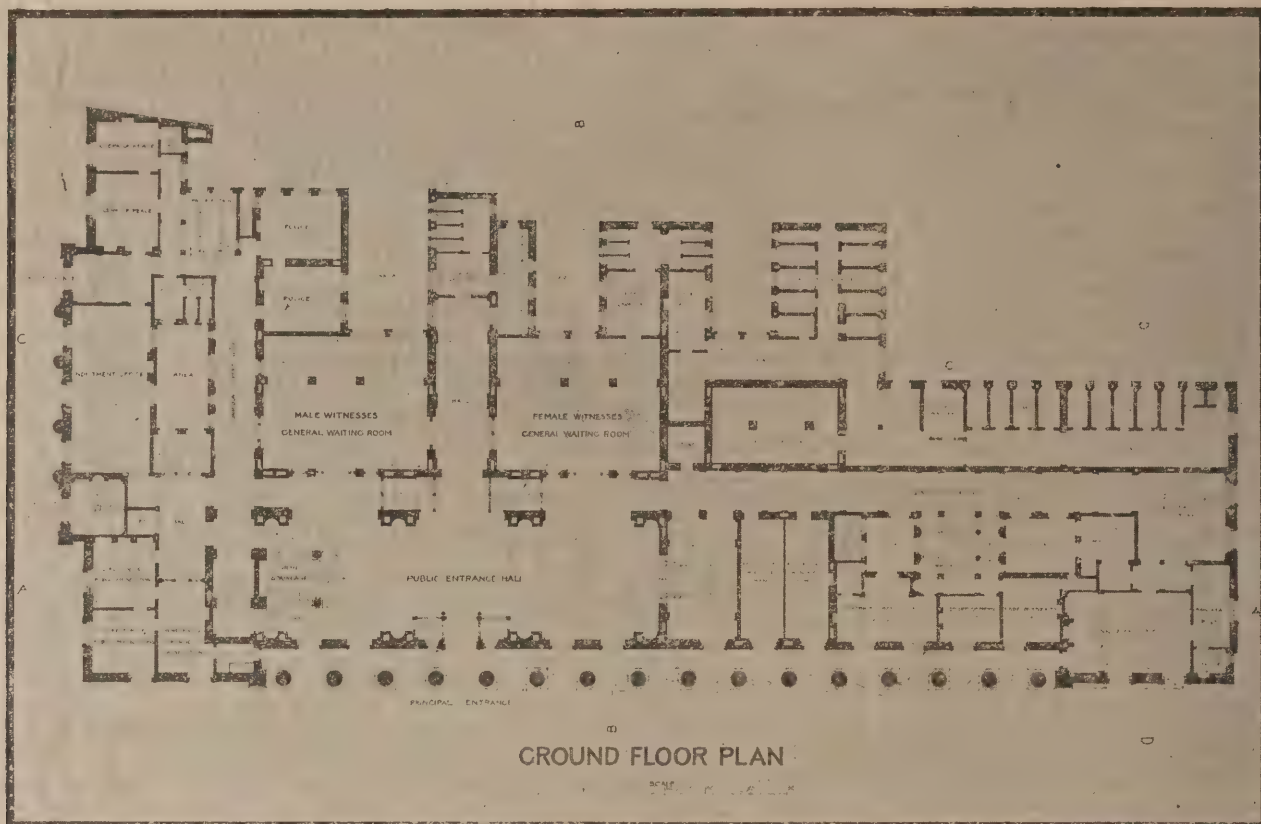

The ideal building is described by Semper

as "glowing with the beauty of the setting sun. The colour a yellow-red, very vapoury, resembling the finest terra-cottas. In fact, the general appearance of the temple would resemble a fine day in the east." This golden-ochre tint or "baphe" (a reminiscence of the older stucco) covered, or rather stained, all portions of the order, the leading features being accentuated by stronger colours. Tympana, lacunaria, and metopes were a deep red, or sometimes a dark blue, as a ground for the sculpture. The prevailing colours of the mouldings were red, blue and green, more brilliant than those used in the grounds. The colours of the ornaments were alternated and "united by delicate fillets of white, black or gold." The enamels of Egypt, Semper suggests, may convey an idea of the colouring of the Attic ornaments. The sculpture was all painted or tinged with colour, the marble never being left in glaring whiteness. Metal ornaments were often attached to the figures, such as the armour and trappings of the Panathenaic frieze; in fact, the sculpture became the predominating point of the composition in colour as well as form, if it is permissible to separate the two elements of effect. Bas-reliefs may have been coloured more realistically than sculpture in high relief, as being more akin to the convention of painting. Flat wall surfaces were decorated with actual paintings. It is probable that, after the Periclean period, the use of colour on architecture and sculpture became less important as the art of painting advanced from the restrained decorative work of Polygnotos to the realism of Zeuxis and Apelles; though the desire for unity, the leading characteristic of Hellenic art and literature, was sufficiently strong to prevent the easel or panel picture from taking a prominent position.

A polychromatic scheme of this description, involving a complete system of coloured sculpture, may be considered impossible. This is a point that requires some discussion, as the value of coloured architecture cannot be separated from coloured sculpture, and a style that declined the assistance of sculpture would be at once deprived of a legitimate and necessary source of architectural effect.

In considering the original state of existing remains of Hellenic art, exaggerated importance must not be ascribed to their present appearance, or to the sensations now produced in us. We have never seen them otherwise than in monochrome, and are accustomed to consider them as perfect now, being incapable of imagining a higher beauty than that we know. Moreover, these marbles, mellowed by the exposure and neglect of centuries, have been endued with a charm of surface texture unknown and undesired by the Greeks, and whatever compensation for the loss of colour is obtained by the action of time must be thoroughly discounted in a just consideration of their perfect state.

Neither must excessive importance be attached to modern failures in coloured sculpture. For these have been unsuccessful from misconceptions of the principles and scope of colour in this connection. Some attempts have failed through too realistic an application of colour, an approximation to nature that would seem to demand speech and motion to complete the deception. The conventions of colour must be observed even more strictly than the conventions of form, while the just limitations of sculpture become all the more necessary when colour is added to the other means of illusion. Other experiments have proved unsuccessful through a too partial use of colour. Subordinate parts have been richly decorated, leaving the head and features in a comparatively neglected state, while in reality the most important points of a statue should be accentuated by colour, as was the practice of the great Hellenic sculptors. Again, statues are now placed in the accidental surroundings of museums or exhibitions. The Greeks beheld theirs under more favourable conditions. The Athene Parthenos was not isolated in an inharmonious interior, but became the central figure in a well-considered scheme of colour. Coloured statuary needs, above everything, a harmonious background; the amount of colour admissible in any par-

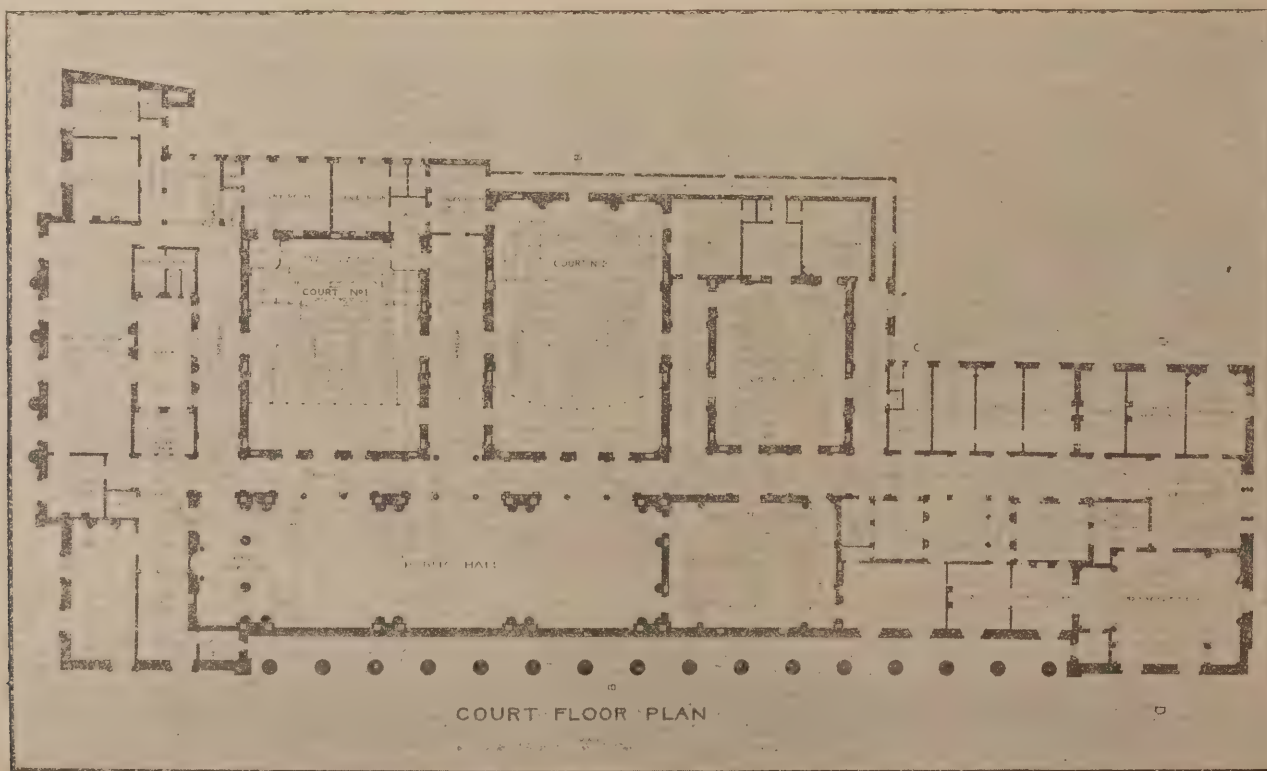

NEW SESSIONS HOUSE: DESIGN BY J. M. BRYDON, F.R.I.B.A.

ticular instance depends entirely on this and the manner of lighting. Colour of a strength pleasing in the case of a large fixed statue suitably balanced by accessories would be intolerable in a small movable figure.

The Hellenic sculptors will be found to have observed some such principles as the foregoing. Small terra-cotta figures were coloured in a modified degree, as was also the case with statues that had no relation to architectural surroundings. Such statues as the great chryselephantine works of Phidias and other celebrated temple idols, though more splendid

with colour, were never treated realistically. It is known, for instance, that the hair of the Venus de Medici was a dull gold, that the Hermes of Praxiteles has remains of red colouring on the hair and drapery, and the eyes of the Athene Parthenos were inlaid with precious stones. It must not be supposed that the great Hellenic artists "painted" their masterpieces of marble in the sense that archaic figures were painted with ceremonial daubs, or as modern waxworks in imitation of nature. Realistic flesh painting was never attempted; the process applied to the nude

parts may be better described as staining with a flat tint, a mere suggestion of flesh colour, without concealment of the texture of the marble. (Pliny N.H. xxxvi. 22. Translucet ergo pictura tenuissimis capillamentis, lenique adhiatu simulacra refovente præter ingenium artificis, ipsa materia, quamvis occulta, in pretio operis intelligitur.) Stronger encaustic colouring may have been laid on the drapery and special features, as eyes, lips, or hair. The marks of metal ornaments on marble statuary are of frequent occurrence, as in the frieze of the Parthenon and the Hermes of Praxiteles.

NEW SESSIONS HOUSE: DESIGN BY J. M. BRYDON, F.R.I.B.A.

Bronze statues do not seem to have been painted, but sufficient play of colour was obtained by the use of various patinas, gilding, precious stones, inlays of silver and coloured enamels.

The statue painter filled a recognised position among Hellenic artists. Several branches of the art are mentioned by Plutarch (Plutarch de Gloria Athen. 6. Ἀγαμέμνων ἐγκραυεῖται καὶ χρυσωτὰ καὶ βαφεῖς), and Pliny relates that Praxiteles himself said that his statues gave him the greatest pleasure when they had been completed by a certain painter, Nicias. If true, this alone would be sufficient proof that the Greeks coloured their sculpture, and *a fortiori* their architecture, from purely æsthetic motives.

Pompeii.

(The decorative use of architectural forms and landscape.)

The Romans were the first nation of antiquity to leave the surface of constructive building materials exposed to view. This abandonment of the use of external decoration becomes the more pronounced when the arch replaces the lintel as the main feature of architectural design. The first important result of this tendency was the frequent adoption and elaboration of the Corinthian order, which lent itself more readily than the Doric or Ionic to variations in the carving and ornaments. The Roman builders were thus enabled to give the temples of different gods an appropriate character as had been previously accomplished in a more refined manner by the polychromatic decoration of the Greeks.

The ruins of Herculæum and Pompeii are the main source of information about the interior decoration of the Romans. And these must be considered as a later development of Hellenic art on a new soil rather than as the direct production of a native school. In the reign of art the statement that Greece had conquered her conquerors remained true. But still these decorations of the country villas of Roman gentlemen, painted about five hundred years after the presidency of Pericles, had probably the same relation to the paintings and decorations of the Athenians that the Louis XV. or Louis XVI. styles have to the works of Raphael and Michael Angelo: though the breadth of treatment, the fine sense of proportion, and the bold use of strong ground colours show that the great principles of Hellenic art were not yet entirely lost.

The Pompeian wall paintings are particularly interesting as examples of two important means of decoration—the use of architectural forms and the use of landscape. Architectural forms, fantastically distorted, were employed with the utmost freedom, either as leading motives or as settings for figure subjects. This style of decoration met with the disapproval of Vitruvius, who seems to imply that the older Hellenic painters had employed architectural features as decorations in more correct proportions. However this may have been, the conventionalised architecture of the Pompeian decorators is far more decorative than the orthodox forms and true perspectives of the Italian painters. The undeniable value of architectural accessories as a means of applying dignity and balance to figure compositions has been recognised in the majority of great schools of painting, a tribute to the all-embracing, all-controlling character of architecture.

The Pompeian landscape decorations comprised many of the subjects used by modern painters, such as gardens, mountains, pastoral scenes, and seascapes, besides heroic exploits and the stories of the gods. These, however, were treated in a decorative manner that has not since been successfully practised in European painting. Attempts at decorative landscape have, however, frequently been made in tapestry, where the beauty of the material has excused the imperfect technique. There seems to be no valid reason why landscape should not again be employed in decorative compositions, provided the feeling of space and light is conveyed to the mind by the association of ideas rather than by the illusion of the eye.

(To be continued.)

Bricks and Mortar.

"It is not sufficient that an artist, when he has completed his work, shall remark, as many do in excuse for its defects, 'it has the exact proportions of the antique and has been copied from good masters,' seeing that a sound judgment and correct eye avail more in all cases than does the mere adjustment with the compass."

VASARI.

An Interesting Discovery.

CONSIDERABLE alterations are at present being effected in the old "Hen and Chickens" Hotel, Bridge Street, Berwick, and while the walls of a front room in the second storey—which are very old—were being stripped they were found to be adorned with quaint paintings representing caryatides, the capitals of Corinthian pillars, with acanthus leaves, and other floral emblems. Above the fireplace is the following inscription, painted in Old English letters:—

"Wyssdome, a science whiche we surely fynd, Shuld not be writ in bookes but in minde."

Steps are to be taken to preserve this interesting and curious relic of the art of a bygone age.

The Tower Guard-house.

THE new guard-house which the War Office has built at the Tower is now almost finished. A portion of the wall of the old guard-house—some of it of immense thickness—which is supposed by many antiquarians to be part of the early Roman "citadel" or "station" that existed hereabouts before the Tower of London was built, has been retained in the lower frontage of the new guard-house, and antiquarian feeling has been further studied by the ingenious retention at the rear of the building of an old Roman well, although it rather interfered with architectural plans. It was 56ft. deep, with a great depth of water, and will be one of the sights of the Tower. At the eastern end of the new guard-house a sundial is to be placed.

Results of Competitions.

THE following premiums have been awarded in the competition for new grammar schools at Bury:—1st (£100), Mr. W. V. Gough, 24 Bridge Street, Bristol; 2nd (£60), Mr. H. Teather, Gateway Chambers, Castle Street, Shrewsbury; 3rd (£30), Messrs. Woodhouse and Willoughby, 100, King Street, Manchester. The estimates ranged between £19,000 and £20,000.—In the competition for new offices for the Mersey Docks and Harbour Board the following premiums have been awarded:—1st (£300), Messrs. Briggs and Wolstenholme and Messrs. F. B. Hobbs and Arnold Thornley, all of Liverpool; 2nd (£200), Messrs. Woolfall and Eccles, 60 Castle Street, Liverpool; 3rd (£100), Mr. J. H. Cook (Messrs. T. Cook & Sons), 12 George's Crescent, Liverpool.

Dante's House.

THERE has been a great deal of excitement and annoyance at Rome recently over the sale, to a private individual, of one of the houses in which Dante lived and wrote, and which has always been called "Dante's House." It is a little villa at Mulazzo, near Geroa, which stands remote and isolated, and belonged to Marquis Franceschino Malaspina, who gave hospitality to the great poet. It stands at the foot of a tower, called the "Poet's Tower," in memory of Dante, and is surrounded by charming scenery. Here Alighieri wrote the first six cantos of the "Inferno," and lived serene and retired from the world which had so despitefully used him. The press is justly indignant at the sale, saying the house should have been bought by the State, or by one of the many Dante Alighieri societies, who lay such stress on their love and veneration for the national poet.

Open-air Theatres.

A WEEK or so back the boys of Bradfield College played the "Agamemnon" of the great Æschylus in their Greek theatre, in celebration of the fiftieth year of the school's

existence. This theatre is the result of an ingenious adaptation by the Warden (Dr. Gray) of a disused chalk-pit. The first idea was to utilise the pit as a swimming-bath, but the Warden, having had the happy idea of building a Greek theatre, designed and erected the auditorium and stage buildings, on the ancient Greek model, in 1890. The stage represents the front of a Greek house, and the auditorium, which is, of course, in the open air, is an amphitheatre made of concrete, seating about two thousand spectators. This example of re-modelling a useless place and making it serve utilitarian ends is one that may well be followed in many other directions, and we must congratulate Dr. Gray for having so successfully utilised such a site as a disused chalk-pit.

Lesser-known Queensland Timbers.

EFFORTS have been made from time to time to direct attention to some of the lesser-known Queensland timbers, several of which are of a choice character, but, in consequence of the want of knowledge on the part of the "timber-getters," are ruthlessly cut down for the commonest purposes. Thus, in the Laidley district, a valuable timber, a so-called rose-wood, of considerable utility, by reason of the beauty of its colouring, for cabinet-making purposes, is largely used for building selectors' homesteads. A kind of forest oak, found at Laidley Creek, is very red, and shows beautiful markings. The common yellow-wood is much used for building purposes, as the white ant will not touch it. It is also used by carriage builders. Among the lesser-known timber-trees is the cockspur thorn (*Cudrania javanensis*), the wood of which is a rich dark yellow colour. It would be much appreciated by cabinet-makers, being of an extremely fine grain, and taking a high polish. Another neglected timber is the common *Elaeodendron australe*, which has a pinkish or flesh-coloured wood, with a close grain, and capable of a high polish. The black brigalow should have a good sale among cabinet and picture-frame makers, as it splits well, takes a fine polish, and when old closely resembles ebony. We are able to publish the foregoing particulars through the courtesy of the London Correspondent of "The North Queensland Herald," 3 Temple Chambers, E.C.

Model Workmen's Dwellings.

PERHAPS the most interesting feature of the Vincennes annexe at the Paris Exhibition, now practically finished, is the little village of workmen's cottages, which illustrate the highest pitch to which the housing of the working classes has arrived in half-a-dozen European countries. Belgium is represented by a neat but somewhat featureless abode in brick, Switzerland by a cottage which has the merit of picturesqueness, Austria by a wooden bungalow used as a hospital for Herr Arthur Krupp's workmen at Berndorf, whose flower-covered verandah and log-built walls suggest a rustic environment. A German paint firm has erected a little cottage, built in white stucco and covered with a red-tiled roof, the six small rooms of which are as clean as mortal *hausfrau* could make them. The German Ministry of War sends a cottage of nearly the same pattern as inhabited by employees of the State Arms Foundry at Spandau. Last, but by no means least, comes the typical English cottage, which Messrs. Lever Brothers, of Port Sunlight, have sent from the banks of the Mersey. The lower storey is of red brick, the upper of the pebble and plaster of which so much exists in the streets of Chester. Red tiles cover the roof, and the interior is a picture of comfort, tasteful and solid. A bath-room is provided, while the decoration of the little parlour, in the opinion of many Continental visitors, deprives the cottage of its claim to be considered a workman's dwelling. To those whose acquaintance is limited to the average abodes of the same class in France and Germany, the criticism is perhaps permissible. A strip of garden, filled with pansies, is planted round the tiny porch, and gives a home-like air to the building. In all, this exhibition is most interesting and instructive.

Views and Reviews.

ACADEMY PICTURES.

There are critics—of the cynical kind—who would say that having once visited the Royal Academy the best thing you can do is to forget it. But, judging from the fact that so many reproductions of the pictures are published every year, there would seem to be a not inconsiderable number of the public who wish to have, in more or less permanent form, a souvenir of the pictures they have seen. For this purpose Messrs. Cassell's "Royal Academy Pictures" are admirably adapted, but we confess to being unable to see any other reasonable use for them. Regarded on its merits as a collection of pictures, this publication is a most depressing one; the sole reason for reproducing many of the pictures is that they happened to be accepted by the Hanging Committee. On no other principle could the compilers have included reproductions of uninteresting portraits of uninteresting people and of landscapes that owe whatever merit they possess entirely to their colouring, which is, of course, lost in reproduction. The publication is not without merit, but it is a mechanical rather than an artistic merit; the illustrations are good examples of half-tone process work, carefully printed on good paper, but as regards five-sixths of them there is no valid reason—except a purely commercial one—why they should have been produced at all.

"Royal Academy Pictures," in five parts; price 1s. each. London: Cassell and Co., Ltd.

WORKING-CLASS HOUSES IN URBAN DISTRICTS.

This book, which takes somewhat the form of an illustrated catalogue of workmen's cottages, appeals more to the speculator and builder than to the architect. It is an attempt, and in many respects a successful one, to improve upon the ill-considered type of plan so often adopted for this class of house, and an endeavour, by the discriminating use of the ordinary materials at command and the elimination of superfluous and oft-times offensive embellishments, to obtain a pleasing exterior not entirely devoid of character.

Several of the model plans proposed show considerable skill, and are quite suitable for their purpose, use being made in many cases of a broken party-wall line. The dwellings treated of are all terrace houses, and an arrangement of which the authors appear to think very highly is suggested for the laying-out of the ground between the backs of adjoining terraces. This peculiarity consists of shortening the back-yards and providing a common open space between them, somewhat in the manner of the London "squares" that are often provided for terrace houses of a much better class. The authors point out that this space would afford not only an excellent playground for children, but would also allow of the collection of dust and the delivery of fuel without passing through the houses, and that a combined drain taken down the centre would obviate the necessity of the house-drains passing under each building to the main road. These advantages would be great and quite worth the decrease in size of the back-yards; but we think the authors have overlooked the difficulty of maintaining this common ground in anything like decent order, and have not considered that the combined drain would be a public sewer repairable by the authorities. Those who, like ourselves, have had experience of the better-class squares will know the difficulty of obtaining funds to keep a common ground in order, a difficulty which in the case of working-class dwellings would appear to be insuperable. Of course, we do not imagine that the authors propose to lay this space out as a garden, but some expense would be necessary to keep the ground clear and in order, or it would become a sort of "no man's land," and the receptacle of all the rubbish of the neighbourhood, whilst in many cases the authorities would object to keep up an additional sewer, the ordinary sewer in the road being still requi-

site. In addition to the description of the various plates, a table of sizes of rooms, cubic contents, cost, &c., is given in convenient form to allow of comparison; and extracts from the Local Government and County Council by-laws are also included. The book is well got up, and should prove of considerable value to owners and builders of working-class property. Its utility is marred, however, by the unfortunate way the respective elevations and plans are arranged on the plates. In hardly any case is an elevation on the same page as the plan to which it refers, and the two frequently do not correspond with each other. This is a point which causes considerable irritation to anyone really studying the book, and one which we shall hope to see altered in a subsequent edition.—J. E. N.

"Houses for the Working Classes in Urban Districts," By Sidney White Cranfield, A.R.I.B.A., and Henry Ingle Potter, A.R.I.B.A. London: B. T. Batsford, 94 High Holborn, W.C. Price 15s.

THE CENTRAL LONDON RAILWAY.

By CHARLES G. HARPER.

OF all the many deep-level electric railways proposed for the needs of London since the opening of that pioneer line, the City and South London in 1891 inaugurated a new era in Metropolitan communications, the Central London, which was opened last week, is at once

THE ROUTE OF THE CENTRAL LONDON RAILWAY.

the simplest, the longest, and the most important. It is a little over six miles in length, its course is almost mathematically straight, and it will serve districts whose necessities have brought into being perhaps the most crowded traffic to be found in the streets of the world. It was the successful construction of the City and South London that led to the formation of the Central London Railway Company; for the making of the first electric railway was largely in the nature of an experiment, both as regards the tractive power and the methods of construction. Electric lines already existed in other countries, but reports as to their efficiency and economy were conflicting, while the system of deep-level tunneling introduced by the late Mr. J. H. Greathead was on its trial. No sooner was it evident that the City and South London was progressing to a successful conclusion than a syndicate of far-seeing people prepared the Central London scheme, which was fought through Parliament in 1891, in the face of a bitter opposition from the Metropolitan and District railways, and from the omnibus companies, whose interest in the route to be followed by the projected railway from Shepherd's Bush to Liverpool Street was direct.

The tunnels of the Central London and other electric railways are practically pipes; they are 11ft. 6in. in diameter, and are lined with iron rings. The method of construction seems simplicity itself, after years of the costly and laborious "cut and cover" principles of underground railway engineering in force until recently. Two tunnels are provided, one for "up," the other for "down" traffic, and the depth at which they lie varies from 65ft. at the Bank to the extreme depth of 98ft. beneath the crest of Notting Hill; these varying depths being chiefly caused by the rise and fall of the roads en route. Occasionally, however, the narrowness of the roadway above, which pre-

cludes the tunnels running side by side, has led to their being placed one above the other.

The construction and equipment of the railway to Liverpool Street was estimated at £3,244,000. The section between the Bank and Liverpool Street has been abandoned for the present, but the cost has actually been, it is said, nearly four millions.

The capital of the company was subscribed in 1895, and amounted to £2,850,000, with powers for borrowing an additional £950,000. With available funds thus amounting to £3,800,000, the work was begun in 1896, being entrusted to a subsidiary company formed largely from interests identical with the Central London—the Electric Traction Company, Limited. The first steps taken were the acquisition and demolition of the house property which covered the sites of twelve of the thirteen stations (the remaining one at the Bank being wholly beneath the roadway), and the purchase of land and houses adjoining Wood Lane, Shepherd's Bush, where the Generating Station and works have since been erected. Shafts were then sunk at six different points along the route, and from them the headings for the tunnels were driven so that the line has been in progress from six places simultaneously. The description of material to be excavated has been London Clay throughout, varied only at a point opposite Stratford Place and in the Holborn Valley by intervening stretches of Water-bearing Greensand. On reaching the required depth, a heading was excavated by pick and shovel in the stubborn London Clay, and the tunnelling device invented by the late Mr. Greathead, and called the "Greathead Shield," was installed at each

of these headings. This invention may succinctly be described as a steel cylinder built up to fit the heading, and 7ft. in depth, the forward edge cut to the fine point of a keen knife, the rear fitted with a number of hydraulic rams which forced the cutting edge into the clay, causing it to fall into the cylinder, in which it was broken up into smaller pieces by navvies, and loaded up in trucks and carted away. The labour-saving on the working of this contrivance is enormous, while the building up and riveting inside the shield of the steel segments forming the lining of the completed tunnel and left behind by the shield in pursuing its slow but irresistible course secures the works against any possibility of subsidence. The daily progress of the shields on their several sections was, on the average, from 12ft. to 14ft. At one period the Central London works had no fewer than thirty shields in operation at once, and made a record of 500yds. of tunnelling completed in one week.

A narrow space left between the clay circumference and the steel lining after the progress of the shield was filled in by a specially-devised "grouting apparatus," which under hydraulic pressure forced liquid cement through the rivet-

holes of the lining, thus securing an absolutely air-tight fitting. The thorough efficacy of this method was seen when, in the course of some alterations involving the removal of a short length of this steel protection, the grouting was seen to have been forced some three or four feet back into the clay. The station tunnels are of greater diameter than that of the other part of the way, measuring 21ft.; while the "cross-over" tunnels made at various points for convenience of access between "up" and "down" tunnels measure 25ft. These were excavated by the aid of larger shields. Only at the two water-logged districts already named was it found necessary to work with the bulkhead fitted to the rearward end of the shield closed, and under compressed air. A somewhat anxious time was that which witnessed the driving of the tunnels beneath Holborn Viaduct, whose numerous piers, imposed directly upon the ground to be traversed, added an element of uncertainty to the work. Those piers and the burden of arches and roadway they carry constitute an enormous weight. No subsidence, however, has been noted here. In addition to the other tunnels, each station has its cross tunnel for passengers, connecting "up" and "down" platforms; but in the case of Notting Hill Gate, Chancery Lane, and the General Post Office stations the platforms are one above the other, owing to the narrowness of the roadway above, and communication is by a continuance of the shaft from booking office to platform.

The Bank station is unlike any of the others, and indeed quite unlike any other station in the world. Here, if anywhere, is the romance of engineering. Situated beneath that broad open space, where the heaviest and most continuous traffic of the greatest and busiest city in the world converges from seven streets, the complicated series of works was executed without ever disturbing or hindering that traffic throughout the two years while those works were in progress. The station consists, first of an approximately circular subway for passengers, 11ft. below the asphalted surface of the roadway, approached by staircases at the end of The Poultry, Walbrook, Princes Street, Threadneedle Street, Cornhill, Lombard Street, and beside the Mansion House. From this subway short flights of stairs conduct to the spacious booking hall, whence lifts give access to the platform, some 50ft. deeper. Below this, again, are the tunnels of the City and South London, running from Lombard Street to Moorgate. The stations of the City and South London in Lombard Street and of the City and Waterloo in Queen Victoria Street are reached by intercommunicating passages, which, like those of the subway first mentioned, are lined with white-glazed tiles and lit by electric light. The public subway was thrown open by an arrangement between the company and the City Corporation. Its roof, and that of the booking hall, supported on myriads of iron pillars and a network of girders, is but a thin sheet of steel troughing laid with asphalt, and all day long and far into the night the sounds of horses' hoofs and of heavy vehicles traversing that asphalt roadway are heard down below, like muffled thunder. Only by working without intermission in day and night shifts was it possible to excavate the earth beneath this open space, to remove patches of the surface, and to replace them with the steel troughing and new asphalt without the slightest hindrance to the traffic; and only by similar methods was it possible to divert the bewildering network of underground pipes, wires, and cables that criss-crossed below the level of the pavements. The highly specialised work of re-organising the gas and water mains, the telephone, telegraph and electric-lighting wires, and the pneumatic despatch tubes, and of bestowing them all in a subway of their own, where they are always easily accessible, without the necessity of breaking up the roadway, was entrusted to Mr. George Talbot, whose foretaste of such labour in the construction of the Glasgow Subway marked him out for the post.

The next most interesting thing on the Central London is the great Generating Station at Shepherd's Bush, occupying 19 acres of ground and containing the finest electric installation in the world. Two great chimneys,

each 200ft. in height, mark the boiler-house, 150ft. long by 85ft. wide, and containing sixteen multitubular boilers, for feeding which a huge water-tank, capable of holding a day's supply, has been sunk outside, in the event of the mains failing. Bunkers have been provided for coal, to hold 900 tons; but economy has been fully considered in fuel by the installation of Green's Economisers, by which the water for the boilers is passed across the hot blast between furnaces and chimney-stacks, entering the boilers already heated almost to boiling-point.

The power house adjoins, and measures 200ft. by 85ft. It houses six Allis engines, made at Milwaukee, of 1,300 h.p. each, in direct connection with three-phase generators, and running six dynamos generating an alternating current of 5,000 volts pressure. This is transformed to a direct current of 500 volts at the four electrical sub-stations at Notting Hill Gate, Marble Arch, Davies Street, and the General Post Office. The carriage sheds and repairing shops are models of up-to-date efficiency. The carriage sheds can house 12 complete trains of seven carriages each, and the repairing sheds have an almost equal capacity. All the machinery is driven by electric current, as will be the lifts at all the stations. At the Bank and Post Office stations there are five lifts, each to accommodate 100 passengers, and travelling at the rate of 200ft. a minute. They have been installed by the Sprague Elevator Company, of New York.

The system of electric traction employed on the Central London is the "third rail," the electric locomotives deriving their motive power from a brush forming the necessary contact. Locomotives and carriages have also been constructed in America. It is proposed to run a service of trains every two and a half minutes, starting at about 5.15 a.m. and closing at half an hour after midnight. The Company estimates an annual traffic of from fifty to sixty millions of passengers; but the actual capacity of the line is some twenty millions greater. The elevations of the various stations have been familiar to Londoners for some time past, and are inoffensive combinations of buff terra-cotta with red-brick externally, and white-glazed tiles within. Staircases lead down to the trains for the use of those who prefer them to lifts. A subway will be made at the Oxford Circus station to communicate with the station of the Baker Street and Waterloo Railway at this point, now under construction.

THE NEW RESERVOIRS AT STAINES.

GREAT progress has been made with the new reservoir works at Staines, and it is expected that they will be complete in a couple of years. The sluice and screening house at the intake, situate about 300yds. above Bell Weir, in Bucks, has been completed during the past year, and the pumping-house at Staines is ready to receive the machinery necessary to pump the water as it runs through the conduit. Altogether, the works cover an area of 421 acres, and the reservoirs will be large enough to add 35,000,000 gals. per day to the existing water supply of London; while, in case of emergency, this quantity may, with the consent of the Local Government Board, be increased to 45,000,000 gals. daily. The land secured is singularly well adapted for reservoirs, the sand and gravel excavated from the interior forming an excellent material for building up the high banks by which they are enclosed. But, to guard against leakage, the contractors are laying down a puddle wall upon the London clay, 6ft. thick at the top and 7ft. thick at the ground level. It is said that this construction will make the reservoirs—the largest yet seen near London—perfectly watertight. The inside slopes are being lined with concrete blocks 5in. thick, for a vertical depth of 15ft., and the average depth of the water will be about 30ft. In the first place, attention is being concentrated upon the two main reservoirs, which will together cover an area of 210 acres, and these, it is anticipated, will be finished in the course of the next twelve months.

New Patents.

The following specifications were published on June 23rd, and are open to opposition until August 7th. The names in italics within parentheses are those of communicators of inventions.

1899.—9,390, HARDY, combined governor and self-lighting gas burner. 10,871, WAHL, method of and apparatus for the manufacture of felt. 11,164, MESSINESI, wood-working machinery or apparatus. 11,181, PREAUBERT, method for the production of coloured wall-hangings. 11,543 SOC. CH. PREVET ET CIE., filtering apparatus. 11,857, JENTZSCH, locks. 11,911, NELSON & NELSON, treatment of sewage, urine, and refuse materials, and the production of fertilisers therefrom by the application of spent oxide. 12,195, SPENCE, air-heating furnaces or stoves. 12,303, ISSELS, apparatus for generating acetylene gas. 12,479, BUTLER, paraffin oil lighting system. 12,950, LANGHANS, manufacture of incandescing media for lighting purposes. 13,145, HUSSON, acetylene generators. 13,280, SMITH, channel rails and current supply for electric tramways. 13,419, MORGAN, method of ventilating sewers. 14,023, TATHAM & COPE, gas burners. 14,848, JACKSON, method of and devices for joining together the ends of driving and similar belts. 15,247, BROADBENT & BROADBENT, machines for breaking stone. 15,388, MORELEY & BARKER, jointing and stopping of pipes or mains. 15,440, VON RECKLINGHAUSEN, VOGT & NERNST ELECTRIC LIGHT, LTD., electric incandescent lamps. 15,521, SUGG, incandescent gas lighting. 15,527, GOUDIE, calculating rules. 15,720, CROMPTON & CO., LTD., HODGSON & TUBBS, electric arc lamps. 16,349, HURST, joint for lead and other piping. 18,870, BOULT (*Jungbluth*), manufacture of electrical insulating material. 19,197, BRIGHTMORE, SWANN & GOODWIN, bacterial treatment of sewage and effluents from sewage works.

1900.—800, HAGUE, means for securing pipes to buildings. 3,749, THAAERUP & DOHLMANN, manufacture of artificial stone. 3,947, CRANE, heating and hot-water supply boilers. 4,740, BOULT (*Roberts*), machines for making fences. 5,193, LEBIODA, apparatus for impregnating wood. 5,279, LAKE (*Dickinson*), ball-cocks. 5,290, GUDE, screw-driving apparatus. 6,706, PAUL, apparatus for heating buildings. 7,165, HAHN & V. RECUM, wood-sawing machines. 7,316, SERRAZANETTI, means for damming torrents. 7,503, MUIR, filling for the interstices existing between paving blocks. 7,534, BROWN, pontoon cranes, derricks, or like structures. 7,595, THOMPSON (*Simonini*), self-lighting gas burners. 7,695, GALSWORTHY, wall plugs for electric lighting and heating. 7,762, JOHN, folding chimney cowl with revolving hood. 7,847, SUGG, supports for mantles for incandescent gas lighting. 7,911, RÜTGERS, solutions or emulsions of tar oil suitable for the impregnation of wood. 7,919, LABOUCHERE, ornamental tiles. 8,128, WISE, carriage for lifting and transmitting timber, &c. 8,140, KEARNEY, fireplaces. 8,143, OLDENDORF, apparatus for producing coloured cement tiles.

The following specifications were published on Saturday last, and are open to opposition until August 13th.

1899.—12,099, SIMPKIN, spike for securing iron work to timber and fastening timbers. 12,395, MARLES & BUTT, carving machines for wood and other mouldings. 13,951, MOSSMAN, cranes. 15,998, BOUSFIELD (*Abbott*), filters. 16,066, SIEMENS BROTHERS & CO., LTD. (*Siemens & Halske Aktien Gesellschaft*), process for purifying water by the joint action of iron and ozone. 16,565, YOUNG & SHAW, raising of water. 19,281, KOOPMAN, manufacture of improved illuminating gas. 21,457, JACKSON, street gas lamps.

1900.—5,632, WHITE, clips for glazing bars. 8,213, BASS & PEAKE, stack pipes.

CARPENTERS' COMPANY EXAMINATION.

THIS annual examination is always preceded by a short course of lectures intended to help candidates and others. The course this year was largely attended, and the number of entries exceeded all previous years with the exception of 1899. The examiners have been careful not to lower the standard required to gain the Company's certificate, but in spite of this the percentage of passes is very good. We are glad to note the highly practical nature of the examination, and to learn that the questions set are plain and straightforward. The Carpenters' Company inaugurated these examinations so long ago as 1888, and ever since the value of their certificates has steadily increased. The gold medal has only been gained three times, so that Mr. F. Hartnoll has obtained a rare distinction this year. Among the names of the examiners we see those of Professor Roger Smith, Mr. John Slater, B.A., Mr. J. Greenwood (president of the Institute of Builders), and Mr. Baster, of the London School Board (Manual Training Department). The following is a list of the successful candidates, arranged in order of merit:—First class: F. Hartnoll (gold medal); J. W. Devonshire and H. Harrington (silver medals); F. C. Brown, W. J. Collins and F. E. Drury (bronze medals); F. Tompkins, H. Colliver, J. Sandham, H. T. Carter, J. T. Maskill, L. H. Bennett and F. Batten (aeq.). D. Grant, H. D. White, E. W. F. Martin, E. Groombridge, S. W. Hayward, H. Hey, H. Elston. Second class: H. Bolton, P. E. Phillips, W. W. Taylor, J. C. Kane, D. W. Thomas, F. B. Self, and T. Stedman and G. E. Taylor (aeq.).

SESSIONS HOUSE DESIGNS.

Nos. 1, 2, 3, AND 5.

WITH last week's issue we published designs Nos. 4 and 6 (respectively of Mr. Mountford and Mr. Belcher) for the new Sessions House in the Old Bailey. This week we are able to give the remaining four designs, and some particulars of each. A criticism will be found on page 395.

Design No. 1, by Mr. H. T. Hare. It was proposed that the whole of the frontages should be faced with Portland stone, except the base, or plinth, which would be of Cornish granite, unpolished. The whole of the cells, with their corridors, witnesses' rooms, lavatories, &c., and the small open area, to be lined with glazed bricks. The construction throughout to be fireproof, the record rooms being rendered specially secure. The whole of the joinery, including the panelling and fittings in the courts, to be of wainscot, except the Lord Mayor's parlour, where it was suggested Spanish mahogany should be used. Corridors to be lined with Devonshire marbles, of which all columns would be made. The upper part of the central hall to be lined with Ancaster stone. Statuary marble to be used for the sculpture. Corridor floorings on the first and second floors to be of marble, and those on ground floor to be of mosaic. Heating by low-pressure steam; courts, cells, and central hall to be ventilated on the "plenum" system. The estimate is as follows:—1,750,000 cubic feet, at 2s. 6d. per cubic foot, £218,750; additional for work and buildings in van-yard, £5,000—total, £223,750.

Design No. 2, by Mr. H. L. Florence. Portland stone from the brown bed to be used for the façades. Columns in the hall to be of solid steel, covered (like the walls) with faience. Corridors to be glazed up to 6ft. and plastered above. Fittings in the courts to be of oak. Heating by low-pressure hot water, the foul air being extracted at ceiling-level into chambers formed over the corridors, and thence conducted through flues in the walls to other flues communicating with the furnace shaft. Fresh air for the cells and courts to be taken from the top of the tower, heated, and forced into the rooms. Estimated cost, £199,164.

Design No. 3, by Mr. J. M. Brydon. Façades of Portland stone, floorings of wood, heating by low-pressure steam on two systems—"plenum" and direct steam heating by radiators. Esti-

mate: 2,256,000 cubic feet, at 2s. per cubic foot, £225,600.

Design No. 5, by Mr. Frank Baggallay. External facings to be of brown Portland stone. Ventilation on the "plenum" system. Estimate: 1,724,000 cubic feet, £215,500.

Putting the estimates together in consecutive order we get:—

Mr. Brydon's design	£ 225,600
Mr. Mountford's design	225,173
Mr. Hare's design	223,750
Mr. Belcher's design	217,000
Mr. Baggallay's design	215,500
Mr. Florence's design	199,164

OLD LONDON BUILDINGS.

An Alarming Collection of Facts.

THE object of the Committee for the Survey of the Memorials of Greater London is to examine certain areas in London, and in them to register whatever may be deemed to be of historic or aesthetic interest. The work is not confined to buildings only; any valuable open space, any remnant of an old village green, any beautiful tree, any object of local life or custom, or interesting piece of handiwork, comes within the committee's survey.

The London County Council had recognised the work of the Committee, and agreed, upon certain conditions, to print such of its records from time to time as went to the making of the body of the register. It was arranged that the work should be done in parishes, beginning in the eastern districts of London, the Committee taking up a western district as soon as possible. The first volume, dealing with the parish of Bromley, will shortly be issued to members. The second deals with the parish of Bow. The third will deal with the parish of Chelsea. The Committee has already started forming its Chelsea collection, and a series of drawings of the houses on Cheyne Walk has been partly made.

A reference to the Bromley volume, said Mr. C. R. Ashbee at the recent meeting of the Committee, would show what might have been done in that parish. The beautiful conformation of the old High Street had been spoiled, its line disregarded, and everything in it sacrificed to the immediate requirements of the moment. Where stood the picturesque seventeenth and eighteenth century houses with their tiled roofs and richly moulded timber cornices and canopies, now stood a grim and melancholy casual ward. Where was the stately house of the Adams' time was now the goods depot of the London and Tilbury Railway. Where stood Tudor House in its garden was now the somewhat conventional open space, with a view of factory chimneys beyond; and where, next it, was the old palace of James I., was now a gaunt uninteresting Board school. The Committee did not wish to imply that a good deal of this was not inevitable, but they pleaded that a good deal was unnecessary and could with proper direction or advice have been prevented.

A Remarkable List.

He read a list, made up from information that had been sent him—by no means claiming that it was complete—of objects threatened or destroyed, in whole or part, in London during the last six years.

Inside the City and County of London these included Stratford Place, the work of Robert Adam, destroyed in part; Haymarket Colonnades, one of the best-planned late Georgian streets in London; Adam Street, Adelphi, one of the finest specimens of Adam's work, almost entirely destroyed; the Rolls Chapel, containing the monument of Dr. Young, the work of Torrigiano, and also the mediæval chancel arch; City churches—the church of St. Michael, Wood Street, of ancient foundation, rebuilt by Wren after the Great Fire, and pulled down in 1897 under the Union of Benefices Act; St. Michael Bassishaw; St. George, Botolph Lane, condemned under the same Act; the old palace of Bromley; Tudor House, Bromley; Alfred Stevens' lions before the British Museum railings; the Embankment Garden of the Chelsea Hospital, in part; the

old Bell Inn, the last galleried inn in London on the Middlesex side of the water; Church Row, Hampstead, in part; the interior of the church of St. Mary Woolnoth; old merchants' houses in the City, Nos. 10 and 11A Austinfriars, and No. 4 Coleman Street; the seventeenth-century houses on the south side of Barnard's Inn; Clement's Inn; Hare Court, Temple, in part; Dick's Coffee House, No. 8 Fleet Street; Ashburnham House, Dover Street, now replaced by flats; Coleherne Court, Earl's Court; Bullingham House, off Church Street, Kensington; the fourteenth-century crypt of Laurence Pountney Hill, let by the Merchant Taylors' Company on building lease and destroyed; the last portion of the Blackfriars Monastery on the north side of Ireland Yard, destroyed this year; Bedford Square, many Adam interiors destroyed; Russell Square, the whole planning of the square spoiled by block buildings, and the façades of many of the houses spoiled; Fitzroy Square, the elevations spoiled and stonework painted over; Hanover Chapel, Regent Street; the Cock Tavern, Fleet Street; Harley House, Marylebone Road, with beautiful timbered garden and some of the finest planes in London; Emanuel Hospital, Westminster; Church Row, Aldgate; Cass's School, Aldgate; the Wardrobe, Stepney, destroyed by the London County Council in widening the thoroughfare; seventeenth-century merchants' houses, Bow; Mitre Square, Aldgate, with the remains of the Priory; Palestine Place, Bethnal Green, a group of eighteenth-century buildings; the Catherine Wheel Inn, Bishopsgate; the eighteenth-century rectory and boundary wall, Bow; Sir Francis Drake's house, No. 35 Basinghall Street; and so on.

This was followed by a list of objects and buildings destroyed outside the City and County, but within the survey; and a further list was read of

Things Threatened during the Last Six Years.

these including Chelsea Hospital; Trinity Hospital, Mile End; St. Mary-le-Strand Church; St. Clement Danes Church; St. Mary's, Stratford-atte-Bow; the Inner Temple Gatehouse, together with 17 Fleet Street, the reputed Chancery of Cornwall, now saved by the action of the City and London County Council; the Jewel Tower, Westminster; the church of St. Ethelburga, Bishopsgate; Lincoln's Inn Fields, the western side, with the Inigo Jones mansions; Christ's Hospital; Sir Joshua Reynolds' house in Leicester Square; Turner House, Chelsea, now saved; Thomas Carlyle's house in Cheyne Row, now saved mainly by the enterprise of Chelsea residents and American subscriptions; Golder's Hill Estate, Hampstead, since saved; Churchyard Bottom Wood, since saved; Latchmere Allotments, Battersea, &c.

Examination showed that the responsibility or blame in these cases rested with such bodies, among others, as the London County Council, the London School Board, the Charity Commissioners, the Elder Brethren of the Trinity House, the Office of Works, and the Bedford Estate. The fact of its being possible to draw up within six years such a list was in itself a very serious indictment against the common-sense and administrative capacity of the citizens of London. He did not suggest that the municipality should buy up every old house, and so forth; but he urged that there should be some means whereby the public should be first consulted when any question arose that affected the history and dignity of London. The proper body to supply this means would seem to be the London County Council, which had obtained the necessary statutory power. A Committee ought to be formed to put itself in touch with all the various social agencies that were seeking to work in the direction of raising the standard of life in the community.

Weights of Large English Bells.

The weight of "Great Paul" at St. Paul's is 16½ tons; "Big Ben" at Westminster 13½ tons; "Great Peter" at York, 12½ tons; "Tom" at Christ Church, Oxford, 7½ tons; and "Tom" at Lincoln, 5½ tons. The oldest bell in England is a bell in the church at Cloughton, Lancs, which dates from 1296.

Property and Land Sales.

On the Oombe Neville Estate.—In the highly-favoured district between Wimbleton, Norbiton, Hampton Court, and Surbiton.—An important area of about 72 acres of valuable Freehold Building Land, immediately adjoining Coombe and New Malden Station on the L. and S.W. Rly., and affording an admirable opportunity for building societies, builders, or dealers in land, with a view either to the creation of ground rents or for sub-division and sale in lots. Messrs.

DEBENHAM, TEWSON, FARMER and BRIDGEWATER

are favoured with instructions from Admiral Adolphus FitzGeorge and Colonel Augustus FitzGeorge, to SELL, at the MART, on TUESDAY, July 17, at two, a most important FREEHOLD BUILDING ESTATE, having an area of about 72 acres, with frontages on the western side to a main road, and on the south side to a new road. All let on short tenancies, so that early possession may be had. The land is in the midst of a favourite and populous neighbourhood, and is undoubtedly quite ripe for building operations. Particulars of Messrs. Farrer and Co., Solicitors, 63 Lincoln's Inn Fields, W.C.; of Messrs. Clutton, Land Agents, 9 Whitehall Place, S.W.; and of the Auctioneers, 80 Cheapside, E.O.

GLEBE LANDS ACT, 1883.—PARISH OF OCKLEY, SURREY.—FREEHOLD BUILDING AND ACCOMMODATION LAND at the Southern entrance of the village, with a long frontage to the main road.

MESSRS. WHITE & SONS, with the sanction of the Board of Agriculture, will SELL by AUCTION at the RED LION HOTEL, Dorking, on THURSDAY, July 5th, 1900, at TWO for THREE o'clock, the principal portion of the Glebe Land of the above parish, consisting of 169 a. 3 r. 9 p., a portion being Eligible Building Sites for the erection of Small Houses, the remainder available either as sites for residences of a good class, as Pleasure Farms, or accommodation land. The property will be divided into nine lots varying from half-an-acre to fifty-five acres in extent.—Particulars, with conditions of sale and plan attached, may be obtained 14 days prior to the day of sale, of Messrs. DOWN, SCOTT & DOWN, Solicitors, Dorking; or of Messrs. WHITE & SONS, Land Agents, Auctioneers, and Valuers, Dorking and Leatherhead.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., 115 Gower Street, W.C. (close to the British Museum).

MODELS. For Exhibitions or Law Cases. Illustrations sent of Work Executed. JOHN B. THORP, 93 Gray's Inn Road, W.C.

R.I.B.A. Society of Architects, Surveyors' Institution, Sanitary Institute, and Civil Service Technical Examinations. Preparation by correspondence, or in Residence.—MIDDLETON and CARMEN, 19 Craven Street, W.C.

FOR SALE.—Unique collection of Forty PYROGRAVEURES by well-known French artist. Any reasonable offer. Principals and Solicitors only.—THIERBAUT, 19 Mornington Crescent, Camden Town, London, N.W.

QUARRY PLANT.

THE proprietors of extensive Granite Quarries are desirous of purchasing the following new or second-hand plant:—

- 5-ton Steam Travelling Crane, Rails, and Sleepers.
- 5-ton Hand Derrick Crane.
- Compressed Air Drills.
- Portable Railway.
- Tip and other Waggons.
- Blacksmith's plant and tools.
- Cableway capable of a 5-ton load.
- General plant.

Full particulars, description, and price, stating where the plant may be inspected, to be addressed to "Granite," care of John Ross, 27 King Street, Liverpool.

STAFFORDSHIRE GOODS, TILES, and SANITARY WARE.—Commission wanted in above for Eastern Counties. Non-Association firm preferred. Seven years' connection.—Address, "Manufacturer's Agent," Box 1413, Office of THE BUILDERS' JOURNAL.

BUSINESSES WANTED & FOR SALE.

The charge for advertisements under this heading is 4s. 6d. for six lines or under, and 9d. per line afterwards, prepaid. Three insertions may be had for the price of two.

TO BUILDERS.—A sound old-established JOBBING BUSINESS in a good residential part in the N.W. district for Disposal, including the long lease of the house, workshops, &c. Purchase price, £700. For particulars apply personally, by appointment, to Messrs. FURBER, PRICE and FURBER, 2 Warwick Court, Gray's Inn, W.C.

ARCHITECT'S PRACTICE for Sale in South-West of England; good opening. For particulars apply by letter, T-SQUARE, Box 1411, BUILDERS' JOURNAL Office.

APPOINTMENTS VACANT.

WANTED, a Young Man to take charge of repairs department in Contractor's business. Must be able to measure and get out estimates and manage men.—Apply, with references as to ability, &c., wages required, and age, to Box 1409, BUILDERS' JOURNAL Office.

MARBLE MASONS Wanted, at once; also first-class Carver for monumental work.—Apply, CHARLES GREENDAY, Monumental Works, opposite entrance to Arno's Vale Cemetery, Bristol.

QUANTITIES, DRAWINGS, PERSPECTIVES.

H. B. JOHN, P.A.S.I.
TUDOR VILLA, TUNBRIDGE WELLS. 3

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

ABLE ASSISTANCE.

WORKING and DETAIL DRAWINGS, DESIGNS, PERSPECTIVES, TRACINGS, QUANTITIES and SPECIFICATIONS. DIFFICULTIES of PRACTICE advised upon. F. BRENT, 7 Stanley Villas, Lyndhurst Road, Wood Green, N. 2

BUILDER'S CLERK seeks situation; aged 24; good experience in Building Trades; salary moderate.—Box 1403, Office of BUILDERS' JOURNAL.

COMPETENT ASSISTANCE rendered to ARCHITECTS, by an A.R.I.B.A., of London experience. Designs worked out from rough sketches, detail and working drawings, tracings, &c.—Address, "Architect," 4 Clarence Road, Moseley, Birmingham. 2

QUANTITY SURVEYORS and ARCHITECTS.—ASSISTANCE RENDERED in Taking-off, &c., by the hour, or on commission. References given.—"H. R. A.," 22 Ellison Road, Streatham, S.W. 2

TO BUILDERS, DECORATORS, &c.—Evening assistance by competent man, specifications, plans, estimates, sanitary or dilapidation surveys, accounts or books.—"M.," 10 Dawes Road, S.W.

SEASONABLE PUBLICATIONS

FOR

Builders, Decorators, &c.

With numerous Illustrations and Plates (Four in Colours), 12s. 6d.

PAINTING & DECORATING:

A Complete Practical Manual for House Painters and Decorators. Embracing the Use of Materials, Tools, and Appliances; the Practical Processes involved; and the General Principles of Decoration, Colour, and Ornament.

By **WALTER JOHN PEARCE**,

Lecturer at the Manchester Technical School for House Painting and Decorating.

"Confidently recommended alike to the student and to the workman, as well as to those carrying on business as house painters and decorators."

The Plumber & Decorator.

PAINTERS' COLOURS, OILS, AND VARNISHES.

A Practical Manual. By **GEORGE H. HURST**, F.C.S., Member of the Society of Chemical Industry. With valuable recipes and numerous illustrations. 12s. 6d.

"The only English work that satisfactorily treats of the Manufacture of Oils, Colours, and Pigments."

"BUILDERS' JOURNAL" INSURANCE POLICY.

FREE INSURANCE. £100

Will be paid to the legal representative of any man or woman (railway servants on duty excepted) who shall happen to meet with his or her death by an accident to the railway train in which he or she was travelling in any part of the United Kingdom on the following conditions:—

1. That at the time of the accident the passenger in question had this paper in his or her possession.
2. That prior to the accident the passenger in question had affixed his or her usual signature in the space provided below.
3. That notice of the accident be given to the Corporation guaranteeing this insurance within seven days of its occurrence.
4. That death result within one month from the date of the accident.
5. That no person can claim in respect of more than one of these coupons.
6. The insurance will hold good from 6 a.m. of the morning of publication to 6 a.m. on the day of the following publication.

PAYMENTS TO QUANTITY SURVEYORS.

AN IMPORTANT CASE.

THE case of *Mellor v. Britton* was heard before Mr. Justice Bigham in the Queen's Bench Division of the High Court of Justice on June 26th. It was an action by a quantity surveyor against a builder to recover £411 for preparing quantities. A Mr. Sanderson had entered into a building agreement with the freeholder of certain land at Chelsea to erect flats, to be called Burton Court, which when completed were to be leased to Sanderson. He employed the plaintiff to prepare plans and to take out quantities on which builders were invited to tender. The defendant was amongst the builders who tendered. His tender, amounting to £28,000, was accepted by the building owner. The defendant in the usual way included in his tender the amount of the plaintiff's charges, and in the ordinary course the plaintiff would have been paid by the defendant out of the first instalment of the contract price received by the defendant from the building owner, but when the first instalment became due it was not paid, and the defendant thereupon entered into an arrangement with Sanderson by which the defendant took over the latter's agreement with the freeholder, and released him from all claims, present and future, under his contract; but Sanderson was given an option to purchase the building when completed on paying the defendant the contract price and interest. Up to the present time the building had not been completed, and in these circumstances the defendant denied his liability to pay the plaintiff the amount of his charges.

Mr. Bailhache, for the plaintiff, said that the custom of the trade that the quantity surveyor should be paid by the builder out of the first instalment of the contract price, although the contract of employment in the first instance was with the building owner, had been judicially recognised (see *North v. Bassett*, 1892, 1 Q.B., 333). Here the defendant had not been paid in money by the building owner, but he had received an equivalent in kind, having taken over the whole adventure and given the building owner an absolute release.

Mr. W. H. Stevenson, for the defendant, contended that his client was not liable. The case was like *Campbell v. Blyton* (Hudson's "Building Contracts," vol. 2, p. 105), where the building owner had given a mortgage to the builder, and Mr. Justice Wills there held that the builder was not liable to the quantity surveyor. The undertaking of the defendant was to pay out of a particular fund—namely, the first instalment—and that fund had not as yet come into existence.

Mr. Justice Bigham, in giving judgment, said that the plaintiff was entitled to judgment. In the first instance the plaintiff could call upon the building owner to pay his charges, but as soon as the latter had entered into a contract with a builder and had put him in a position to pay by providing him with money, the building owner's liability to the plaintiff came to an end. Then what were the contractual relations between the plaintiff and the defendant? The defendant had undertaken to pay him as soon as he himself received his first instalment from the building owner. That placed on the defendant the obligation to get the first instalment. He was not bound to try and get blood out of a stone, and if he could not get payment from the building owner he was under no liability to the plaintiff; but if he could get the money or an equivalent he was liable. A difficulty arose in this case about the payment of the first instalment, but it was not an insurmountable difficulty, for having regard to the amount of work which had been done the building owner might have raised the money. If proper steps had been taken the building owner would have been able to pay. What happened was that the defendant for reasons of his own took from the building owner an out-and-out assignment of the agreement with the freeholder in full satisfaction of all the defendant's claims under his contract. The position was, therefore, that the defendant

had chosen to accept, instead of cash, the assignment of the building agreement, carrying with it the benefit of all the work done up to that point (which far exceeded the plaintiff's claim) and also the possibility of future benefits. If the builder chose to vary his relations with the building owner he might do so, but not so as to prejudicially affect the claim of a third party who had nothing to do with the arrangement. There would be judgment for the amount claimed with costs.

A stay of execution was applied for and refused.

RELATIVE COSTS OF WATER WASTE AND ITS DETECTION.*

By A. J. JENKINS, Assoc.M.Inst.C.E.

THE waste of water is a subject that is almost daily before every member of this association, and its growing importance has been recognised by water engineers for many years. The establishment of the now almost universal system of constant supplies, so far at least as this country is concerned, is largely due to the means adopted for the detection and prevention of waste. The usual methods of detection adopted are very generally understood, and the results arrived at are easily obtainable, but the actual cost of the operations is seldom given.

In order to avoid repetition as much as possible, it is proposed to give a description of the Cardiff system of detection and prevention of waste, with particular reference to the cost and the value of the results obtained, comparing them with the few figures available of results obtained in other towns.

It can be shown that the cost of an efficient system of detection and prevention of waste is amply repaid by the value of water saved, and when it is considered that the average pressure throughout the town of Cardiff is but 34lbs. per sq. in. it may safely be inferred that where pressures are higher greater saving may be expected, because, other things being equal, a greater pressure must result in greater waste. At the outset it may be well to review briefly the extent to which waste may go on, and to show to what extent it has been reduced.

As early as 1859 the Norwich Waterworks Company obtained an Act of Parliament to enable them to prescribe in detail the nature of all fittings and pipes and the work connected with them, and to interdict the use of existing fittings and pipes which, in their judgment, might tend to waste, with the result that within a few years the consumption of water was reduced from 40gals. per head per day (intermittent supply) to 15gals. (constant service). In the following year (1860) the Manchester Corporation obtained similar powers, and quickly reduced the domestic consumption under constant supply from 35gals. per head per day to 14gals. The system of inspection and supervision of fittings employed at Norwich and Manchester proved abortive in Liverpool, and in 1874 Mr. Deacon introduced the waste-water meter system with immediate beneficial results, the domestic consumption being reduced by about 6gals. per head per day, and the intermittent supply (averaging 12½ hours per day) converted into a constant supply.

The daily consumption of water in Cardiff for all purposes averages about 20gals. per head per day in winter, and has run up as high as 28gals. in the hottest days of summer; 25.5gals. being regarded as the average hot-weather consumption. Of this the quantity registered by meter, almost wholly for trade purposes, is between 7gals. and 8gals. per head per day.

It may be well to note that Cardiff is entirely a water-closet town, 15,400 closets being supplied directly through cisterns; there are also 10,200 baths directly connected, no additional charge being made for either. The system of inspection to be described costs £500 per annum for a population estimated at about 200,000, but this does not include the

cost of any repairs, except the gratuitous renewal of tap-washers.

Cost of Water.

The cost of water to the Cardiff Corporation is at the present time about 7.5d. per 1,000gals.; but the works are capable of giving a larger supply if increased filtration area is provided, and it is probable that the cost will ultimately be reduced to 6d. per 1,000gals. The average for the eight London water companies is 7.1d. per 1,000gals. In comparing the cost of water saved with the cost of detection and prevention of waste, 6d. per 1,000gals. is adopted by the author as being a fair average, and within the mark as regards Cardiff.

The staff of waste inspectors employed within the borough numbers six, the whole being under the direction of the chief inspector; two outside districts are looked after by their district inspectors, who act also as turncocks and meter inspectors in those districts, with occasional help from the town staff. The borough is divided into six districts, and each is periodically examined by means of a house-to-house inspection, when every fitting is examined and every service sounded for hidden leakage. The number of houses within the borough is about 29,700.

In the meter-controlled districts a test is made once in six months. If the waste-line shows a loss of less than 2gals. per head per day in a district made up of cottage property, or 3gals. per head per day in a district of villa property, the district is considered to be in a satisfactory condition; it is found, however, that one test in two (average) indicates a loss greater than the above, and a house-to-house inspection is proceeded with, but under no conditions is a district allowed to go for more than two years without such an inspection, the increased revenues resulting from the discovery of chargeable items being about £50 per annum.

Referring to the leaks discovered as the result of waste inspection, and calculating the probable amount of leakage on the figures ascertained from the meter-controlled districts, we get a daily waste of more than 544,000gals., or one-tenth of the total supply of the district, detected and remedied at an annual cost to the Corporation of £500. This quantity is sufficient for the supply of 20,000 persons, and the value of it is £4,964 per annum.

The Use of Stop-Taps.

Since the year 1890 the Corporation have introduced outside stop-taps. All new services have been provided with them, and the existing services are being fitted as opportunity occurs. In all, about 2,400 are fixed annually, so that at the present time of the total of 29,700 premises within the borough about 24,000 are provided with these useful fittings. As the town is at present overbuilt, the number of removals and empty houses is large. The advantage of the outside stop-taps for temporarily shutting off the supply from these houses as a preventive of waste will be appreciated from the fact that no less than 1,628 were closed last year in consequence of removals, non-payment of rates, and temporary closing of houses during absence from home of the occupiers. The advantage of shutting off each house for repairs rather than shutting off the supply of the street is considerable, and does away with what used to be a great inconvenience to the consumers.

The cost of providing and fixing a ½in. stop-tap of first-class make, with guard and cover complete, is 11s. 6d. on an old service and 7s. 6d. on a new.

The stethoscope used in Cardiff is one of straight-grained ash, 24in. long for inside work (house inspection), and 36in. for street work, conveniently shaped at the top to place against the ear. The results obtained are excellent, and the inspectors have, by sounding along the ground and without direct contact with the pipes, located leakages so small as to be almost invisible when uncovered. Metallic stethoscopes are found to be too sensitive, as they lead to confusion of sounds.

The Sources and Extent of Waste.

Waste may be classified under three heads: (1) that due to overdrawings and leaving taps running after use; (2) defects in mains and

* Summary of a paper read before the meeting of British Association of Waterworks Engineers, held at Cardiff on June 26th, 1900.

GROUND FLOOR PLAN.

NEW SESSIONS HOUSE: DESIGN BY H. L. FLORENCE, F.R.I.B.A.

service pipes; (3) inferior taps of all kinds and siphon cisterns. For the first of these there appears to be no remedy; self-closing taps cannot be regarded as a satisfactory cure.

Defects in mains and services are a great source of waste, though in point of number they amount to less than one-fifth of the total number of leakages, and, being for the most part hidden from sight, they may be expected to remain longer undiscovered.

It may be noted that the increased use of wood paving or asphalt for roadways, with their underlying bed of impervious concrete, tends to prevent leakages showing at the road surface to a very marked extent.

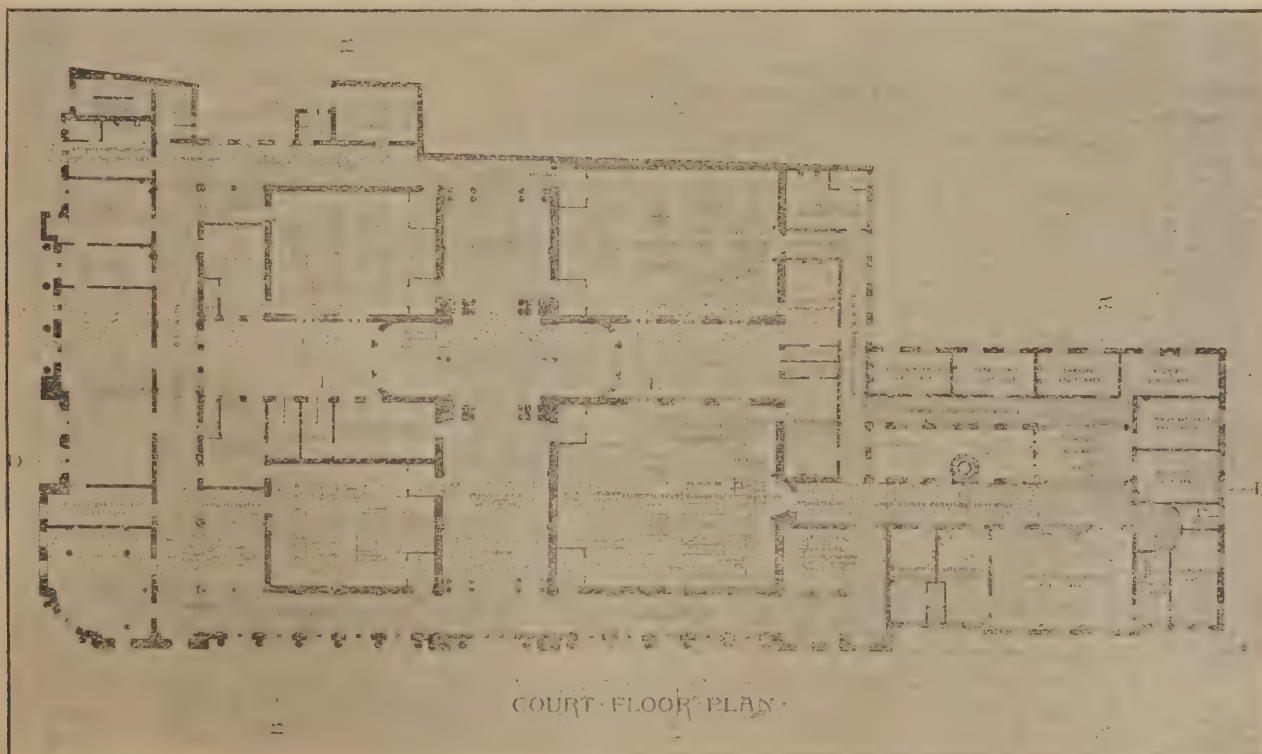

Inferior fittings are probably the most fruitful

source of waste. The system of control in this respect exercised by the Cardiff Corporation only partially mitigates the evil. No system of testing and stamping each fitting has yet been introduced, though it has been under consideration; but all fittings and siphon cisterns must be those of approved makers who have previously deposited sample fittings with the Corporation. It is the duty of a turncock to examine the fittings on a new service before the water is turned on to see that they are by an approved maker and that they are equal to the deposited approved sample, but this examination is necessarily very superficial, and therefore unsatisfactory.

The requirements of the Corporation with

regard to bib or stop taps are that they shall not be less than the following weights:—1in. diameter, 32oz.; $\frac{3}{4}$ in., 21oz.; $\frac{1}{2}$ in., 12oz.; $\frac{3}{8}$ in., 8oz.; double-valve bib-taps— $\frac{3}{4}$ in. diameter, 24oz.; $\frac{1}{2}$ in., 14oz.; $\frac{3}{8}$ in., 10oz.; and they shall be capable of resisting a pressure of 250lbs. to the square inch.

Experience indicates that if the following small points were more carefully observed by makers the number of leaking taps would be immensely reduced. The first is that the thread on the spindle is frequently too short, so that when the washer wears down there is not sufficient thread to allow the valve to be screwed down on its seat; secondly, the seating is generally faced too wide, whereas it is

COURT FLOOR PLAN.

NEW SESSIONS HOUSE: DESIGN BY H. L. FLORENCE, F.R.I.B.A.

preferable that the seating should be narrow and slightly raised, so that it may wear a groove into the washer, and thus secure a tight joint when the valve is screwed down without requiring the exertion of too much strain.

The requirements as regards siphon cisterns are more satisfactory, but as a sample cistern only is examined at the waterworks depot there is no control beyond that of superficial examination when the cistern has been fixed. It has been the practice for many years to renew the washers of all leaky drawing-taps free of cost to the consumers, with the result that on the average 11,000 have been repaired annually at a cost not exceeding 2d. per tap. That this has proved economical there can be no doubt, because the time lost in compelling the property owner to get the tap repaired and in seeing that it is done would be far more costly of itself, apart from the amount of water that would be wasted in the meantime.

Conclusion.

The necessity for the husbanding of supplies must become more pressing every year; the requirements of sanitation naturally lead to an increased domestic consumption, the requirements of trade are upon the increase, and the growth of populations in the larger towns is progressing at an enormous rate; it is true there are still large areas of gathering grounds unappropriated, but for the most part they are at great distances from large towns; each year the cost of works is increasing, and if economies can be made in existing supplies and the increased demands be partially, if not wholly, met by the prevention of waste, then it behoves water authorities to make those economies. This point is specially referred to, as a matter of great importance, in the final report of the last Royal Commission on the London Water Supply. Attention is drawn to the fact that the Grand Junction Company supplied 44, 48, and 48 gals. per head per day as compared with 29, 31, and 29 gals. per head supplied in the same years by the Kent Company. The explanation given by the engineer of the Grand Junction Company was that they found it cheaper to pump water to waste than to prevent waste; this does not appear to be the experience of the majority of the London water companies, who have lately prosecuted very vigorously the inspection for the detection of waste, and have applied "Deacon" waste-water meters to parts of their district.

To summarise the matters dealt with in this paper, the author submits the following conclusions: (1) That to keep the supply of a district within reasonable bounds an efficient system of inspection is necessary. (2) That a regular and systematic inspection can be carried out at a very reasonable cost, which will certainly be repaid in the value of the water saved. (3) That the prevention of waste will be facilitated by the introduction of a system of testing and stamping of all fittings. (4) That within certain limits the expenditure incurred by the execution of "free repairs" is warranted by the saving of water resulting.

SANITARY CONDITION OF FURNISHED HOUSES.

THE case of *Harman v. Simpson*, which was heard recently before Mr. Vevey, Official Referee, in the High Court, raised important points regarding the standard of sanitary condition covered by the implied warranty given by the landlords when letting furnished houses. The defendant agreed to take a furnished house, 33 Pandora Road, Hampstead, from the plaintiff for twelve months, but on being advised by his sanitary surveyor that the house was unsafe as a place of residence he declined to take it. The sanitary inspector of the Hampstead Vestry was called for the plaintiff. He gave it as his opinion that the sanitary arrangements of the house were satisfactory, and equal to 99 out of every 100 houses in Hampstead. The following facts were admitted by witnesses on both sides:—w.c. on bedroom floor not against an external wall; this w.c. had an earthenware trap with putty joint at connection with soil pipe; the soil

pipe was of light iron rainwater piping, rusty, and with putty joints, also in the centre of the house throughout its whole course; there was no disconnecting trap with air-inlet between the sewer and the house, and the only ventilator to the drain was the iron soil pipe already mentioned. In cross-examination the Vestry Inspector admitted that in consequence of a complaint made in January he tested the soil pipe and found a defect which he saw made good; that in February a further complaint was made, and on again testing the soil pipe he found two new defects; these he saw made good. In May Mr. Simpson agreed to take the house furnished, but before entering into occupation had a sanitary survey made, the result being that the house was condemned, and on behalf of the defence it was said that a w.c. and soil pipe as described were dangerous to health, and it was urged that the evidence of the Vestry Inspector proved that a thin iron soil pipe with putty joints could not be relied upon even from month to month, defects not existing in January having been discovered in February. This view, however, did not commend itself to the Official Referee, and judgment was given for plaintiff for £70 damages.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Proportions of Rooms.

AYR.—J. W. writes: "What should be the length, width, and height of a dining-room containing, say, 260 superficial feet of floorage, to be considered in good proportion? Kindly give also the sizes of a drawing-room in the same way."

There can be no definite rules laid down as to any exact proportions either for a dining-room or a drawing-room. The latter, if not intended for large receptions, may often with advantage be made of irregular shape and proportions. In the dining-room there are certain practical points which to some extent dictate the proportions. Thus, in a small room it is more convenient for serving if the plan is nearer the square, whereas for a large dining table the plan may with advantage approach the double square, provided sufficient height can be given to the room. The largest room on any floor often fixes the height of all the rest, and Chambers recognises the impossibility on this account of employing the best proportions in the smaller rooms. The following suggestions are taken from Gwilt:—For square plan and flat ceiling, height to be not less than $\frac{2}{3}$ the side, nor more than $\frac{3}{4}$; for longer proportions the height may equal the width; where a cove is employed the proportions should be increased. One of Palladio's rules for long rooms (as opposed to square) was to add length to width and take $\frac{1}{3}$ the sum as height. The appearance of a room having too great a height may be improved by a predominance of horizontal lines in its decoration, and vice versa.

A. G. B.

Architectural Sketching in the Vicinity of Leeds.

STUDENT writes: "Kindly give me full particulars as to situation of Kirby Hall, best mode of visiting it from Leeds, and name of present tenant. Also give a list of buildings near Leeds that are worth sketching and measuring."

A Leeds architect favours us with the following reply:—"Your correspondent does not say which Kirby Hall he wishes to sketch—Kirby Hall, Northants, or Kirby Hall in Yorkshire. The latter is, as far as I can gather, about fourteen miles from Ripon, and is rather a good Late Renaissance mansion. 'Student' will find plenty of subjects to sketch and measure near Leeds. He couldn't do better than measure up

one of the fine, simple Yorkshire granges, such as Swinsty Hall, Fewston; Riddlesden Hall, Keighley; Oakwell Hall, Birstall; Lumb Hall, Driglington; and numerous smaller, but very interesting, homesteads. If he wishes to sketch ecclesiastical work there is Kirkstall Abbey, Adel Church, Methling Church (some very fine tombs here), and Henewood Church. Selby Abbey and Bolton Abbey are also within easy reach."

A Question of Signboards.

EPFING.—Constant Reader writes:—"Is it technically correct to state on a signboard the original date of the establishment of a business of which the present owner has only had a few years' possession?"

In our opinion it is correct. If John Brown founds a business in 1850 and John Thomas buys it from him in 1900, John Thomas has every right to state that the business was founded in 1850, for in purchasing it from John Brown he acquired all the benefits belonging to that gentleman in respect to the business.

Book on Building Construction and Sanitation for Beginners.

DUBLIN.—DUBLIN FUSILLIER writes: "Kindly name a book on building construction for a beginner to study; also one on sanitary work."

"Rivington's Building Construction," four volumes—vols. i. and ii. 8s. each; vol. iii. 16s.; vol. iv. 11s. 6d. "Building Construction and Drawing," first stage or elementary course, by Charles F. Mitchell, price 2s. 6d. "The Plumber and Sanitary Houses" (6th edition), by S. Stevens Hellyer, price 10s. 6d.

Architectural Sketching in Norfolk.

BATHER writes: "Kindly give me the names of some towns in Norfolk where there are good subjects for making architectural sketches."

There are opportunities for good sketching anywhere around the Norfolk coast from Lynn to Yarmouth; either of these places would give "Bather" plenty of work. It all depends on the kind of work he wants; there are numerous churches, a quantity of domestic work, with halls, manor houses, &c.; but of course your correspondent would have to travel about by train, bicycle, or walking trips for these objects of interest. Cromer, Sheringham, Mundesley, Cley, or Hunstanton would probably provide a more congenial holiday centre: the country and architectural objects around all of these places are equally good.

GEORGE W. SKIPPER, F.R.I.B.A., and F. W. SKIPPER, Norwich.

Strength of Beams.

HOLLOWAY, N.—ENIROL writes: "What is the safe distributed load for a fir-beam, 12in. deep, 9in. wide, and 13ft. long, of uniform cross section, supported at both ends and by a storey-post placed under its centre? Is it approximately correct to treat each half as a beam fixed at one end and supported at the other?"

Calculate the strength in the following manner: A beam of uniform section, uniformly

HALF BEAM
DETERMINING STRENGTH OF BEAM.

loaded, supported at both ends and resting on a storey-post in the middle, is under the conditions of a continuous beam over two spans. Continuous beams are calculated by the "Theorem of Three Moments" (Adams's "Handbook for Mechanical Engineers," p. 77; also Rankine and Molesworth), but it is perhaps sufficient to note that provided the supports are perfectly level the

effective load will be three-sixteenths of the total at each end and five-eighths of the total on the storey-post in centre, instead of one-fourth at the ends and one-half in the centre, as would have been expected. The distribution on the supports will, however, vary when the level is altered, viz., increasing in the centre when the centre is raised and *vice versa*. From the reaction on the supports the bending moment at any point can be calculated the same as with an ordinary beam similarly loaded. If the case proposed each half of the beam will be virtually the same as a beam supported at one end and fixed at the other. The bending moment at x measured from either abutment will be

$$Mx = \frac{wx}{2}(l-x) - \frac{wlx}{8}$$

l = span of one bay (centre to centre of bearing surfaces)

w = distributed load per unit of length.

The bending moment at centre over storey-post $M_B = -\frac{wl^2}{8}$. The point of contrary flexure f is such that $Af = 0.7336$. The bending moment midway between A and $f = M = \frac{9wl^2}{128}$

which is thus seen to be less than the bending moment over the storey-post.

By diagram ACB is a parabola whose ordinate at centre $CD = \frac{wl^2}{8}$, and BE is the same height. The shaded portions show the bending moments. We must now equate the bending moment to the moment of resistance in order to find what the beam will carry.

The greatest bending moment $= \frac{wl^2}{8}$, and the moment of resistance of a rectangular beam $= \frac{Cb\bar{d}^2}{6}$, where C = constant for fir = 6600 (ultimate stress lb. per sq. in.), b = breadth in inches, \bar{d} = depth in inches. Factor of safety, say 6.

Then $\frac{wl^2}{8} = \frac{Cb\bar{d}^2}{6}$
whence $w = \frac{8Cb\bar{d}^2}{6l^2} = \frac{8 \times 6600 \times 9 \times 12^2}{6 \times (7 \times 12)^2} = 1616$
and $\frac{1616}{8} = 202$ lb. per ft. run safe load.

$$\text{Total load over 13 ft.} = \frac{202 \times 13}{112} = 23.4 \text{ cwts.}$$

HENRY ADAMS.

"Petrifite."

MANCHESTER.—J. W. C. writes: "Can you give me the name of the firm or company who manufacture 'Petrifite'? It is a white powder used for solidifying without mechanism almost any material that can be named."

The Petrifite Company's office is at 24 Finsbury Square, London, E.C., and their works are at Orchard Yard, Blackwall, London, E.

Method of Working Mastic.

RISHTON.—J. H. A. writes: "What are the proportionate parts of masticot, commonly known as mastic, for pointing the outside of a chemical chimney?"

Mastic is known by various names, but with the exception of mastic cement the materials and proportions of each are nearly alike. London mastic consists of 100 parts of ground stone, 50 parts of fine river sand, and 15 parts of litharge: these are all dried and mixed and passed through a fine sieve. When required for use it is mixed with raw and boiled linseed oil (in equal proportions) until of the consistency of fine mortar. It requires long and frequent working and beating; in fact the more it is knocked up the better it works. The addition of 15 parts of red lead is sometimes used to increase the tenacity of the mastic. Old mastic is composed of fine sand, pulverised stone, pottery, scharff, glass, flint, to which are added different oxides of lead, as grey oxide, litharge, the whole being intimately incorporated with linseed oil. The proportions are as follows:—To any given weight of sand or pulverised pottery were add two-thirds of the weight of pulverised stone. Then to every 500lb. of this mixture add 40lb. of litharge, 2lb. of pulverised glass or flint, 1lb. of minium, and

2lb. of grey oxide of lead. The whole must be thoroughly mixed together. To every 30lb. of the dry mastic add 1 quart of linseed oil, and thoroughly incorporate the whole mass together, either by treading or with a trowel. Walls or other surfaces to be plastered or pointed with these mastics should be first brushed with linseed oil. All mortar joints should be well raked out and the surface swept with a coarse broom before the oil is applied. Mastic cement consists of 60 parts of slaked lime, 35 parts of fine sand, 3 parts of litharge, and from 7 to 10 parts of linseed oil. The whole mass must be well mixed and beaten until thoroughly plastic. This mastic cement is impervious to damp, and is not affected by atmospheric changes. Mastic if well made, manipulated, and properly laid is waterproof, heat-resisting, and adheres to stone, brick, metal, and glass with great tenacity.

W. MILLAR.

Building Information about Exeter.

SEAFORTH.—BLACK AND WHITE writes: "(1) Kindly name the different classes of building stones in Exeter, prices per cubic foot, colour, nearest quarry. (2) What is the nature of the soil in the neighbourhood of Exeter? (3) What is the price of bricks per thousand around Exeter? (4) Which is the best book on estimating?"

(1) There is no quarry in Exeter; the nearest is Pocombe. The stone is of a red colour, and is not used for tracery. Prices vary much, according to selection. It is a Trap rock. (2) The soil in the neighbourhood of Exeter is generally light loam. Substrata are varied: gravel, marl, shale, red sandstone. (3) 27s. 6d. (4) "Estimating," by George Stephenson, price 5s. 6d.

Cost of Church Buildings.

UPPER CLAPTON, N.—W. F. writes: "What is a price to cube a rather plain Wesleyan Church (red brick and stone dressings); also a Sunday-school, near the Lancashire coast? What is a good and cheap stone to use in the church—a lightish colour preferred?"

We believe that Longridge stone will be found a useful kind to use for the purpose required; some particulars are to be found in Rivington's "Building Construction," Part III., Materials, in the table of Sandstones. It has been extensively used in Blackpool, Southport, and other towns, the town-hall at Preston being an example of forty years' weathering. The prices on trucks at the quarries (Tootal Height Quarry Company, Limited, Longridge) vary from 1s. 3d. per ft. cub. of best brown-coloured stone for jambs, heads, sills, &c., to 1s. for blue stone. It is a little stiff in the working. There is little difference in estimating the cost of buildings per ft. cube between London and the Lancashire coast; at one office it is customary to take 8d. as the price for high-class brickwork in residences and from 10d. to 1s. for stone-dressed or all-stone buildings. In comparing the price of brick and stone it is useful to notice that stone at 1s. is equal in price to bricks at 70s. per thousand.

A. G. B.

Cubic Air Spaces in Convalescent Homes.

LONDON, W.—T. H. G. writes: "What cubic air space is necessary in a seaside convalescent home for dayrooms (adults), dayrooms (children), bedrooms (adults), bedrooms (children), isolation wards? Also, is there any objection to the windows of isolation ward being near those of ordinary bedrooms?"

Galton ("Hospital Construction") gives some useful notes on the subject of convalescent homes, but definite rules cannot be laid down as in the case of hospitals. In his opinion children should be alternated with adults in the same dormitories, and he says that the system of ventilation is a more important factor than cubic space; such dormitories may be more restricted than ordinary hospital wards, as they are used only at night. A comparison of two or three examples recently erected gives an average of from 500 to 800 cubic feet per patient in the dormitories, whether for children or adults; a dayroom provided in one instance

(in addition to the dining-hall) gives 120-150 cubic feet for each convalescent. For isolation wards the rules for infectious hospitals are: a minimum of 2,000 cubic feet per head with from 140 to 160 feet super of floor-space.

A. G. B.

Quantity Surveying.

MANSFIELD.—Q. S. writes: "Which are the best books on quantity surveying? Are there any examinations held in this subject; if so, when and where?"

"Quantities," by the late Professor Banister Fletcher, price 6s.; "Quantity Surveying," by John Leaning, F.S.I., price 12s.; "Quantities and Quantity Taking," by W. E. Davis, price 3s. 6d. These books can be obtained from Mr. B. T. Batsford, 94 High Holborn, W.C. "Q. S." should bear in mind that every quantity surveyor has his own system, and whatever system is adopted by him must be gone through with. Quantity surveying is usually learnt by apprenticeship. The Surveyors' Institution (Great George Street, Westminster) include in their syllabus an examination in quantities.

Strength of Concrete Floor.

ILFORD.—ECONOMIST writes: "What would be a safe load per sq. ft. for a concrete landing 7in. thick, 30ft. long, and 10ft. 6in. span, consisting of three-parts coke-breeze and one part Portland cement, resting on brick corbelling, and with 3½in. x 1½in. rolled steel joists, embedded in same 3ft. apart? Also, could the strength be increased to any appreciable extent by the addition of more cement, say, two and one?"

The proportion of three to one will make a strong concrete, and no higher proportion of cement would be advisable. There are no experiments recorded from which the strength of the proposed floor could be estimated with any degree of certainty. The concrete alone would safely carry about 1½ cwt. per ft. sup. at the end of three months providing it is well made, has 4in. width of bearing on each wall, and the walls are substantial. The rolled joists alone would carry about ½ cwt. per ft. sup., but they are too shallow for the span considered by themselves. Used in conjunction with the concrete they should be at the lower surface, and as the flange is too narrow to rivet on end cleats, there should be two angle brackets riveted on to the web at each end to serve as cleats and compel the concrete and rolled joist to divide the load between them. In that case the concrete would take the compression and the rolled joists the chief part of the tension, and the floor would be increased in strength, but to what extent it would be impossible to say. In laying the concrete it would be advisable to separate it into, say, 10ft. lengths, and grout up in between.

HENRY ADAMS.

Books on Lettering and Sign-writing.

NEWPORT, MON.—F. W. W. writes: "Where can I get books on the subject of sign-writing; books of designs with different styles of lettering, with explanations; or books giving explanations alone; or else sets of books relative to sign-writing?"

The best small book on lettering is Mr. Day's work "Alphabets Old and New," price 3s. 6d. net. Another good book is Decompe's "Album de Lettres," containing twenty-five coloured plates in portfolio, the price of which is 18s. 8d. post free from Mr. B. T. Batsford, 94 High Holborn, W.C. Messrs. Cassell and Co. also publish in their series of 1s. "Work" handbooks, one on "How to Write Signs, Tickets and Posters," with 170 illustrations.

SOUTH-EASTERN RAILWAY EXTENSION.

THE main objects of the works now in active progress on various parts of the South-Eastern and Chatham Railway system are to secure better approach to the metropolis, and to afford greatly increased accommodation at London Bridge, Cannon Street, and Charing Cross.

The scheme has been worked out in detail by Mr. Alfred Willis, the general manager, and Mr. Percy C. Tempest, the engineer-in-chief, and

contemplates material changes at each of the three termini named. The low-level station at London Bridge is to be converted into a passenger station possessing four platforms with a total length of 2,356ft., and a separate booking-office and a footbridge to the present station. There will be large office and warehouse accommodation, goods being received in Gravel Lane, immediately underneath the dépôt, and raised to the railway level by hydraulic lifts.

Waterloo Junction Station has already begun to assume a new shape. The old station, being entirely inadequate for present requirements, is to be replaced by a structure more worthy of such a busy centre. An additional platform has been laid upon the space secured by widening the viaduct, and the total length of the four platforms in the new station will exceed that of the existing platforms by more than 1,400ft. The new station will possess more than twice the existing accommodation, and no less than 34,000ft. super. of glazed platform roofing are now required.

The company will make a considerable addition to Charing Cross Station by extending the structure on each side. The result will be to secure 2,440ft. of new platform space, and to keep the main line and continental line quite separate from the local traffic. It has also been decided to enlarge Spa Road Station, and to provide independent platforms for up and down local trains; while, in view of the constantly growing population of the eastern districts, it has been determined to construct a new station at Rotherhithe New Road. Between St. John's and Orpington the railway is being widened, and the station at Hither Green is to be made still larger by the construction of two new platforms, devoted exclusively to main line traffic. The directors have also sanctioned certain improvements at Ashford and Tunbridge Wells, and agreed to erect extensive new sheds near the former station, so that in course of time the locomotive and carriage works may be wholly concentrated there, instead of being divided, as at present, between Longedged and Ashford.

Correspondence.

Cast-iron Stanchions.

To the Editor of THE BUILDERS' JOURNAL.
KIRKCALDY.

SIR,—I am not quite satisfied with Mr. Henry Adams's reply to "Cronje" on page 174 in your issue for April 11th with regard to the strength of cast-iron stanchions. Referring to the accompanying sketch, I believe that bracing the two legs together as at A *must* necessarily strengthen the framing, in spite of Gordon's or Hodgkinson's formulæ, even if the risk of bending is alone considered. I know of no formula by which this design of stanchion may be calculated and I do not consider that Gordon's or Hodgkinson's formulæ are applicable except in connection with isolated single stanchions or columns where no such bracing exists.

It has been found that *single* stanchions—as I call them—when of a height not exceeding five diameters yield wholly by crushing, and from five to thirty yield partly by crushing and partly by bending; therefore it would seem evident that if the chances of bending are reduced by the insertion of braces that the stanchion becomes very much stronger.

Then, again, there seems to be such a great jump from five to thirty diameters that one would think that the formula applied to a column or stanchion of, say, six diameters could not give justice to one of thirty diameters. However, it is the two-legged stanchion in which I am most particularly interested, and I hold that, if braced together, it would be very much stronger than two isolated columns or stanchions, each equal in section to the leg of the double one.—Yours faithfully,
D. FORBES SMITH, A.R.I.B.A.

A.A. SUMMER VISITS.

CHRIST'S HOSPITAL SCHOOLS, HORSHAM.

ON Saturday last, June 30th, the second summer visit of the Architectural Association took place to the new Christ's Hospital Schools at Horsham.

This magnificent series of structures is being erected, and is now partially completed, from the designs of Mr. Aston-Webb, A.R.A., and Mr. Ingress Bell, by whose kind courtesy the members were enabled to thoroughly inspect the buildings.

Stow, the antiquary, tells us that this celebrated school owes its foundation to a remarkable sermon preached at Westminster, by Ridley, Bishop of London, before King Edward VI.; wherein in the most powerful manner he laid before the king the poverty, difficulties, and the neglect of the poor by the wealthy classes of the day, and in the name of humanity and religion demanded an instant remedy. The young king, we are told, was so impressed that he sent for Ridley after the service, and, at the end of a long conversation, requested his assistance, and that of the Lord Mayor and citizens, to remedy the distress; the result being the foundation of the celebrated hospitals of St. Bartholomew and St. Thomas; and for the children the magnificent buildings of the Grey Friars Monastery in Newgate Street, which were in perfect preservation—and lasted so until the great fire—were used, the first number placed in them being 350 poor children. When restored the school after the fire, and built the very beautiful red brick and stone front towards Newgate Street that we see to-day, together with the present church, which he erected upon the foundations of the ancient monastic choir. The buildings contain only one side of the mediæval cloister, and some other remains. The place underwent another remodelling in 1829 by an architect named Shaw, who made the place as we see it. About 1890 a discussion arose as to the removal of the school to the country. Finally an estate at Horsham was purchased, and a select number of eminent architects prepared designs in competition for a new school, the result being that the first place was awarded to Messrs. Aston-Webb and Ingress Bell.

As a plan it may be pointed out that this magnificent scheme consists of an entirely symmetrical arrangement of buildings grouped around—in the first place—a great quadrangle that measures some 300ft. by 200ft.; at its northern end is placed the nearly-completed dining-hall, a building about 150ft. by 50ft., and a trifle more, internally, than 40ft. high. This hall is a very original and fine design; on the side facing the quadrangle is a series of five square mullioned bay windows, the two end ones having their mullions brought almost to the floor level; between each bay is a picturesquely treated door with a window above. These windows on Saturday were in appearance extremely magnificent, being filled with the costly old stained glass emblems removed from the windows in the great hall in Newgate Street. The roof is panelled in Oregon pine; the interior generally is to be panelled, but it is not yet fixed; the general effect nevertheless is extremely fine. Behind this hall rises the tower; and beyond there is the great kitchen block, with its entire service departments, steward's house, &c. At the southern end of the quadrangle and connected with it by a cloister on either side are the great hall, with a large building on either side intended to contain class-rooms for the 850 scholars, the chapel with accommodation for 1,000 people, and the music school. The foundations of these buildings have been laid; they have yet to be erected. The science schools on the east side have been built, together with the art school.

Stretching away to the east and the west of the dining-hall, and communicating with the service department behind it by an underground passage very cleverly planned, are the boarding-houses, built on the "block" plan, usually associated with hospital design. Each of these houses contains dormitories for 100

boys; six of them have been built, and the remaining two are in course of construction. The western line of houses terminates in the preparatory schools, the eastern in the large infirmary. About 140ft. from the centre of each of these houses are the dwellings of the masters, and adjoining the chapel is the head master's residence. In the design throughout it has been the aim of the architects to obtain full sunlight to every department together with a complete circulation of air to the whole of the buildings; these are warmed by steam and lighted by electricity.

Throughout the elevations are treated in an original rendering of the style of the sixteenth and seventeenth centuries, in red brick and stone, with mullioned windows, gables, and red-tiled roofs, obtaining by good proportions and great restraint and disposition of masses an extremely picturesque yet monumental effect.

Everything was shown to the members personally by Mr. Aston-Webb and Mr. Ingress Bell with the most painstaking care and trouble possible. H. D. W.

NEW SEWAGE WORKS AT BRIGHOUSE.

THE large sewage scheme which has been undertaken by the borough of Brighouse, and has been under construction during the last five years, is now nearing completion. Mr. A. M. Fowler, C.E., of Manchester, formulated the scheme. The site is situated on the south side of Cooper Bridge railway station, bounded on one side by the main line of the Lancashire and Yorkshire Railway, and on the other three sides by the River Calder, the fifty acres of land (secured at a cost of £15,000) being really a triangular plot. Contracts for the construction of the works were let in 1896. The principal constructor was Mr. G. Taylor, of Blackburn, whose contract for the outfall works and certain specified sewers amounted to £42,747 0s. 1d., while for tanks, buildings, &c., at the outfall works the amount was £18,655 5s. 11d. Eight large settling tanks have been erected, into which sewage will flow by natural gravitation, the scheme of the engineer being to collect all the sewage to one point by natural gravitation, and there treat it by means of lime, possibly with the addition of sulphate of alumina. The solids will be precipitated as the sewage passes through the tanks, and the effluent water, after it flows from the tanks, will be turned on to about 40 acres of farm land, and will then, in a purified state, find its way into the river. The outfall works have been designed with a view to be adaptable to any kind of chemical treatment. The buildings include an engine-house, a spacious caretaker's residence, two committee-rooms, and other offices, and sheds, &c., for various purposes. A tall stone chimney-stack has also been erected. The buildings have been built of local stone.

Starting from the outfall works, there is a huge bricked trunk sewer, by means of which the whole of the sewage is carried down the Calder Valley from Brighouse to the outfall works. Inside the borough itself there are no fewer than nine main sewers, all of which unite and empty into the main trunk sewer. The scheme provides for a flow of sewage equal to 30 gals. per head per diem of the population, and the main sewers have been designed to meet the requirements of double the present population, which (including out-districts) may be put at 37,000. Each of the eight tanks of the reservoirs at the sewage works measures 75ft. 6in. by 37ft. 6in., and is 6ft. 9in. deep. The machinery in the buildings at the outfall works includes an apparatus for compressing the sludge. The settling tanks at the works, it is estimated, will take eight hours' flow of sewage, and at the present rate more than a day's flow. The Local Government Board have already sanctioned an expenditure of £119,000 for sewage works purposes, and it is confidently anticipated that more money will have to be borrowed before the completion of the scheme, but whether the sum total will reach £150,000—the Mayor's estimate—remains to be seen.

Mr. Rudyard Kipling, our readers may be interested to know, was an "architect, or house-builder," before he became an author.

COMING EVENTS.

Thursday, July 5.

INSTITUTION OF CIVIL ENGINEERS.—Reception at Guildhall. 9 p.m.

SOCIETY FOR THE PROMOTION OF HELLENIC STUDIES.—Annual Meeting.

ROYAL INSTITUTE OF PAINTERS IN WATER-COLOURS.—Soirée Musicale in aid of the Francis Joseph Institute.

Saturday, July 7.

NORTHERN ARCHITECTURAL ASSOCIATION.—Annual Excursion to Leyburn, &c., and to visit Spennithorne, Middleham, and Jervaulx.

PEOPLE'S PALACE ARCHITECTURAL SOCIETY.—Visit to Metropolitan Fire Brigade Station, Southwark Bridge Road, S.E.

Wednesday, July 11.

INSTITUTE OF SANITARY ENGINEERS.—Meetings of the General Purposes and Finance Committee, 3.30 p.m., and of the Election Committee, 5 p.m.

Saturday, July 14.

ARCHITECTURAL ASSOCIATION.—Third Summer Visit to Mr. O. Eames Rempes' House, Hayward's Heath, and to Cuckfield Place.

Saturday, July 21.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS, NEWCASTLE-UPON-TYNE.—Council Meeting. 1.30 p.m.

Saturday, July 28.

ARCHITECTURAL ASSOCIATION.—Fourth Summer Visit to Stowe House, Buckingham, and Buckingham Church.

Engineering Notes.

Mr. Frank Howarth, of the London County Council staff, has been appointed chief water engineer of the Plymouth Corporation.

New Water-Supply Works at Tomintoul, Banffs., have been executed by Messrs. Jenkins and Marr, C.E., of Aberdeen. Mr. J. H. Clark, Elgin, was the contractor, and Mr. Thomas Drysdale acted as superintendent.

St. Charles's Catholic Church, Liverpool, is being warmed by Messrs. John King, Limited, engineers, of Liverpool, who are at present installing the latest improved hot-water apparatus.

Electricity in Bulk.—The preambles of the electric power supply Bills now before Parliament have been proved. The South Wales Bill has a capital of £1,000,000; the Durham Bill, £360,000; and the Lancashire Bill, £4,000,000.

The New Workhouse Infirmary, Skipton, is being warmed and ventilated by means of Shorland's patent Manchester stoves, patent exhaust roof-ventilators, and special inlet panels—supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Electric Lighting at Poplar.—The Poplar District Board of Works is about to complete its municipal electric lighting installation, which has been laid down at a cost of £70,000. The cables have been laid, and in the majority of the main roads the arc standards have already been placed in position. It is anticipated that in the course of a month or so the large generating station at Bromley will be ready to be opened.

Electric Trams for South London.—A Select Committee of the House of Commons passed last week the Bill promoted by the London County Council for the use of electric traction on their tramways from Westminster Bridge to Tooting, and from Blackfriars Bridge to Streatham. The Bill further provides for the construction of a generating station at Camberwell, and for the extension of eleven lines in North London.

Sir Alexander R. Binnie, Chief Engineer to the London County Council, was last week presented with the honorary freedom and livery of the Turners' Company. In returning thanks he said that he regretted that the water supply of London stood now in the same position as it occupied ten years ago. At the bottom of the question there was the great financial difficulty involved in taking the water supply out of the hands of private enterprise. He quoted a

sentence from the report of Lord Llandaff's Committee, to the effect that it was to be wished that someone could now purchase and take over those areas in Wales from which London water must ultimately come.

Tramways.—The following table, showing the extent of the tramways of the United Kingdom and the means by which they are worked, is taken from a little pamphlet entitled "Tramway Statistics," issued by the Ocean Accident and Guarantee Corporation, Limited:—

Style.	Length of route.		Length of track.	
	Miles.	Per cent.	Miles.	Per cent.
Steam	242	21.11	297	17.89
Cable	34	2.95	68	4.08
Electric	303	26.37	460	27.70
Horse	569	49.57	835	50.33
Total	1,148	100.00	1,660	100.00

Manchester Tramways: New Works.

—An important step towards the establishment of municipal electric tramways throughout Manchester and the district was taken recently, when the foundation-stone of the car shed which is to be built at Queen's Road, Cheetham, was laid. It is estimated that the shed will be the largest of its kind in Europe. Accommodation will be provided for 252 cars. The area of ground to be covered is about four acres, and the works, when completed, will consist of a front building towards Queen's Road 255ft. long by 33ft. wide, comprising offices, guards' and drivers' mess-room, mechanics' shop, store and other rooms, and a house for the yard foreman. There will be an entrance gateway 16ft. wide in Queen's Road to a covered approach road 48ft. wide, with track lines leading to fourteen bays of sheds (each 37ft. wide) arranged at right angles thereto and parallel to Queen's Road. The principals of the shed roofs will consist of about 400 tons of steel, carried by steel girders on about 100 cast-iron columns; the roofs will be covered by boards and slating and about 60,000 sq. yds. of patent glazing. The total estimated cost of the work is £11,000.

Surveying and Sanitary Notes.

Yarmouth "Rows" Threatened.

A movement is on foot in Yarmouth to improve away some, at least, of the "rows" for which that town is famous.

Improvements at Wisbech.—The Wisbech Town Council has adopted a scheme for paving and improving the streets in accordance with an estimate prepared by the Borough Surveyor, and for widening Walsoken and Blackfriars bridges, at a total cost, including contingencies, of £9,250.

Sewerage Question at Stamford.

At the last meeting of the Stamford Town Council the Mayor's proposal to proceed at once with a new sewerage scheme, with outfall works, &c., was negatived, though the present system is that known as the "tub" system, and is costing the town £1,300 a year. The Council has been directed by the Local Government Board to effect an improvement within two months.

What Widening Schemes Cost in London.—At last Friday's conference of members of the London County Council and representatives of Metropolitan Vestries and District Boards, held at the County Hall, Spring Gardens, the chairman (Mr. Dickinson) said that the Ludgate Hill widening (15ft.) resulted in an expenditure at the rate of £2,000,000 per mile; the Fleet Street widening (10ft.) £3,000,000 per mile; and the Strand widening £6,000,000 per mile.

For the New London Boroughs.

Canon Barnett, the head of Toynbee Hall, has issued a document in which it is insisted that an adequate staff of sanitary inspectors shall be appointed in connection with the new

London boroughs, the minimum being one inspector to 15,000 of the population. Some of the inspectors should be women. It also advises that a house-to-house inspection shall be made at frequent intervals, and that the sanitary part of the work of the new councils shall be performed with the greatest stringency. Also, that the councils shall insist on efficient paving, watering, and cleansing of the roads and streets, make provision for more open spaces, and shall take full advantage of the Housing of the Working Classes Act.

New Companies.

New Clyde and Tyne South African Syndicate, Limited.

This company was registered on June 6th, with a capital of £50,000 in £1 shares, to adopt and carry into effect an agreement with the Clyde and Tyne South African Syndicate, Limited, for the acquisition of the business of the said company, and, generally, to carry on in all or any of their respective branches the businesses of quarry owners, stone merchants, brick and tile makers, lime burners, dealers in sand, lime, and cement; as cabinet makers, carpenters, builders, timber merchants, &c. The first directors (of whom there shall be not less than three nor more than seven) are to be elected by the signatories to the memorandum of association, Messrs. A. C. Berthon, C. S. Jacottet, H. R. J. Aphorpe, A. E. Stone, E. d'Avray, A. F. Lee, and C. H. Norton.

Yorkshire Estate Company, Limited.

This company was registered on June 9th with a capital of £50,000 in £10 shares, to acquire any real or personal property, lands, estates, buildings, &c., in Hull or elsewhere, and, generally, to carry on in all or any of their respective branches the businesses of builders and contractors, decorators, painters, plumbers and glaziers, general merchants, dealers in every description of stone, sand, lime, brick, tile, and terra-cotta manufacturers, dealers in slates, timber, hardware, and building requisites generally. The first directors (of whom there shall be not less than five nor more than nine) are W. A. Gelder, R. Foster, F. Crampton, T. Middleton, G. Tether, W. R. Smith, W. C. Bradley, and W. W. North.

Seacombe Pressed Brick and Tile Works, Limited.

This company was registered on June 12th with a capital of £30,000 in £10 shares to carry on the business of brick, tile, pottery, earthenware, terra-cotta, ceramic ware, and artificial stone manufacturers, &c. The first directors (to number not less than three nor more than five) are D. B. Rappart, W. H. Wilson, T. Wilson, C. B. and Walter J. Wigg.

Bracknell Brick and Tile Company, Limited.

This company was registered on June 12th with a capital of £6,000 in £1 shares to carry on the business of brick and tile manufacturers and merchants. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers.

James E. Beard and Co., Ltd.

This company was registered on June 14th with a capital of £5,000 in £1 shares to carry on the business of builders' merchants, dealers in earth, chalk, clay, gravel, sand, stone, coal, granite, marble, wood, iron, concrete, cement, mortar, lime, bricks, tiles, pipes, and other materials and accessories, &c. The first directors (to number not less than two nor more than seven) are J. E. Beard and J. S. Robertson, the former being permanent governing director and chairman.

The site of the Blue Coat School, in Newgate Street, is proposed to be acquired for St. Bartholomew's Hospital. The school is being removed to Horsham.

Keystones.

The Spire of the Parish Church at Cold Overton, Leicestershire, was recently struck by lightning and levelled to the battlements.

Change of Address.—Mr. Robert J. Beale, A.R.I.B.A., has removed his offices from 9, Victoria Street to Broadway House, Westminster, S.W.

Flats with no Stairs are now being built in New York. The upper floors are reached by an elevator, and a fire-escape runs down the outside of the building from each storey.

At St. Patrick's Roman Catholic Church, Dundalk, a new three-manual organ has been erected by Messrs. Henry Willis and Sons, of London, at a cost of £1,800.

Building Trades Gift to the Nation.—At a meeting of the Executive and Stewards held on Wednesday last it was stated that the contributions in kind and money had reached £2,2500.

New Asylum Buildings for North Wales.—In the North Wales Counties Lunatic Asylum report it is announced that £99,000 will have to be spent on additional asylum buildings.

The Ancient Abbey Church of Sempringham, in Lincolnshire, famous in monastic annals, has been enriched by the addition of a porch over the finely-carved Norman doorway, as a memorial of Her Majesty's Diamond Jubilee.

Ilfracombe Building Society Scandal.—Joseph Braund, formerly Secretary of the Ilfracombe Permanent Building Society, has been sentenced to three years' penal servitude for embezzling the moneys of the society.

Builders' Clerks' Benevolent Institution.—At a special meeting of this institution held last week the son of the late Mr. C. J. Hick, a former pensioner, was elected for presentation to the Orphan Working School, Haverstock Hill.

Public Improvement in St. Luke's Parish, E.C.—The narrow thoroughfare known as Central Street, St. Luke's—a continuation of the improved Golden Lane—is to be widened by the London County Council at a cost of £77,750.

No. 8 Parkshot, Richmond, Surrey.—A correspondent to a contemporary pleads for the preservation of this house (as its demolition is imminent), because George Eliot there wrote the "Scenes of Clerical Life" and practically all of "Adam Bede."

The Late General Wauchope's Memorial.—The memorial which is to be erected to the late General Wauchope at Niddrie, Midlothian, takes the form of a Celtic cross, 9ft. high; with the stepped base it reaches a height of 14ft.

Barry Carpenters' Dispute.—The dispute between the Barry master builders and the carpenters and joiners in the district has now lasted two months. The masters have rejected the overtures of the men, and both seem determined to see who can wait the longest.

New London Hospital.—The foundation-stone of the new Belgrave Hospital for Children in Clapham Road, S.W., was laid on Wednesday by Princess Henry of Battenberg. The building will cost £50,000, and has been designed by Mr. H. Percy Adams, F.R.I.B.A.

The Death is Announced of Mr. Melford Teulon, F.R.I.B.A., at the age of seventy-eight. He was the originator and designer of the Strand improvement scheme and the new street from the Strand to Holborn. He was also the founder of the City Churches and Churchyards Protection Society.

Gladstone Statue in Athens.—Preliminary works have been commenced in the University Square, at Athens, for the erection of the statue to Mr. Gladstone. The statue was subscribed for some years ago by the students of the University of Athens, and was there executed by the sculptor to whom the order was given.

Fleet Street Improvements.—A correspondent to a contemporary urges that, in view of the rebuilding of the southern side of Fleet Street at the Ludgate Circus end, the approach to St. Bride's Church should be widened. This would be very desirable, but land is extremely valuable in Fleet Street, and it is to be feared that curtailment rather than widening will be effected.

Archæological Discoveries in the City.—While workmen were digging the foundations for commercial buildings to replace old tenement houses in Ireland Yard, a narrow passage near Doctor's Commons, they came upon several vaults packed with human bones. The mouldings of an Early English window and a well-preserved Norman column and capital, of which the London and Middlesex Archæological Society has taken drawings, were also discovered.

Work Abroad.—In Victoria (Australia) there is a good demand for a limited number of thoroughly skilled plumbers on the Melbourne drainage works. In Queensland there is a moderate demand for carpenters, stone-masons, and bricklayers. Western Australia has a sufficient supply of building trade workmen. Further information can be obtained from the Emigrants' Information Office, 31 Broadway, Westminster, S.W. Persons are warned against going to South Africa in search of work while the war lasts.

St. Katharine's Church, South-bourne, near Bournemouth, has just been completed by the addition of a chancel and two bays to the nave. The style is Early English, and one of the special features is a kind of ambulatory at the back of the choir, so that communicants can return to their seats without passing through the chancel. A series of stained-glass windows in the aisles are

filled with representations of notable personages who have been connected with the Diocese of Winchester from the earliest times. The additions to the building have cost about £5,000.

The Jenny Lind Infirmary, Norwich.—was opened on Saturday by the Prince of Wales. A description of the building will be found on pp. 310-11 of our issue for May 30th last.

Architects for the New Street.—The eight architects who will submit designs for the buildings fronting on to the Strand in connection with the great new street are:—Mr. Mervyn Macartney, Mr. E. W. Mountford, Mr. Ernest Runtz, Mr. Leonard Stokes, Mr. Reginald Blomfield, Mr. Ernest George, Mr. William Flockhart, and Mr. Henry T. Hare. The first four were chosen by the Improvement Committee of the L.C.C., and the last four by the Royal Institute of British Architects. The time for sending in designs has been extended to September 17th.

Court of Common Council.—At last Thursday's meeting of the Council the Streets Committee recommended that they should be authorised forthwith to take the necessary steps for the removal of all derelict and unidentified wires in the city. The Court agreed.—This committee, in a report as to the necessity for cleansing, painting, and repairing the bridge over Farringdon Street, and the statues on the Holborn Viaduct, also recommended that they should be authorised to have the works carried out at an estimated cost of about £500. The Court approved.—The tenders of Messrs. John Mowlem and Co. for mason's and pavior's work for three years (terminable at the end of the first or second years), at 15 per cent. above schedule prices, were accepted. The tender of Mr. A. Woodhouse for the reparation of sewers for three years (terminable at the end of the first or second years), at 8½ per cent. above schedule prices, was also accepted.

"Architectural Review" Competition.—Owing to difficulties in obtaining site plans, the closing day for this competition (which is for a villa on the Riviera) has been postponed.

Trade and Craft.

Messrs. Kent and Sons.

The well-known and much-respected firm of G. B. Kent and Sons, brush manufacturers, having head offices at Farringdon Road and factories at Victoria Park, have decided to form their business into a limited company, and the prospectus (showing a capital of £160,000) will be found in another part of this week's number. The issue will be for Five-and-a-Half per Cent. Preference Shares, and as these will carry half interest in the profits after 10 per cent. has been paid on the Ordinary shares, they should form a most attractive investment for the public. We have an assurance that the trade will have a preferential allotment, and no doubt a large number of members of the trade will take full advantage of this opportunity. The prospectus is being issued through the offices of Messrs. G. H. and A. M. Jay, of 17 Old Broad Street, E.C. Messrs. Kent and Sons inform us that the prices of bristles having steadily advanced since they issued their painting-brush catalogue at the commencement of this year, it is necessary now to again raise the prices of bristle brushes. For orders received after June 30th the present ruling prices of all brushes in their painting-brush catalogue from pp. 7 to 20, and glue brushes, p. 31, will be advanced 10 per cent.

Wood-working Machines.

Though the architecture of the nineteenth century has little that it can call its own, and is rapid in most of its details, the science of engineering possesses quite a different record—in fact, it may be said that never before has the employment of mechanical aids for utilitarian ends been so extensive. This is specially noticeable in connection with wood-working machines. During the past twenty-five years a great number of improvements in wood-working machines have been introduced, with the result that those now obtainable do marvellous execution. But with all this speed and all this output a new danger has arisen, that of injury to the workmen employed in working the machines, a danger which created that ambiguous and intricate statute—the Workmen's Compensation Act. To cope with

it, various forms of guards have been devised. The guard for verticle spindle-moulding machines made by Messrs. F. W. Reynolds and Co., saw-mill and general engineers, of Acorn Works, Edward Street, Blackfriars Road, London, S.E., consists of a plate to cover the cutters which rises and falls on a standard fixed by two screws to the table; it can also slide on a horizontal arm to accommodate long or short cutters. It is quickly removable and costs 45s. The non-automatic emery grinder made by the firm for planing and moulding irons carries a cup emery wheel at one end of a horizontal spindle for grinding plane irons and an emery disc at the other end for moulding irons. Fast and loose pulleys, guards, and a slide worked by hand for carrying the plane irons are provided. The price of the machine for grinding irons up to 18in. long is £10 10s. In designing a guard for a circular saw Messrs. Reynolds endeavoured to obtain the greatest safety to the workman with the least hindrance to his work. This result has been achieved by making the guard flat and supporting it horizontally over the saw on the arm of a standard fixed to the bench. The features of the guard are that it is simple, strong, and does not require adjustment for different thicknesses of wood. An excellent machine made by Messrs. Reynolds and Co. is one that will plane, try-up, joint, rebate, work mouldings or sash-bars, groove, chamfer, stop-chamfer, and do a large variety of work up to 12in. wide. The material is passed by hand over the cutters and follows off true on the finishing table, which is 3ft. long. The tables are carried on four inclined guides and can be moved by screws, while the fence is made to cant 45 deg. for bevel planing. Another useful machine is the "Queen" hand-power combined circular and band sawing machine with self-acting feed and rising and falling spindle. The bench table is 3ft. 10in. by 2ft. and is perfectly clear at each end for cross-cutting to any length. The band saw will cut up to 7½in. deep and is driven from the power shaft by simple spur gearing, which increases its speed and makes it cut cleaner than if it were driven direct; the circular saw will cut up to 4½in. deep. The price complete is £28 10s. Those who use or require wood-working machines of any kind will do well to consult Messrs. Reynolds and Co., who are well known as makers of really efficient apparatus at moderate prices.

An Architectural Causerie.

Some Humours of Stone-laying.

"BEWARE," says Thoreau, "of the occasion which requires new clothes!" The warning has been brought home to us anew by a curious postcard, enclosed with an invitation, now lying before us, to a public ceremony performed in London but a few days ago. The card is directed to a well-known firm of tailors, and evidently relates to a footnote on the ticket:—*Academic dress will be worn.* On the back is a printed form to be filled in by the intending visitor:—"Please have ready for me at Gate . . . the following costume (please say whether *new or hire*)—Gown, hood, and cap, degree . . . University . . . My height is . . ft. . . in. Hat measurements, length . . breadth . . . Name and address . . . N.B.—We shall be present to attend to the robing." There is something distinctly modern in the idea of this enterprising costumier waylaying us in the lobby to deck us in garments proper to our scholarship, but so unfamiliar to our person that they must be specially ordered for "stone-laying day." It might almost be said to "add a new terror" to those architectural celebrations which make life worth living to the florist and the pickpocket, bring lusty patriotism to the roofs and windows, and hopelessly disorganise the omnibus traffic for the best hours of the day. The affectation of changing our usual attire on festive occasions for "best clothes" of a much more purgatorial character has been satirised often enough. But to assume, instead of them, a uniform which we never really wear in the exercise of those talents which it symbolises, is to reduce a graceful piece of public ritual to the level of a fancy dress ball.

It is difficult, of course, in our present civilisation to awaken any real public enthusiasm over a new building, or the civic institution which it stands for, so small is the general interest in architecture, so far removed are the arts and handicrafts from the topics of conversation in the street. On the other hand, how dearly the British public delights in pageantry—how it hails an excuse for a dressing-up and a procession—the recent patriotic carnivals have amply shown us. The problem is to restore this natural instinct for the processional to a higher place in social life, and to relate it to matters no less worth joyful acclaim than military prowess, and to make the ceremonial itself more sincere, intelligent, and beautiful. At the best, we are too sternly practical a nation to make a festival of nature worship, to go forth like the Japanese to greet the almond blossom in spring, or to watch, like our Druid forefathers, the sun rise over the altar of Stonehenge on Midsummer Day. We reserve our thanks-

givings—too exclusively perhaps—for events of social life and human achievement. And to those who heard Miss May Morris's lecture at the Arts and Crafts Exhibition on "Pageantry and the Masque" it appeared that the seamy side of such festivities was less sordid in the Middle Ages than to-day. Patronage was not then so commercial in spirit: craftsmanship was more democratic: the celebration of a stone "well and truly laid" was not a matter of a select lunch for the mayor, the architects, the titled visitors, and a few privileged ticket-holders.

How different must such ceremonies have been to the happy builder untrammelled by modern difficulties of sites and tenders! No painful memories of demolished slums intrude

the luncheon-tent, and the academic dress lays hideous snares for the footsteps of the unpractised wearer. Sometimes even, when he should be attending to the Doxology, the National Anthem, or the "Absent-minded Beggar," a doubt may assail him as to whether certain structures lightly thrown up as a building to be "opened" on a date convenient to Royalty will really hold together on the day of the ceremony, or may not open themselves with an "unrehearsed effect" of a disastrous character. There is at the present moment a technical institute in the North which is being confessedly "scamped" to get it ready for that festive occasion, and with the full intention of pulling it down and rebuilding properly when the Royal visit is over! Then there is the photographer with the pocket kodak, whose single care is to find that place in the proscenium where he will be

A SKETCH ON A GERMAN TOUR (see p 417). BY J. HUTCHINGS, A.R.I.B.A.

between the white tablet and the silver trowel—not designed in those days by one of the juniors in the office, who had already done more to the "practical working out" of the plans than the firm always cared to acknowledge. The palaces of the Goths were never hindered by long and ignominious squabbles with the owners of tenement property, or sudden outbursts of sentiments of hygiene and justice from "ancient light" holders who had formerly betrayed no weakness for sunshine and air. These are but a few of the oppressions which weigh upon the spirits of the modern architect when the gay bunting flaps loudly in the wind, and the caterer flits worriedly about

in everybody's way, and where the ordinary visitor, detecting him, will go in bodily fear of being "snapshotted" at any moment.

The sufferings of the architect at the hands of the Board or Corporation with whom the undertaking lies would afford another interesting chapter in his diary, and he might find it difficult to say which of the two masters he would rather serve—the committee of a charitable institution, or a municipal body with ten thousand implacable burghers behind it. In either case the pioneer of new ideals in architecture will often think with sympathy of the builders of Jerusalem, whose task was divided between the trowel and the sword.

E. W.

Architecture as an Applied Art.

ARCHITECTS with a desire—a right and laudable desire—to magnify their calling sometimes claim that architecture is one of the Fine Arts. I would suggest that we consider it as an applied art—an art applied to works of utility. The old distinction between "Fine Art" and "Industrial Art" is illogical and misleading. Every art is *fine* if it assists in rendering the surroundings of our daily life finer; and every art is *industrial* if it requires the work of more than one individual in its production. The better division is that of Pure Art and Applied Art. Pure Art, in which the work of art exists in itself independently of any other object and for the primary purpose of influencing the emotions, such as the group of the Laocoon, the picture of the Transfiguration, the oratorio of "Elijah," the drama of the "Alcestis," or the poem of the "Inferno." Applied art is that in which the work exists independently of the art, and the art is applied for the primary purpose of adding beauty and pleasing the æsthetic sense—such as the terra-cotta festoons on the Pavian Certosa, the painted Pilaster ornaments at Pompeii, the drum-and-bugle music for military marching, or the "A-was-an-Archer" rhyme that teaches the alphabet. The art that is termed architecture, though the mother-art and the chief-art, being thus the result of buildings-made-beautiful (Building + Beauty = Architecture), must be considered as an applied art. It is well to clear the ground by this admission—an admission in one sense, but a great claim in another—the claim to be the art not of the few but of the whole; not the art which can be shut up in a courtyard, or a rich man's gallery, or heard only in a concert hall, or enjoyed only in a theatre, but the art that is outside and over all these, that is beheld of the people and understood of the people. This great embracing art, that surrounds us—that we cannot escape from—that no one can selfishly hide from us—that is one of the best forms of the history of our race, the traces of which exist in an unbroken chain from the earliest historic times to our own—that is our parish; and the student of this great applied art of architecture will avoid some mistakes by regarding it in that light. H. H. S.

William Morris's Practical Side.

MANY writers fail to do justice to the practical side of William Morris's character. His allusions to himself as a "dreamer of dreams, born out of my due time," were written in his early manhood, while still under the influence of the so-called Gothic Revival, and before his youthful enthusiasm had been tempered and chastened by contact with the world. Morris, early in life, in common with Nesfield, R. Norman Shaw, and other ardent followers of Pugin, abandoned the hope of reviving Gothic Art, and extended his admiration to all forms of art—Elizabethan, Jacobean, Renaissance, call it what you will. That Morris was not wholly a dreamer of dreams is evidenced by his attempts to revive the almost extinct industries of stained glass, wood engraving, tapestry weaving, embroidery, type cutting, book-binding, and other arts, in all of which he achieved a certain amount of success, if he did not actually realise all he had hoped to accomplish. He very soon discontinued the manufacture of stained glass as an article of commerce, although assisted by some of the most eminent designers in this branch of art, being convinced that no good results could be obtained from the manner in which the manufacture was conducted, and in this he showed his common-sense and practical wisdom. His endeavours to raise the position of the workman, to give him an interest in his work, and to lift him from the condition of being "a mere machine of a machine," in which he was not unsuccessful, must be set down to his practical character. J. H.

On Reflection.

German Architecture.

lar nation expresses the character and emotions of the race, and becomes, as it were, a tangible embodiment of the social history of the country, then you are under the necessity of declaring what form of mental disease modern Germany is afflicted with. The exponents of this theory will here find their opinions sorely tried, and although the idea has only so far been connected with the venerable buildings left us by the Craft Guilds and our forerunners, the probability is that future generations will judge German work by this method, and that our children's children may detect in our self-conscious and timid-looking buildings symptoms of the vacillation and unrest which characterise our present-day existence. Some philosophers hold to the opinion that the art of a nation increases in grandeur inversely as its political power declines. If there be any truth in the theory it is a somewhat appalling thought that art can only be achieved at the price of political decadence. Be that as it may, these philosophers and their disciples will doubtless agree that the militarism of Germany and its increasing power as a nation are at the bottom of the defects in its artistic production. But the architecture of Germany shows no loss of vitality, and herein confutes the idea given above, for her design is entirely novel and unconventional, and exhibits nothing of the mediocre copybook work which is the usual symptom of decline in art. Nor does the art-flourishing-in-time-of-peace theory fit the case better, for Germany has been at peace now for thirty years and her architecture to-day is worse than ever before.

Some Shocking Examples.

THAT German design is bad, however, is beyond question. The German architectural papers are a kind of artistic nightmare. Imagine, if you can, a house that has dragons and snakes careering over the outside and inside walls, trees rooting in the skirting-boards and blossoming in the ceiling, noisome beasts clambering all over the woodwork, windows without two panes the same size and shape, doors guiltless of a straight line, and metalwork that would do credit to the maddest imagination. Imagine this confection of horrors, and try and contemplate what life would be in such a home. Even as we write, the latest number of the "Berliner Architekturwelt" has come to hand, and we find a piece of detail for a house that merits description. This piece of sculpture occurs on the end of a one-storey outbuilding, probably part of the offices. There are two columns, carrying nothing, and between them is a recess. At the top of this opening is an enormous female head, on a scale about eight times larger than that of the building, cut off at the neck, and supported apparently by a bar that runs midway across the recess. The head is very plentifully supplied with hair, which trails down behind and below the bar, and also works its way behind the columns and coils itself into neat panels on the outer sides. Surmounting the head and the crown of water-lilies is a castle or building which bears a faint resemblance to Newgate Prison. Underneath the chin two imps with webbed hands are pushing their way through the coils of hair and scrambling over the bar. At the top of each column is a small armless nude female figure standing on a scallop-shell—stuck on to the column apparently—and to keep her from falling she is thoughtfully tied to the column with a double cord round the waist, knotted in the middle. We should like to know the meaning of this, and also what relation it bears to the building. We have mentioned it as an instance, a mild

instance, of what is being done in Germany, and as these monstrosities do not seem to be in accord with German life and character, we can only conclude that stress of competition has driven each German architect to designing something, no matter what, so long as it differs from the work of his professional brethren. No other hypothesis seems possible, for some of the designs exhibit an ingenuity that is akin to madness.

Builders' Copybooks.

THE proposition put forward at the recent Architectural Congress to compile pattern books of details for the use of builders engaged in speculative work, or work erected without the assistance of an architect, would seem worthy of adoption. The idea is, of course, to check the perpetuation of bad detail which at present disfigures such building, and to convince builders that it will cost them no more, but probably less, to erect a house that is simple, effective, and artistically sound. It is needless to say that such patterns would be of a simple and elementary character, and that there are many difficulties to be surmounted before the project can be realised. The composition of a book which will give general satisfaction is in itself no small task, and beyond that the promoters will have to bring the builders to their way of thinking. It is assumed that this will easily be accomplished, because it can be pointed out to builders that they will save money by the omission of the frippery which is complained of. This is a moot point, because it carries with it a further assumption that the public does not appreciate the builders' architecture and would welcome the proposed improvement. We have never suspected the speculative builder of spending more money upon his erections than he was absolutely obliged, and that he does spend much money upon bad ornament and tinsel attractions would seem to argue a stronger underlying reason than blind custom. It must not be forgotten that his object is to sell as soon as possible, and if the plain and severely simple house does not attract customers he stands to lose money on the speculation. We have sufficient faith that the general public would choose a more artistic type of house if they had the opportunity; but we do not think they would care to live in a house absolutely devoid of ornament. We do not believe any architect would care to do so either. If the proposition aims at the substitution of good ornament and detail for bad we wish it all success. If it aims at eliminating ornament altogether it will fail. But on the principle that things could not be worse and might be better we think some further steps should be taken in the matter.

Lay Criticism.

THE Architectural Congress is dismissed in one short paragraph in the current number of "The Review of the Week," and our contemporary opines that the reasons for the unsatisfactory state of architecture to-day are much deeper than a mere want of technical knowledge on the part of the public. This criticism is all right so far as it goes; but it goes very little way. We are inclined to agree that the public is blamed more than it deserves, but that does not help the situation much. "The Review of the Week" would better have earned our thanks if it had informed the outer world of these deeper reasons that are apparently within its immediate knowledge. Presumably the gentlemen responsible for its production are but laymen in matters architectural, but still laymen, we hope, possessing some artistic taste and common sense, and if they devoted some intelligent criticism to the subject as it occurs to them they might assist architects greatly in rehabilitating a national art. Such criticism would at least be purposeful and might tell us something that we do not already know.

A GERMAN TOUR.

By JOHN HUTCHINGS, A.R.I.B.A.

THE following remarks are merely intended to accompany and elucidate a series of sketches made during a brief tour up the Rhine and back through Strasburg and Rouen, and are accordingly of a meagre and incomplete character.

As the author travelled direct to Cologne, and there commenced his labours, he will ask his readers to transport themselves in spirit to that ancient historical city, equally resourceful in beautiful churches and subtle odours.

How curiously does the architecture here contrast with that of Britain! A new world of ideas is presented to the surprised and delighted eye of the English visitor. Not that our own work is in any sense inferior: the effect is mainly due to an element of novelty; huge mass is seen combined with fantastic, frequently uncouth, forms. It is at once rendered manifest that our architects did not always hit on identical solutions to the problems that confronted them in common with their Continental *confrères*, or that they necessarily chose the best ones; and no little instruction is to be derived from observing how differently the German thought and operated, and to what diverse results he was led. Other qualities are also abundantly evident, such as the national idiosyncrasy, the influence of native tradition, and varying ideals.

Therefore a singular pleasure is to be derived from wandering about the narrow tortuous streets of the older parts of the city; every turn in the road revealing new objects for reflection and enjoyment: a colossal church tower, some quaint feature of jutting gable, overhanging turret, carved bracket, or fretted window. The ancient municipal hall testifies to the trade of a bygone age; a crumbling fragment of palatial magnificence recalls a splendid but extinct aristocracy; past deeds of charity survive in hospitals for the sick, which, though to be condemned on sanitary grounds, remain a delight to the eye, instead of a blot on the landscape. Above all, religious faith has bequeathed to posterity nobler

Cologne.
J. Hutchings

records in unassuming monastery and majestic church.

But to descend from the general to the particular, the principal glory of Cologne lies in its wealth of ecclesiastic monuments—many of them dating back to times when the Archbishop of the diocese rivalled princes in dignity, wealth, and equipage, vied with them in the field at the head of a host of armed retainers, and excited their envy by his magnificent attire, splendid suit, and regal hospitality.

The Cathedral, whose mighty fabric required six centuries to rear, was commenced amid much pomp and ceremony in 1248. The choir was finished in 1322, and the work slowly and intermittently progressed until 1500. After a lapse of 300 years operations (recommenced by William III. in accordance with the original design) were steadily continued by succeeding monarchs to final completion.

This architectural Colossus secures our admiration as an exhibition of piety and a display of enormous expenditure, also as an illustration of German determination and perseverance; but an artistic creation it is not, despite the vast dimensions, unity of style, and mechanical exactness of detail. The necessity of correct proportions and harmonious composition was seemingly eclipsed by the all-absorbing idea of astonishing the world by a work of enormous magnitude. To the indiscriminating public, however, "to whom vastness is synonymous with sublimity, and exuberance of detail with beauty, the structure gives unmixed satisfaction."

The church of St. Martin, built in the round arched style, before the introduction of pointed forms, cannot fail to enlist the sympathy of the antiquarian, on account of its great age and native forms; nor is the appeal to the artist less powerful owing to the simple propriety of the details, due harmony between void and solid, and an expression of stability, suggestive of true dignity and strength.

St. Andreas still retains its old square tower with semicircular headed openings and arched corbel table; though the balustrade and domical two-storeyed termination are to be attributed to a Renaissance architect. The body of the church is typically illustrative of German Gothic, particularly the tall narrow windows, divided by long lean mullions, depending for support upon the iron stay-bars, to which the leaded glass is secured; as also the enormous mass of roof, from which one rightly conjectures that the three aisles are all of one height. There are some elegantly-carved Re-

naissance bench-ends, which slightly mitigate the barren, cold, and stilted effect of the interior.

There is no more advantageous position than the deck of the Rhine boat from which to obtain a general view of the city. The more important buildings stand out against the sky from amidst a swarm of roofs of every shape and colour. In particular the mighty "Dom" rears its enormous bulk high over every other landmark, and soars above them all, as a mighty mountain dominates the crags and hillocks crowding its base. Below, the wharves bespeak bustle and activity: swarms of lightermen file to and fro from ship to quay, as, threading its way between the lines of barges and steam tugs, the boat proceeds upon its voyage, flanked by the plain which extends in uniform insipidity to within a few miles of Bonn. Before reaching the latter place, however, the seven mountains loom majestically forth, threatening to bar the passage, and as the vessel winds amongst them, Königswinter is passed, whose quarries furnished the material for the great Cathedral. On speeds the boat through narrow defile and open country, a panorama of ever-changing aspect, dotted with villages, which appear clusters of quaint slated houses, with fantastic roofs, crowding round the still more fantastic church tower. Castles, too, of all periods, rude fortresses for the most part devoid of ornamentation occupying almost every available crag, suggest many a theme for pencil and brush. Here a monastery nestles amongst the trees, there stands a gloomy and threatening ruin, mayhap the scene of darker deeds than have been recorded in legend and story. Here fragments of fortification, accentuated by bastion, watch-tower, and gatehouse, proclaim a centre of military importance in past history; there a crowd of small craft and rows of ware-houses denote a place of modern commercial activity. Forward still, borne on the narrowing bosom of the stream, the pine-clad mountains encroach, and rocky precipices frown from their heights. Surely this is fittingly the land of fay and ogre; here lived and sported the giants and elves which adorn the pages of Andersen; with a swing to one side we pass the old toll-house—Pfalz, occupying a rocky islet—a building of threatening walls, connecting numberless towers and turrets, slated in the most grotesque forms, a regular fairy palace, which by some happy chance has survived to

STREET IN STRASBURG.

link this sceptical matter-of-fact age with the glamourous romances of ruder and more imaginative times.

But leaving behind the domain of myth and fable, Bingen is reached, where, abandoning the

Bingen.
J. Hutchings.

steamer, we proceed to investigate the streets, with an eye for anything of interest.

The prototype of the church might have been some huge barn, divided into three aisles of the height of the tie-beam, and the walls pierced with the usual lean windows, so conspicuously absent is the slightest indication of proportion. Yet to this ignominious body is attached a tower and slate spire of extreme elegance, decorated with a reserve and propriety lacking in many of the larger and more imposing examples.

A tiled roof is rarely seen in this district, local slates maintaining an undisputed monopoly. They are commonly cut into small diamond shapes, and laid in diagonal lines with the ridge and eaves, instead of in parallel rows after our custom.

The architect will not find his Elysium here, though a few tasteful features, such as an overhanging bay window decorated with carving and embellished with the Roman eagle, may reward his search. For the landscapist the neighbourhood abounds in good subject-matter.

Heidelberg, the scene of our next sojourn, held out great promises, yet expectation failed to exceed the limits of reality. Famous for a historical University and a no less historical Palace, the latter remains a worthy relic of that proud epoch in her career when the city occupied the position of capital of the Palatinate. The royal fortress, conspicuous from every part of the little town that lies at its feet, frowns high above it, set on a spur of Jettbuhl; its base is swathed in many-tinted foliage, and the upper portions are thrown out into strong relief against the pine-clad uplands beyond. Once the defence, and, if need occasioned, the scourge of the neighbourhood, it was then, as now, its richest ornament, and one whose peculiar charm is heightened by a setting of unrivalled beauty and grandeur. The group of buildings is composed of a number of diverse elements which lend an additional fascination to the *ensemble*.

The angle best seen from the plain is accentuated by the tall and graceful campanile of the horloge; a massive, lofty square erection named the Giant's Tower bars and dignifies the entrance. Styles of all periods are represented, from the massive tower, bastion, and walls designed to resist attack during the warlike Middle Ages, sparsely relieved by battlements and an occasional loophole, to the florid

times of Friedrich, when strongholds were superseded by palaces, in all respects luxurious, spacious, and well-appointed residences. The fretted and fantastic gables of the latter period stand in juxtaposition to their simple and sturdy prototypes; the unadorned majesty of the one challenges the extensive fenestration and elaborate embellishment of the other. And then the effects which time has wrought, leaving an ancient bastion practically as strong and forbidding as on the day of its completion, and a comparatively modern wing in a state of crumbling decay. Here and there ivy has lent a treacherous support to the gaping masonry, covering rent and fissure with a mantle of evergreen. Thus stands this antique castle, the finest ruin of its class in all Germany, and unsurpassed anywhere in beauty of situation. The approach from Leopoldstrasse ascends steeply to the comparatively level platform from which the fortress rises, and traversing one side by leafy walks, meandering among well-kept lawns, beyond the florid gateway (erected by Heinrich V. in honour of his English queen, Elizabeth), passes over a bridge and through the gateway of the Giant's Tower.

Flanking the spectator on the right stands a colonnaded wing of semi-Gothic character; beyond, on the same hand, the kitchen buildings, separated by the austere Ludwig's tower from the rich Italian front of Otto Heinrich (1556) rising to a height of three storeys, and rich in sculpture inspired from such widely divergent sources as German history, Christian lore, and pagan tradition.

The octagonal bell tower occupies the angle; whilst the elegant superimposed arcades of Friedrich II., the dual gabled addition by Friedrich IV. in rampant rococo, together with a modest little Gothic chapel, constitute the return wing. To the left, broken walls, the mere shells of what had evidently been handsome apartments, complete the circuit of the spacious irregular enclosure.

The terrace fronting Friedrichbau is one of the pleasantest retreats within the castle ward, and affords an admirable view of the town, spread out upon the plain far below, which stretches in unbroken sequence beyond manufacturing Mannheim, whose smoking chimneys are dimly visible through the distant haze.

The general plan of the city is simple. Three principal arteries run in parallel lines from end to end, intersected by numerous cross-ways. The most prominent object, and therefore the first to attract the eye, is the fifteenth-century Church of the Holy Ghost, a glorified barn possessing a lofty tower of

remarkable excellence. The nave of this edifice belongs to the Lutherans, who worship within its walls according to the traditions of their order; the Catholics have a vested interest in the choir, but satisfied with the sense of possession they wisely abstain from insisting upon their prerogative, to the inevitable annoyance of both parties.

Opposite the west end of this church a street leads directly to the "Alte Brücke" (see p. 415) which spans the Neckar, passing through a severe Classic gateway, flanked by two round Gothic towers, garnished with beautiful conical roofs.

The University, though an old foundation

THE RATH-HAUS, COLOGNE.

and doubtless a most useful building, presents an unedifying exterior, whence even the picturesque element is entirely absent.

Heidelberg's past has been extremely chequered, and owing to repeated and comparatively recent conflagrations few remnants of the Middle Ages survive. The inn, Ritter St. George, built by a French refugee from the massacre of St. Bartholomew, is an exception and an excellent example of its kind. The rest of the street architecture is of a low order, though here and there an elegant detail, such as the gateway illustrated, agreeably relieves the prevailing monotony.

The neighbouring Black Forest revels in enchanting scenery. We chanced one evening to arrive at Siegelhausen—an unimportant village, apparently pitched haphazard on the banks of the Neckar, and struggling up to the edge of a pine-clad slope. As we crossed the river by the ferry, many-mooded Nature presented us with a spectacle of unwonted grandeur. Huge rounded hills swept upwards from the valley, on whose sides the pines climbed and massed, looking black and jagged against the sky, still faintly illumined by the rosy trail of the departed sun, and casting nigrescent reflections upon the surface of the stream. On the unshadowed expanse a boat swung to her anchor, with tapering mast clearly defined against the fading distance. Close at hand appeared the dark houses of the village, the lighted windows irregularly mirrored upon the palpitating bosom of the river, and all the while the water murmured and swished as it hurried with an eternal onward motion to swell the volume of the majestic Rhine.

Baden-Baden, but a short journey from Heidelberg, and located on the skirts of the Black Forest, competes with the latter in beauty of situation and picturesque environment. But the onward march of modern improvements has metamorphosed the once ancient town into a city of straight boulevards

and broad squares. It is eminently respectable, mathematically regular, but excessively dull and commonplace. The Trinkhalle is worth visiting, on account of the Gotzenberger frescoes; and the Conversationhaus is palatial in scale and decoration. Public buildings, places of amusement, and churches of all denominations and nationalities abound to an extraordinary extent, but the chief attractions of this celebrated watering-place are the public gardens and walks.

Despite an indiscriminating epidemic of restoration and demolition, a few forlorn fragments still remain, a standing protest to the shoddy soulless work of the modern. One of the most noteworthy is the Neue Schloss, which, perched on an eminence overlooking the town, poses well from below. It also possesses a history not unmarked by event, though merely dating from 1479. Enlarged in 1570, it suffered severely from fire in 1689, underwent partial restoration, and is now a residence of the Grand Duke. The angle turrets, with their curious roofs, agreeably break the skyline and supply that element of the picturesque which is the life and soul of German mediævalism.

Beneath the shadow of the castle the abbey church projects its gaunt proportions from an open square. Indigenous in every particular, the exterior is poverty-stricken, the windows weak and attenuated, the entrances mean and insignificant. The tower, capped by dome on dome in diminishing stages, though far from spirited is the most interesting portion of the structure. These German towers call to mind very forcibly some of Wren's designs for London church steeples. The entrances, two in number, are at the sides in accordance with the tradition of the country, originated when the dual apse was in vogue, a plan which rendered a lateral position for the doorways imperative.

An extremely elegant stone fountain of Renaissance design stands opposite the west end of the church.

The Alte Schloss—1,550ft. above the sea level and two miles distant—is a mutilated unadorned shell, whose days of usefulness were numbered by the French in 1689. It is approached by an ascending roadway, winding through umbrageous pine forests, a cool and gloomy retreat from the oppressive midday

heat; and the top of the battered keep offers an extensive and magnificent prospect, affording a fair idea of the type of scenery that obtains in the Black Forest and Rhine basin.

Baden is a fashionable resort, Strasburg is a manufacturing and old-world city; the former has been brought to accord with modern taste, the latter is a conglomeration of all ages, the gradual accretion of centuries; the one attracts crowds by reason of its rich and varied scenery, the other exerts its spell upon a more select company—the lover of the antique, the artist and dilettante. The surrounding landscape devoid of beauty, in Strasburg centres the whole charm, but a charm, though differing in kind, as fascinating to the cultured eye of the architect as anything nature has to offer, with all her grandeur and breadth of resource.

Strasburg makes her *début* upon the stage of history under the name of Argentoratum, and

appears in the chronicle of events as the site of a great victory, won by Julian over the Allemanni in 357 A.D. Her citizens, ever foremost in the struggle for liberty against the usurpations of prince and noble, secured her enfranchisement as a free German town in the thirteenth century. These sturdy old burghers of the Middle Ages, relying more upon stone walls than municipal charters, proceeded to raise a fortification around them, and, so equipped by their enterprise and prudence, they were able to defy the unscrupulous rapacity of the feudal baron, and at times even dictated terms. While knight and soldier, fired by the fanatical spirit which animated the crusader, hankered for opportunities to slaughter the enemies of the Cross and to win for themselves renown and immortality at a blow, these practical old fellows stayed at home, seizing the opportunity to enlarge their privileges and to extend their trade. Many were the struggles in which Strasburg played a heroic part, many the sieges she has gallantly sustained. In 1681, owing to the treachery of Louis XIV., who took possession of the capital of Alsace in a time of peace, she became a portion of the French Empire, until wrested back by the strong hand of the German in 1870, after a resistance so stubborn and sustained that her fortifications were almost annihilated by the terrific bombardment.

On leaving the railway station, one is immediately lost amongst a bewildering maze of narrow tortuous streets, in which the picturesque element reigns rampant. In piquant irregularity appear quaintly-carved shop fronts, supporting overhanging storeys, widening as they mount upwards to such an extent that the sky is reduced to a mere strip; curious long low windows filled with leaded glass; gables decked out in twisted and carved parapets or richly decorated barge-boards, and furnished with doors and cranes for the hoisting and admission of goods. Open balconies protected by cut and turned balustrade and supported by column and post; high-pitched roofs covered with slate or pantile, or perchance a patchwork of both materials; turrets, towers, spires, domes of all imaginable shapes and sizes, twisted and

warped by the shrinkage of the timber, placed in every conceivable position—such objects are evident in endless variety. Here stands a building of stone, weather-worn and stained by a thousand storms; there a stucco front, streaked by the rain, and patched again and again. In one a fresh coat of colour thrusts itself upon the observer with aggressive crudeness, till he turns for relief to a less assertive neighbour, bleached and washed into variegated and subdued greys. Amongst the mass a fragment of old red brickwork peers out, and the medley is plentifully interspersed with timber framing dark and rich in tone, exhibiting all the resources of the carver's art, or severely constructive.

Sooner or later the wanderer's steps lead him to the Münster-Platz. The plan of the cathedral is of the orthodox cruciform type. The transepts (in one of which the round arch appears) and apse date back to the eleventh and twelfth centuries. The nave, erected during the thirteenth century, is on a much more extensive scale than the older portions of the structure. The west front, though divided into three somewhat rigid divisions, both horizontally and

HEIDELBERG CASTLE.

vertically, and covered with detail and carving of superb workmanship, but on a scale too minute and refined to justify their position, is a masterly conception; and despite want of repose and apparent stability the immense size, the wealth of decoration and marvellous delicacy of execution, together with much that is happy and artistic in form, more than compensate for the few defects, and produce a result which awakens the noblest and most delightful emotions. The octagonal tower and spire of pierced tracery, rising to a height of 468ft., are simply marvels of constructive skill and intricacy of workmanship, and they possess an appearance of lightness and airy elegance fanciful and captivating in the extreme.

The tall western screen, which is considerably higher than the nave roof behind, is evidently a survival of a similar feature still existing in some of the early Rhenish churches, and which in some examples assumed the form of a connecting gallery between two towers.

Many of the windows are adorned with fine glass, and the interior retains some good furniture in addition to several wrought-iron grilles of excellent design and execution. Mention must also be made of the celebrated astronomical clock, situated in the south transept—a perfect triumph of mechanical ingenuity.

Several of the more ancient and important buildings possess qualities of design worthy of special study—such as the Frauenhaus in the Schloss-Platz (16th century); also in Gutenbergs-Platz, the Hôtel du Commerce and several commercial houses.

The Germans worship genius no less than ourselves, an instinct which is demonstrated by the bust of Goethe in bas-relief distinguishing No. 36 Alte Fischmarkt, where the poet dwelt during his student days at the University.

Doorway
Heidelberg
Fischmarkt.

On market days, curious old-fashioned costumes are frequently seen, worn by peasants from the outlying villages, who still cling tenaciously to modes long since abandoned elsewhere.

The fascinations of Strasburg might still have held us in thrall but for the importunate calls of business, accompanied by an alarming decrease in our funds; and therefore, to avoid missing Paris and Rouen, we were obliged to hurry our departure.

After a brief sojourn at the metropolis we hastened to that splendid episcopal city Rouen, with which our own past history is so intimately connected. Sometimes termed the Manchester of France, it is fortunately but a seedling Manchester as yet, and though much has been destroyed and commercialised, much remains—enough to enable us to realise its pristine glory.

What a wealth of monumental art appears on every hand, the magnificent heritage bequeathed to us by the brilliant genius of a past age! While gazing, we—creatures of the nineteenth century, we, favourites of Nature, with our science and superior attainments—cease to sneer at the ignorance, narrow-mindedness and superstition of the mediæval; forced sadly to admit that, however we may excel in other fields of labour, our art appears incomparably mean against such masterpieces as these. And the well-worn question may well be asked again—Whether the loss of art has been sufficiently compensated by the gain in

luxury and scholarship. That knowledge is cheap at any price is a recognised truism, but no reason is forthcoming to show that art is incompatible with the highest mental development; rather the evidence suggests a reverse conclusion.

Rouen is *par excellence* a city of churches. It is impossible to go anywhere, however unlikely the locality, but a church appears prominently in the scene. Many of them are huge enough to fulfil the functions of cathedrals in less favoured lands, but here they take second or third rank, and all possess features of interest which space will not permit us to enlarge upon.

At the corner of two streets a tower of stately proportions is divided into a number of storeys occupied as tenement dwellings. In a narrow lane the nave of another once beautiful fane—judging from the solitary pinnacle and flamboyant window that survive—protracts a melancholy existence as a warehouse, regardless of its former glory and hallowed associations.

The matchless west front of the cathedral is familiar to all lovers of art and literature through the eloquent pen of Mr. Ruskin.

St. Ouen's, though decadent in detail, is otherwise a strikingly beautiful structure, of supreme elegance and lightness combined with immense height. This church embodies the ideal of fourteenth-century French architects; their object was to reduce the supporting area to a minimum, and to proportionally increase the size of the stained-glass windows. The

lofty lantern tower over the crossing almost suggests English influence.

The great church of St. Maclou has a very curious western portal.

The Archbishop's Palace is on a superb scale, and presents an imposing appearance, although a complete restoration of the exterior has robbed the structure of much of its individuality. The numerous slums form the most delightful sketching ground; quaintness and originality thrive where the courts are narrowest and foulest. Timber is here almost universally employed, and the arched barge-board recurs again and again, but with such happy application that the result is always pleasing and satisfactory.

But there is an end to all things. Yet, as we bade the Continent a reluctant adieu, we felt nerved and braced afresh for the great battle of life, and the example of the masters who had wrought so nobly convinced us that a still higher destiny awaits the human race, when it shall be revealed how impotent material well-being alone is to satisfy the aspirations of the expanding intelligence; and in those days our deserts of brick and mortar shall bloom and blossom into forms of exquisite beauty and grace, to which all the accessory arts shall contribute; the craftsman shall once again—and in a fuller sense than heretofore—find joy and gladness in his labour, and shall preach in his chosen material the gospel that is in him, and life shall be ecstatic, transcendental, divine.

CURRENT PERIODICALS.

The **A.A. Notes** for July are not of paramount interest, if one excepts the particulars of the Banister Fletcher Bursary, which appear on another page of this issue. Mr. W. M. Fawcett summarises the results of the recent congress, and finds "the by-laws now in force are harassing and annoying" and that "they do not even pretend to assist the artistic side of our work," as "they are only in existence to make buildings strong and sanitary—two very good objects." For the last phrase we are thankful. There is no reason of course why beauty should not be combined with sanitation and strength. But architects who wish to secure the removal of restrictions that hamper their art should be careful to avoid even the appearance of hostility to regulations that are really demanded in the interests of the public health and safety. We are glad to see the last of Mr. Bulkeley Cresswell's "Philosophy of Hall-marks," upon which no more fitting criticism could be passed than that appearing above the name of Mr. J. D. Grace in another part of the issue.

Architecture (New York) for June contains some amusing excerpts from a speech by Mr. Louis H. Sullivan at the annual dinner of the American Architectural League. Mr.

Strasbourg
St. Ouen.

Sullivan criticises thus trenchantly:—"American architecture is composed, in the hundred, of ninety parts aberration, eight parts indifference, one part poverty, and one part Little Lord Fauntleroy. You can have the prescription filled at any architectural department-store or select architectural millinery establishment." And again:—"That you have abundant reason for discontent needs no proof:—Let him read who runs through the streets. That you have cause, for discontent is evident. That you should feel discontent gives one a delightfully cynical sense of shock, and a new-born desire to believe in the good, the true, the beautiful, and the young." We hope Mr. Sullivan will not come to England—at least, not just yet.

The Canadian Architect and Builder for June calls attention to the fact that architects as a body know less about electrical work than they should. Possibly the ideals of our Canadian brethren differ from our own, and probably they believe that an architect should understand the principles of the work executed under his direction. It is to be regretted that on this side of the Atlantic there are some who appear to regard artistic taste as a substitute for practical knowledge.

The Architectural Review (Boston) for June contains an appreciative article on the art of Frank Lloyd Wright, whose work we should like to know more of; but the illustrations are too small, and, in the case of the plates, hardly clear enough to afford a very good idea of the detail by which the work would mainly be judged. His treatment is quite unconventional, and the exteriors are quiet and restrained. The difficulty of getting fair tenders for modern building work is, apparently, an evil that is not peculiar to this side of the Atlantic. Our contemporary, in a leaderette, remarks on the wide variations in a set of estimates, and says:—"This used to be attributed to incomplete plans or specifications, but now plans and specifications for estimating upon are pretty generally found to be complete and fairly perfect, but the wide variation of bids continues. It shows itself even in cases where there is no possibility of ambiguity in the material or labour to be performed. It can be accounted for only by the risks which the contractor runs and the extent to which he is ready to gamble on the chances. Risks on the price of material, which he cannot always contract for ahead; risks on the price of labour, which he cannot control; risks on strikes, which must mean, at the very least, loss of time, and, at the most, legal and other expenses as well; finally, risks as to the amount of work he can get out of his men. There was a time when the idle or incapable workman could be discharged without another thought, but now an employer thinks twice before he discharges such an one. Besides this, he may find the efficiency of his men arbitrarily limited

at a point below what they are easily capable of doing." The architectural designs at the Royal Academy reproduced in the "Architectural Review" (London) are reviewed, and the collection is denounced as "even more dull than usual," as "few drawings show any vitality or modernness of design. . . . The public and monumental architecture is niggled and ineffective."

The Home Counties Magazine for July contains an article on the Old Gate-House of Lincoln's Inn, Stow's "fair antient Gate-house," which forms with the chambers on the north of it the only buildings of any antiquity left in Chancery Lane. Mr. W. Paley Baildon has unearthed some curious information about the building of the gate-house, and his article is illustrated by two drawings by Mr. Hanslip Fletcher and a reproduction of an old print showing the building as it appeared in 1800. The author says that of London's once numerous gate-houses but four remain, viz. St. James' Palace, Lambeth Palace, Lincoln's Inn, and St. John's, Clerkenwell. Yet this very number of the "Home Counties Magazine" shows that there is a fifth, No. 17 Fleet Street, the Inner Temple gate-house, which forms the subject of an article by Mr. Philip Norman. Much has been written about this most interesting house, the destruction of which was threatened a little while ago, but has happily been averted. Few, however, can write with the authority and knowledge of Mr. Norman, and his article, embellished as it is with excellent photographs and measured drawings, is a valuable addition to the literature of the subject. Speaking of the beautiful coloured ceiling on the first floor, Mr. Norman remarks upon the extraordinary tenacity with which it holds together, though in parts it has sunk many inches. This, he says, is owing to the fine quality of the plaster, which is far superior to any now produced, perhaps also to an admixture of hair and of some glutinous substance which holds it to-

gether. The only other article of architectural interest in this number is one on Littlebury Church, a building which dates from the twelfth century.

The Reliquary this month has a seasonable holiday appearance, and anyone contemplating a holiday in Cornwall or in Monmouthshire is likely to be specially interested in this number. "Some Monmouthshire Sketches," by Mr. J. Russell Larkby, is a most interesting description, illustrated with a capital collection of sketches by the author of some of the ancient churches in Monmouthshire. The subject is treated architecturally, and is instructive as well as entertaining. The church of St. Woolos, Newport, with its fine Norman doorway containing strange-looking diminishing shafts—which some declare to be not Norman at all but Roman—and wonderfully interesting capitals illustrating the story of the Flood, is dealt with at considerable length. Llanthony Abbey, which the author considers the most beautifully situated of all the English abbeys, is also examined and illustrated with great care. The "Reliquary" is so carefully produced that one is surprised to find that a glaring grammatical error in the last sentence of this article has been allowed to pass uncorrected. The other article of special interest to holiday makers is one by the Rev. S. Barber, entitled "Round about Padstow." This is of a less technical character than Mr. Larkby's, and is illustrated by some good photographic reproductions of Cornish churches.

The Journal of the R.I.B.A. for June 16 contains a short article—little more than a note—by Mr. R. Phené Spiers on "The Architecture of Central Syria." The subject is a deeply interesting one, which we hope to see dealt with more fully by Mr. Spiers on a future occasion. Some excellent photographs accompany the article. Mr. Arthur Cates gives some

interesting particulars on "Architectural Education in the United States." This is one of the matters in which our American cousins have been making great progress of late years. Not long ago the American architectural student would almost as a matter of course spend a year or two in Paris imbibing the artistic principles of the *École des Beaux Arts*; to-day he can get as good an education in his own country as anywhere, and the result of this must inevitably be seen in the American architecture of the future. In the following passage Mr. Cates lays his finger upon a very serious defect in our English system of training architects:—"In too many cases the education of a young architect in this country is limited to what he may 'pick up' in the office, of which the payment by his parents of a considerable premium has entitled him—a lad raw from school, who has not yet learnt how to learn—to have 'the run'; where, if capable and industrious, he will be taught so far as may be necessary to enable him to take part in the office work, and to waste that time which should have been occupied in the completion of his education to the still further advantage of his master by taking the place of a paid assistant; or he may, if so disposed, cultivate artistic and dilettante indolence, and render himself incapable of thereafter taking an active part in the work of life. In either case his future position would be very different from that which he might have attained had the time so spent in the office been appropriated to systematic education." In striking contrast to this state of affairs is the systematic way in which the American universities and such institutes as the Massachusetts Institute of Technology lay themselves out to meet the needs of architectural students. The *Journal* for June 30 contains nothing of special interest.

The *Genealogical Magazine* gives the place of honour to a review of Lyon's new book "Heraldry in Relation to Scottish History and Art." "Lyon" is not—as the uninitiated might suppose—a nickname either of affection or derision, but is the recognised appellation of Sir James Balfour Paul, Lyon King of Arms, a portrait of whom is given in connection with the article. The number is as full as usual of curious lore about names, pedigrees and coats of arms. The Marriotts will be pleased to know, on the authority of the learned author of "Names derived from Egypt," that theirs is probably the oldest of English names, being derived from Marcotis, the name of a district of ancient Egypt. But the presence of the name *Σαυβ* in a papyrus dated 227 B.C. is not held to justify the Smiths in claiming an equally ancient origin.

The *Antiquary* contains an article on "Curious Ancient Customs in Italy," and some rather amusing extracts from the diary of one Mr. George Bowles, who made a journey from the south of Ireland to London in 1761 and 1762. Mr. W. Hencage Legge does well to call attention to the beauty and interest of some of the village churches of Sussex, and his note and illustration on a "Trinita" in old painted glass in Rodmell Church deal with a subject of much interest to antiquarians.

The *Clayworker* (Indianapolis, U.S.A.) is full of sound practical information for those engaged in the brick and tile industries; the difficulty with such a periodical must be to avoid making it dull and heavy. This difficulty seems to have been quite overcome, and the number before us is very bright and interesting, as well as practically useful. A representative of the journal has been visiting France and England and recording his impressions. His remarks about London are very interesting:—"The brick architecture of London, as I saw it, is very ordinary. Plain red brick, laid in white mortar with stone trimmings, is the rule. I saw no terra-cotta or press brick-fronts at all. I did see an occasional structure faced with enamelled brick. These are usually in gaudy colours. Aside from this feature, London architecture is so similar that I am inclined to think many, many years ago there was an architect who planned these structures, and his designs and specifications have been in use ever since. It will not surprise me to learn that this architect was also a stonemason. So far

as I discovered there is no variety or originality displayed in the residential architecture of London."

The *Journal of Decorative Art* for July contains a number of sketches at the National Gallery by Mr. E. Fairhurst, presented as studies for designers and decorators. The idea is a good one, but the design should be used as suggestions rather than as actual copies. The sketches consist of panels from picture frame designs, from the backgrounds of pictures, and from dresses, &c. In the details of some of the old pictures of the Venetian and Tuscan schools there is an astonishing wealth of suggestion for the designer and decorator, and many, no doubt, will thank Mr. Fairhurst for the hint. Continuing his articles for students, Mr. John A. Sherlock deals in this number with the origin and history of diapers, illustrating his remarks with a good selection of sketches.

Feilden's Magazine is undoubtedly one of the most attractive of technical magazines. It is most ably edited, and produced with great care. The July number contains, amongst other interesting features, an account of the widening of the Great Northern Railway between Finsbury Park and Wood Green, an article by Mr. Ewart C. Amos on "Pneumatic Tools and Appliances," and a well illustrated description of a pneumatic tool factory recently opened at Chippenham. Professor Jacques Boyer gives a readable description of the buildings of the Paris Exhibition. His account of the method of construction adopted in the majority of the buildings is interesting: "The skeleton of the building is constructed of iron covered with wood, which, in its turn, is covered with staff. . . . Staff is nothing but a combination of packing canvas and plaster, and it serves advantageously as a substitute, as far as solidity is concerned, for the ordinary plaster casts. Its employment offers no difficulties. The first thing is to get a hollow mould of the object which is to be reproduced, and to grease or oil it, so as to render easy the removal of the cast. The next is to pour into the mould liquid plaster to form the outer surface of the casting. Then, before the plaster has become quite solid, pieces of canvas soaked in plaster are pressed into the mould, which, combining with the still moist outer layer, form a compact and intimately mixed crust about 1 c.m. in thickness. Finally, in order to give still greater solidity to the casting, it is supported by small wooden rods, forming the inner skeleton of the statue or architectural design reproduced; and, after having carefully attended to all these details, there remains nothing but to remove the cast from the mould. For the more important plane surfaces required in the structures of the Exposition, instead of the hemp or canvas, suitable for stiffening plastic work of minor dimensions, a more solid material has been employed to cover the woodwork, and, according to circumstances, either 'expanded metal'—a kind of metallic network recently invented by M. Golding—or cane trellis-work, or even nets of stiff and strong cords, have been selected." The article is illustrated with some excellent photographs.

The *Engineering Times* has an article by Dr. Winter Blyth on "Aerobic Processes of Sewage Disposal," which, with the aid of diagrams, explains the various processes very clearly. Mr. C. G. Brackenbury continues his articles on "Methods of Saving Labour in Gas-works," and Mr. W. Fletcher, in his comprehensive survey of the "History and Development of Motor Cars," deals this month with "Electrically Propelled Carriages." There may be differences of opinion as to the extent to which it is likely or desirable that mechanically propelled vehicles should take the place of those drawn by horses; but few will doubt that among the various mechanical motors the electric motor is destined to take the first place. Mr. Fletcher's description of the electric motor's "points" is rather striking:—"It can be made to any size and it will go at any power you require, according to its size. The electrical motor applies itself, with almost human intelligence, to the task it has to perform. It is self-regulating, and the energy expended upon it varies exactly with the work it has to do. In going up hill it voluntarily and automatically

applies its shoulder to the wheel. In going down hill, it not only acts as a brake, but it also tends to restore to the battery the energy taken out of it. So, acting as a brake, it saves the tyres, and, returning the energy, it supplies again the force which it has consumed from the battery." For next month a specially interesting number of this magazine is promised; it will be devoted to a full account of the engineering exhibits at the Paris Exhibition.

The *Artist* contains a very readable and well illustrated article on "Architecture and Exterior Decoration at the Paris Exhibition. We are so familiar by this time with the appearance of many of the buildings that it is a relief to find at last a magazine containing illustrations of decorative details. Some of these are very interesting and do something to redeem the architectural poverty of the exhibition buildings, taken as a whole. The author, who calls himself "W. Fred," points out very justly that the architects of the exhibition palaces seem to have considered nothing but decoration:—"They had no thought of turning to advantage the plane itself, or it may have appeared to them too poor, too inartistic. Every gate, every colonnade, every bridge, every wooden decoration was to show many 'ideas.' And in hunting for arabesques, for ornaments, for pictorial—in absence of architectural—ideas, the builders have lost every feeling for the limitations of formative art. Unbearable haste and nervous excitement mark all the buildings that have a decided exhibition character." Some of the small buildings are undoubtedly much more pleasing than the palaces, but we are surprised to see "W. Fred" bestowing approval on such a weird freak as the "pavillon bleu." Certainly it is modern and original, and we quite agree with the author's remark that the Exhibition contains far too little of the architecture of to-day, but modernity and originality are not the only qualities we should demand—even in an exhibition building.

The *Quarry* for July contains a long article on the mineral products of Yorkshire, and some useful notes on comparative tests of cement briquettes.

The *American Architect* may almost be described as a portfolio of architectural drawings, the letterpress occupying a very subordinate place. The plates are all produced in first-class style, whether they are lithographs, heliotypes, or half-tone illustrations; but it may be doubted whether the subject matter is in all cases worthy of the expense and care bestowed upon its reproduction. In the issue for June 9th several plates are devoted to the Providence Public Library, a dignified and no doubt costly building in the classic style, but one which shows very little originality of design. Some drawings of details in the church of St. Bertrand de Comminges, in France, afford a pleasant variant to the illustrations of modern American work. The issue for June 16th contains illustrations of the Bicentennial Memorial to be erected at Detroit. The memorial consists of a great Doric column, surrounded by groups of statuary, and a great basin, flanked by flights of steps supporting colonnades, in the centre of which would stand the statue of Cadillac. A plain and uninteresting high school building, and an over-decorated façade of a New York lodging house, are other features of this number. The issue for the 23rd contains some further examples in the series of "box-stoops" which this journal is publishing, a drawing of the Evangelical Lutheran Church of the Advent in New York (the church seems to sadly lack a tower, and the drawing is a very poor one), a good example of a country house by Mr. W. A. Bates, and several examples of modern American metal work.

Electric Railways and the Observatory.—Surprising as it may seem, the running of trains on the London electric railways affects the delicate instruments of Greenwich Observatory, zigzags being marked as soon as the trains are started. The removal of the Observatory farther afield would upset all the calendars, yet the influence noted above must necessarily increase rather than decrease with the progressive extensions of the city.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"He who builds according to every man's advice will have a crooked house."—DANISH PROVERB.

Our Inset Sheets.

MR. J. W. BEAUMONT, F.R.I.B.A., of Manchester, is the architect of the new

Physical Laboratory at the Owens College in that city. The buildings have cost about £23,000, and another £10,000 will be spent on equipment, making the total £33,000. The laboratories occupy a prominent position in Coupland Street, and are connected with the college by an underground passage. Red brick and white stone have been used in the construction, on a site measuring about 100ft. by 60ft. There are about 40 rooms. Besides those intended in the first place for ordinary teaching, elementary and advanced, there are others for special research and for electro-chemical work. Glazed bricks have been used for the wall in nearly all the rooms. Appliances are provided for filtration of the air, so as to free it from dust. At the top of the building there is an observatory fitted with a 10in. telescope, the gift of Sir Thomas S. Bazley, Bart. The electric light will be used throughout the buildings. There is also an electric lift. Attached to the physical laboratory is an electro-technical laboratory, which will form a memorial of the late Dr. John Hopkinson.—The proposed house at Westmeston, in Sussex, was to have been built in brick cement, rough-cast, with a roof of red tiles, Bath stone window and door dressings, and iron casements. The proposed house at Bexhill, overlooking the sea, was to have been also of brick cement, rough-cast, with a roof of green slates, wooden window frames, and iron casements; all the outside woodwork to be painted a bright-green colour. The architect of both these houses is Mr. C. F. A. Voysey.

Work of the Old Egyptians.

THE annual exhibition of the Egypt Exploration Fund now open at University College is exceptionally interesting. During the last season all the energies of the fund have been concentrated upon work on the ancient site of the city of Abydos. Few places in Egypt were of greater importance than the sacred city of Abtu, the chief burial place of Osiris. The site had been partially explored by M. Amélineau on behalf of the Gizeh Museum, and the ground was declared to be exhausted, when permission was granted to Professor Petrie to commence work. By systematic labour and the employment of skilled workmen, whose honesty was known, and by a judicious system of payment for results, the explorer has succeeded in obtaining one of the best collections of early remains ever brought to this country, and it must be remembered that one-half of the objects remain at Gizeh. Some excellent specimens of carving exhibited show how skilful the Egyptians were in this branch of art. Metal working was confined to copper. Gold was used for decoration, and specimens of gold foil and wire are exhibited. The pottery from the early tombs is most interesting and artistic; it is all hand made, and some of it has a red hematite glaze. The decorations are derived from basket-work or rudely-painted birds and animals. An elegant door frame is placed in the first room. It is covered with beautifully-cut hieroglyphs painted blue, with the name and titles of a certain official named Amen-em-hat or Sneb, after the ruling king. On the whole the exhibition is a highly instructive one.

The Double Choir of Glasgow Cathedral.

THE lower church of Glasgow Cathedral has been called "the finest crypt in Europe," an appreciation on several grounds of questionable value. But the cathedral is not without other and notable claims to distinction. The peculiarity of the double choir, the continuous succession of periods of vaulting, and the change of design of the middle compartment are features which give it a unique place among the buildings of the middle ages. There are many of our

cathedrals that show as great variety and many that have a much wider range of style, but there is not one that presents the consecutive stages of vaulting in such intimate conjunction, and nowhere do we find so instructive an example of a later design grafted on the stumps of an earlier plan. Apart from its purity of style and beauty of design, the choir vaulting has thus a particular value as an illustration of the development of the art; it affords some insight into the methods of the mediæval builder, and shows at once his fertility of resource and impatience of restraint; finally, it offers an archaeological exercise of much interest in the recovery of a superseded plan. It is remarkable that such claims on the regard of those interested in the architecture of the middle ages should have received hitherto such slight recognition, and Mr. T. L. Watson's work (to be published shortly by Messrs. James Hedderwick and Sons, of Glasgow, with the title given at the head of this paragraph) is designed in some measure to remove this reproach.

A Few Extracts.

AS an indication of the genesis and scope of the essay, the following extracts are given from the introduction:—"Altogether, and including the upper and lower vaulting of the choir, no fewer than five distinct periods may be traced, each separated from the others by an appreciable interval of time. Each succeeding stage of the vault is marked by features characteristic of its own period, and is distinguished from the preceding stage by the introduction of a new and later type of moulding in the vaulting ribs. . . . The argument of the earlier portion of the present work—the sequence of the vaulting periods and the change of plan—will be patent to anyone who is at all conversant with the architecture of the period. Had the purpose of the writer been merely to establish these points the task would have been a short and easy one; the subject of the vaulting, however, is of wider interest and worthy of more extended consideration. As a double-vaulted church of the thirteenth century, with clerestory and aisles, the choir of Glasgow Cathedral is unique in this country—in many respects it has no parallel anywhere. Its design is such as to involve constructive difficulties in resolving which the builders were without direct precedent, and the story of the choir vaulting shows by what means these obstacles have been overcome."

The National Trust.

AT the annual meeting of the Council and Members of the National Trust for Places of Historic Interest or Natural Beauty, held last week in the Rubens Gallery at Grosvenor House, the Marquess of Dufferin and Ava remarked that there were two important objects mentioned in the report which the Society were most anxious to gain. One was the acquisition of the old Court House at Long Crendon, a pretty Buckinghamshire village, standing on the low ridge which formed the western boundary of the Vale of Aylesbury, and the other was the old post-office situated in the village street of Trevena, better known as Tintagel, in Cornwall. The Trust, through the kindness of Miss Catherine Johns, had had the opportunity of becoming the owner of the latter interesting specimen of fourteenth century architecture. Sir Robert Hunter said the Trust had acquired four properties during the year. One of them—Idle Hill, Kent—was from many points of view more valuable than any that had yet come into the hands of the Society. It comprised about 16 acres, and had been purchased for less than £1,600. He hoped this was but a mere instalment of places of interest in the south-east of England that would come into their possession. They had also acquired Duffield Castle, near Derby. To complete the purchase of Long Crendon, £350 more was wanted. Mr. A. Birrell, M.P., pointed out that the reason why places of interest were in danger of destruction was not so much in consequence of the prevailing brutality of the builder, but because of the shyness and slowness to act which was characteristic of our race.

Architecture as a Vital Art.

WITH this as his title, Mr. Percy G. Stone has been writing to the "Globe" with reference to Mr. Emerson's paper read before the Architectural Congress, a full report of which appeared in our issue for June 27th. After referring to the fact that it is the designer who must be influenced, Mr. Stone says of modern street buildings:—"One can but argue these piles of ugliness must be the work of the 'commercial' architect; the man who makes pounds, shillings, and pence the be-all-and-end-all of his profession; the man whose want of knowledge of art is only too apparent in his work; the man who draws down the anathema of a discriminating public upon the profession he unfortunately belongs to. His plan may be good, but the less said about his elevation the better. Want of proportion reigns supreme in this class of building. Wealth of detail there often is, but it is of the kind to be avoided. Certain, indeed, it is that its exponent is not 'subservient to past authorities'; better, indeed, if he were. Ignorance of beauty is the keynote of his design. . . . Objects of archaeological interest need as much protection as wild birds. Extinction threatens both alike. Buildings of intrinsic value and interest are allowed to be swept away by the all-devouring tide of 'present-day needs,' unmindful of the fact that there is a utility in the past, that there are lessons to be learned from it—lessons essential to our happiness and well-being."

National Sentiment.

"THIS, it may be urged, is an argument on purely sentimental grounds; but in a nation's peril sentiment has often proved of inestimable value in binding its people together against a common foe, and so prolonging its existence. A nation without a past is well nigh in as bad a condition as a nation without a future; its past life becomes the keynote of its present being. Take our Thames Embankment as a modern improvement, which it undeniably is; the most successful buildings along its front are Somerset House and the Houses of Parliament; the one an outcome of the Classic Renaissance, the other an example of the Gothic revival—both inspired by the past. A Committee of Control is no doubt sorely needed, but papers read before an audience of experts rarely get beyond that audience. The public seldom, if ever, hear them, and it is the public with whom we have to deal. Let the public, not the professional, papers take the matter up." The last sentence would seem to imply that the professional papers had either done nothing or had tried and failed. By all means let the public press use its great advantages for opening the eyes of the public to the fact that the bulk of our modern architecture is bad and that buildings have more claims on us than ornamented boxes. But till this is done in a little better fashion than was the case recently in a daily paper of immense circulation, the matter will be safer in the hands of the puny professional journals.

A Relic of Old Scotland.

THE Old Covenanters' House, South Queensferry, near the Forth Bridge, and a house of much historic interest, is about to be swept away, unless some antiquarian society bestirs itself for its preservation. For some years the building has been falling into a dilapidated condition, and it is now proposed to dispose of it by public roup. The house, which is also known as "Queen Margaret's Palace," is situated near the "Binks," or Rock, where Margaret, the Queen of Malcolm Canmore, was wont to land when crossing to Edinburgh from Dunfermline. It stands in the west end of the town of Queensferry, and behind the ancient Carmelite Priory, and also near the spot where Edgar Atheling, with his mother and sisters, the sainted Margaret of Scottish history, landed. The building was also the scene of another matter of historic importance, for it was here the celebrated "Queensferry Paper" was discovered. Much of the building still remains, particularly the spiral staircase up which the Covenanters went and the room in which they were attacked by the Dragoons.

MESSRS. BARCLAY'S NEW BANK PREMISES, FLEET STREET:
SIR ARTHUR BLOMFIELD AND SONS, ARCHITECTS.

NEW BANKING PREMISES IN FLEET STREET.

MESSRS. BARCLAY AND CO. are to be congratulated upon their new premises in Fleet Street, which have recently been completed and opened. It has often been said that for an architect to be able to give full scope to his abilities he should have an unlimited site and equally unlimited funds at his disposal. In this case funds seem to have been abundant, to judge from the lavish way in which the whole building has been carried out, while the restricted nature of the site has only led the architect to exercise a larger amount of skill in providing the requisite accommodation, not only in the banking department itself, but also in the two storeys set apart as the residence of the manager.

As may be seen from our illustration, the elevation has been designed in the Renaissance style. The centre portion of the façade is considerably recessed, in order to give light to the porter's room in the basement, and it also affords an opportunity for a very satisfactory treatment of attached Ionic columns running through the first and second storeys. The continuation of the bold cornice round the lateral projections has the twofold effect of knitting the building together into one whole and of reducing the apparent height of the attic above.

The two entrance doorways call for no comment; the railings across the front are better worthy of consideration, for they show how

easily a pleasing and highly satisfactory result may be obtained with the simplest of designs. What little ornament there is here is confined entirely to the standards; the railings are to all appearance as "ordinary" as they well can be, yet the whole of this little piece of detail is delightful, and should prove a useful object-lesson to other members of the profession when engaged in designing ironwork.

In order that these notes may be more easily understood, a rough sketch plan of the ground floor is given, which shows the general arrangement of the various offices sufficiently well for our purpose. There are two entrances from the street, one being placed in each of the end projections of the façade. One of these is the public entrance to the banking hall, while the other serves as an entrance to the suite of offices on the first floor, as the entrance to the manager's apartments upon the second and third floors, and also as an additional entrance to the banking premises, which are arranged conveniently and seem to give entire satisfaction. This extra entrance to the bank is safe-guarded by a sturdy mahogany door which is so arranged that it cannot be opened without notice being given to the porter or some other person who is already within the banking department proper. To the right, just inside the outer door, is a lift serving the offices on the first floor and the kitchen upon the third floor. Valuables and heavy cases for the strong-rooms in the basement can only be brought into the building through this entrance, and in order that these may be easily transferred to the lower storey a second lift has been contrived to work through a trap door in the floor of the passage. This trap door is designed to open in two halves, and, the head of the lift being semicircular, the rising of the lift automatically opens the trap and closes it again upon its descent. It is a "trap" in more senses than the one originally intended,

for we dread to think what would be the effect upon the bank official if ever the lift should rise up through the floor while he was passing over the spot.

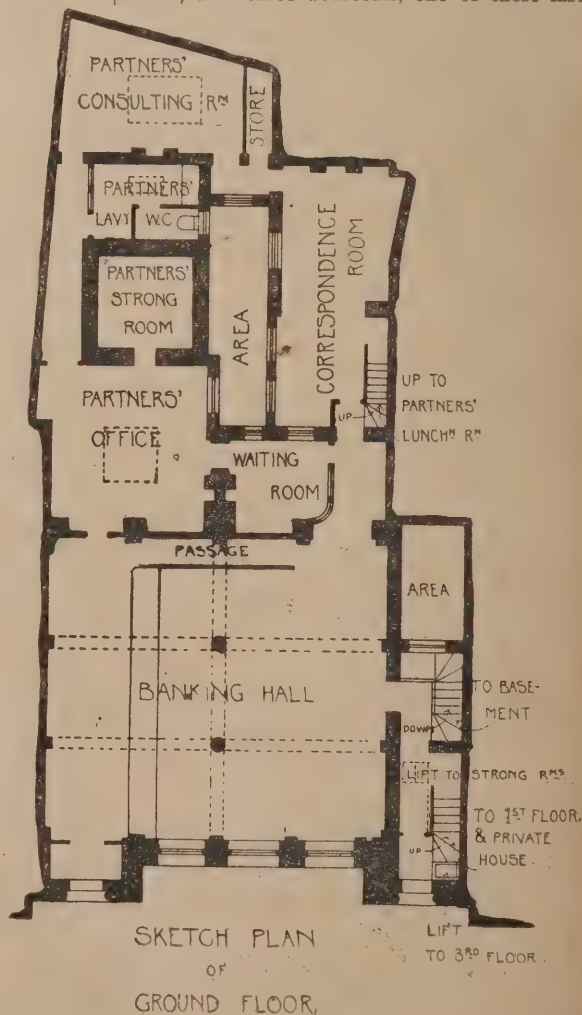

The banking hall is lofty and spacious and the walls are treated with refined arcading. A very good feature is made of the two Ionic columns standing in the centre of the hall and supporting the girders of the floor above. These columns are shown in our illustration. The counter and desk fittings throughout are of polished mahogany, and seem to be eminently well adapted to their various uses. "Steel-bronze" has been substituted for brass in the grille across the paying-desks—a change with which we most cordially agree, both for the sake of appearance and also on the score of saving in labour, for it is claimed for this metal that it never requires cleaning and does not lose its brightness. In appearance it somewhat resembles oxidised silver, and should quickly come largely into use if it fulfils all that is claimed for it. The remainder of this floor is devoted to a "partners' room," with a capacious strong-room adjoining, a consultation room, a correspondence room, a waiting-room, and lavatory accommodation. The dados round the partners' and consultation rooms, though panelled and painted to re-

present mahogany, are only carried out in cement. Some very effective lead glazing is to be found in these rooms, the charm lying not only in the arrangement of the came but also in the judicious introduction of a small proportion of light green fragments among the principal masses of muffled white glass.

The basement is principally devoted to strong-rooms, of which there are eight. The six for the storage of valuables are arranged *en suite*, with one door common to the whole range and an emergency door which can only be approached through one of the ledger strong-rooms. The core of the walling of these impressive treasure-caves consists of blue Staffordshire bricks faced with white glazed bricks, and the whole suite is well ventilated into the open air. There is also a "box-examining room" situate at the entry to the strong-rooms, to which all parcels are taken for purposes of examination and verification before being locked up.

Ascending by the principal staircase from the ground floor to the first storey, we were struck by the poor detail of the iron balusters and could not refrain from comparing them with the well-designed railings only in the street. The first-floor storey extends only over the banking hall and the correspondence room, the rest of the building being covered with a flat roof. The whole of this floor, with the exception of the room above the correspondence room, is to be let as offices or chambers. The room above the correspondence room has been lavishly fitted up and set apart for the use of the partners as their private luncheon room. Their meals will be cooked upstairs upon the third floor by the manager's cook, and can be readily served by a special-service lift down to the landing outside the luncheon-room door. The room is absolutely cut off from the rest of the floor, and is approached by a private staircase rising from near the waiting-room and very conveniently close to the banking hall, as will be seen from the sketch plan.

Two staircases lead up to the second storey, upon which the reception rooms of the manager's apartments are placed. The accommodation here consists of dining-room, drawing-room, and three bedrooms, one of these last

INTERIOR OF BANKING HALL.

being specially reserved and known as the partners' bedroom, in case one of them should have occasion to pass the night upon the premises. The drawing-room contains a very excellent fireplace. Unfortunately the same cannot be said of the dining-room. Because a fireplace was designed, say, a hundred years ago, it does not necessarily follow that its hundred years of existence have transformed it into an object of special beauty; nor does the fact of its antiquity render it absolutely imperative that it should be reused in a prominent position, where, in every probability, it is in striking contrast to its surroundings. Yet here is a flagrant example of the sort: a venerated collection of inlaid white and yellow marbles shaped into a fireplace, with a bas-relief panel representing half a dozen Cupids placed over the opening. May the day be not far distant when the client will put himself as completely and confidently into the hands of his architect as the patient places himself under the care of his doctor!

The third floor contains bedrooms, kitchen, scullery, and the usual adjuncts. In the scullery the arrangement of sink wastes is rather complex, though very excellent. Kitchen, pantry, scullery, and larder are each of them well adapted for their various uses, but it is a distinct fault in the planning that the larder is so far away from all the other offices, there being no fewer than four doors between this room and the kitchen. In the larder, too, is placed the lift which runs up, as shown, from the ground floor.

When we come to consider the building as a whole, and weigh its merits against its demerits, we find there is an overwhelming preponderance on the side of excellence, for the bad points we have touched upon occur, after all, in connection with matters of no very great importance, and were probably to a certain extent beyond the architect's control; but in all else—in design, plan, and fittings—a high standard has been maintained. It can have been no slight task to provide such a large amount of accommodation in the limited space, and to light each apartment efficiently; yet this result has been achieved in every case, and there is not a dark room or passage from ground floor to attic.

THE PAVING OF STREETS.

Opinions of Metropolitan and Provincial Surveyors.

IN view of the issue of a report to the Corporation of the City of London on the "Comparative Durabilities of Wood and Asphalt Pavements," by Mr. D. J. Ross, C.E., the City of London Engineer, and its possible effects on the use of Western Australian timber, a summary of particulars and opinions furnished by the surveyors of a number of London vestries, metropolitan district boards of works, and provincial municipalities, has been issued from the Western Australian Agency, 15 Victoria Street, Westminster, under the instructions of Sir Edward H. Wittenoom, K.C.M.G., Agent-General for Western Australia.

In the course of his report, Mr. Ross stated that all the streets (15) in the City paved with Australian hardwood were in "good" or "fair" condition, with the exception of two only—Queen Street, laid in 1893 and 1899, and Upper Thames Street (Queen Street to Peter's Hill), laid in 1896. Mr. Ross further says: "The most notable instances which had come under my observation of hardwood pavements not having worn satisfactorily

experience and observations, therefore, in regard to the suitability of hardwood paving and to the best methods of laying the wood will be of interest. He lays his blocks with joints, in which he places small deal laths, the joints then being carefully grouted with pitch. By this means the expansion and contraction of the wood are provided against. In no case, the surveyor says, has the expansion of the blocks given him any trouble by the displacement of kerbs and footways, as so frequently occurs where cement grouting is used. Exceptional contraction is corrected by running in the joints affected with pitch. The durability of hardwood paving in this district is unquestionable, and, in view of the traffic in Euston Road and other great thoroughfares, its suitability for streets with heavy traffic, when well laid and carefully supervised after laying, is clearly demonstrated.

St. Paul's Road, Canonbury, was laid with Jarrah in 1894. The blocks were put on a 7in. concrete bed, without floating, as, in the opinion of the surveyor, Mr. J. Patten Barber, M.Inst.C.E., the concrete in this instance did not require it. The method of laying adopted by Mr. Barber differs from that of Mr. Blair of St. Pancras, and is more in accordance with the usual custom. He dips his blocks in pitch and close-joints them, grouting with pitch. He corrects the expansion and contraction of the wood by careful supervision after laying. The expansion joints adjoining the kerb are carefully watched, and when they are becoming nearly closed, but before the blocks begin to press on the kerb the expansion joint is widened. In this way, no kerb has been pushed out of place by the expansion of the wood in this district. As soon as the blocks show signs of contraction they are carefully watered, so as to prevent the joints opening and the blocks becoming loose. Occasionally the roads are drenched with water at night, which not only helps to prevent contraction but cleanses the roads.

In Regent Street (which was laid in 1897) and Piccadilly (laid in 1896) the wood has evidently shrunk and swelled, so that the

were in Tottenham Court Road and St. Paul's Road, Canonbury." He also mentions "other streets in the metropolis laid with hardwood which were in anything but a satisfactory condition—Regent Street, Pall Mall, Piccadilly, Shaftesbury Avenue, and Rosebery Avenue"—and says that he had been "informed by Mr. Weaver, the surveyor to the Kensington Vestry, that in his district the hardwood was being removed and deal blocks substituted for it."

The streets named by Mr. Ross have been inspected, and the surveyors of the districts in which they are situated have been interviewed.

With regard to Tottenham Court Road Mr. W. N. Blair, M.Inst.C.E., says that the material supplied was not quite satisfactory, as many of the blocks were not true to gauge. They were described in the contract as "cut from the deals as imported," and in thickness they varied as much as three-quarters of an inch; consequently it was impossible to lay an even pavement. The condition of the road, after eight years' wear, is certainly not good, as, through the crowning or buckling of the blocks, it has become very rough and "corduroy" in its character. Since 1892 Mr. Blair has laid many thousands of yards of Jarrah and Karri wood in his district, and the result of his

IRON RAILINGS AT MESSRS. BARCLAY'S NEW BANK PREMISES, FLEET STREET.

courses have become irregular, resulting in an uneven surface, and in the loosening of many of the blocks. In Shaftesbury Avenue (laid in 1897) the objection arises partly from the roughening of the wood, but in Pall Mall East (laid in 1896) it clearly arises from the unusual shrinkage of the blocks. In each of these cases there is certainly good ground for complaint. But it should be noted that while the wood used is Karri only, Jarrah—and, indeed, every wood—is subject in a measure to the same conditions.

The portion of hardwood paving in Rosebery Avenue to which Mr. Ross refers was laid in 1896. The wood used was Jarrah and it was laid with a cement grout. Mr. P. G. Killick, the surveyor, says: "In dry weather the blocks have got rather loose; the courses have also become rather irregular in places. I do not consider cement grouting suitable for hardwood paving. Spencer Street was paved with pitch grout in August, 1895, and I have not had to spend a penny in repairs. We have just paved the second portion of Rosebery Avenue with Jarrah wood, close joint, hand dipped, and pitch and tar grout, area about 4,000 yds., and are about to pave Lower Charles Street, 1,150 yds., and Percival Street, 2,150 yds., with similar wood and grouting."

Karri is the wood used in four of the seven streets to which Mr. Ross refers, and the chief objection to this wood in Regent Street, Piccadilly, and Pall Mall arises from its liability to expansion and contraction—a satisfactory, if not complete, remedy for which may be found in an efficient and proper system of laying, and in careful supervision after laying. So far as the durability of hardwood for paving purposes is concerned, the examples cited do not bear out Mr. Ross's contention that "this class of pavement is not of that durable nature anticipated."

Comparison between Wood and Asphalt.

The scope of this enquiry was limited to the question of the durability of Western Australian hardwoods. The matter, therefore, of asphalt paving has not been gone into in detail. At the same time, during the pursuit of the enquiry, a good many opinions have been expressed and some facts adduced on the subject. It was found, indeed, not only from the surveyors whose districts were mentioned by Mr. Ross, but from others, that there is a large body of opinion against the use of asphalt as compared with wood. "I would prefer soft wood to asphalt for the heaviest traffic," said one surveyor, speaking of one of the most important and thronged districts in London. "I would not lay asphalt in my heavy thoroughfares," said another surveyor, a man of light and leading in his profession, "if they were to give it to me for nothing."

Asphalt paving has two special advantages: firstly, it can be cleansed rapidly and easily; and, secondly, it can be repaired quickly and with fair uniformity.

But some contend that it is a cruel paving for horses, and that wood affords a far safer and quieter road, and if kept properly cleansed is little less sanitary than asphalt.

London Surveyors' Opinions.

The following particulars and opinions on the use of hardwood paving have been compiled from the surveyors connected with various London vestries, metropolitan boards of works, and provincial municipalities.

Battersea.—The surveyor, Mr. J. T. Pilditch, M.Inst.C.E., has used Jarrah and Karri extensively, and is pleased with both woods. He is very particular in laying the blocks, which he cuts himself. He has a considerable amount of hardwood paving in hand.

Bermondsey.—The surveyor, Mr. R. J. Angel, A.M.Inst.C.E., says that his vestry formerly used Blue Gum for paving, but were compelled to take the blocks up. They are now using Jarrah, and are so satisfied with the result that they are proposing to use still larger quantities.

Bethnal Green.—The surveyor, Mr. F. W. Barratt, F.S.I., is about to lay a considerable quantity of hardwood. He thinks that very much of the success of the paving depends upon the method of laying the blocks, and upon the blocks being true to gauge.

Camberwell.—The surveyor, Mr. W. Oxtoby, A.M.Inst.C.E., has given the question of hardwood paving considerable attention, and is strongly in favour of it. A large quantity is being laid by his vestry.

Clerkenwell.—Jarrah has been used by this vestry for five years with, in the main, very satisfactory results.

Hackney.—The surveyor, Mr. Norman Scorgie, A.M.Inst.C.E., has had some experience of hardwood paving in other districts, and is particularly favourable to Karri. He keeps his roads well sanded and has had no complaints as to slipperiness.

Hammersmith.—This vestry has been using Jarrah for the past nine years. At first the surveyor, Mr. H. Mair, M.Inst.C.E., laid the blocks with open joints and cement grout. Now he lays the blocks close and grouts with pitch. Hammersmith Road was laid in 1892 with open joints and is very rough. But the wear has been so little, comparatively, that it is probable the blocks will be turned and used again.

Hampstead.—This vestry laid some Jarrah paving seven or eight years ago. The surveyor, Mr. C. H. Lowe, M.Inst.C.E., had occasion to take up some blocks of Jarrah and of creosoted deal laid in the same street and subject to the same traffic. After seven years' wear the Jarrah had worn $\frac{1}{2}$ in. and the deal $2\frac{1}{2}$ in. The old Jarrah blocks were sold to a contractor for paving a stable yard. Mr. Lowe lays his blocks with $\frac{3}{4}$ in. joints, in which small strips of lath are placed, and grouts with pitch.

Kensington.—The surveyor, Mr. W. Weaver, C.E., has tried Jarrah, but is in favour of creosoted yellow deal. He lays the wood on a bed of 6 in. concrete, floated 1 in 4. The blocks are grouted with pitch.

Lambeth.—This vestry was the first to use Jarrah for paving purposes in London, and its experience has been uniformly satisfactory. The present surveyor, Mr. H. O. J. Edwards, M.Inst.C.E., is of opinion that Jarrah is the best paving wood, provided that it be properly prepared and well laid. He has not had much experience with Karri. He thinks that the timber companies might grade their woods. He cuts his own blocks, lays them close, dips them in pitch, and grouts with cement. Mr. Edwards says that objections are raised by butchers and fishmongers to the method of pouring pitch on the surface of the blocks, as the blue dust which rises from the pitch when dry injuriously affects their trade.

Limchouse.—This vestry has used hardwood paving for two to three years, and, according to the surveyor, Mr. Thomas H. Dunch, M.Inst.C.E., is quite satisfied with it. A large contract has been recently let for laying Jarrah in Commercial Road, E., and in East India and West India Docks Roads.

Marylebone.—This vestry prefers soft wood for paving, but the surveyor, Mr. J. Paget Waddington, C.E., thinks that hardwood, well laid, makes a better and certainly a more durable pavement.

Middlesex.—The surveyor, Mr. H. Heckford, C.E., says that his vestry began laying Jarrah blocks about eighteen months ago, and is, so far, extremely satisfied with the result.

St. George the Martyr, Borough Road.—Mr. A. Harrison, M.Inst.C.E., the surveyor, says that his vestry has laid a large number of Jarrah blocks during the past six years, and they have given every satisfaction. In the case of a soft wood contract in his district, made in 1885, the wood has had to be renewed every five years. As soon as the contemplated arrangements for the new London municipalities are completed, he anticipates there will be a considerable increase in the amount of hardwood paving used. At present his vestry, and doubtless others, are waiting for the readjustment of their boundaries.

St. Giles, Holborn.—Mr. G. Wallace, F.S.I., who is the doyen of London surveyors, has examined and tested all kinds of paving woods, and will, it is hoped, soon publish the result of his investigations. He is in favour of asphalt for level streets with heavy traffic, but for moderate gradients he prefers hardwood. He is of opinion that if hardwoods can be supplied at a price that will at all enable them to com-

pete with soft, they will certainly command the market.

Stoke Newington.—The surveyor, Mr. Reginald Brown, A.M.Inst.C.E., has used a considerable quantity of Jarrah in his district and is extremely particular in regard to the gauge and character of the blocks. He is, so far, thoroughly satisfied with the result. He thinks the woods might be graded for different classes of traffic.

Strand.—Mr. A. Ventris, C.E., the surveyor, favours soft wood. He has known it wear for twelve-and-a-half years. He is of opinion that suitable wood well laid will last as long as any granite that is soft enough for paving. He regards the question of foundation as a very important one. The concrete laid in the Strand is between 12 in. and 24 in. deep. He has had some Queensland hardwood in use at the top of Bow Street for the last four years, and it appears to be wearing well. Mr. Ventris thinks that the secret of successful wood paving is good material, efficient laying, and thorough scavenging.

Whitechapel.—Mr. M. W. Jameson, C.E., the surveyor, says that some hardwood was laid in 1894, and he is quite satisfied with the result—so much so, that there is a strong feeling in favour of more extensive use. The traffic in the Whitechapel streets is very heavy.

What Provincial Municipalities think.

Aberdeen.—There is clearly a need for wood pavement in the main streets of the Granite City, as the noise of the traffic is very great. The city engineer, Mr. Dyack, has laid a small section of Jarrah near the City Hall which has given every satisfaction. He is strongly in favour of adopting wood in the leading business thoroughfares.

Barrow-in-Furness.—The surveyor, Mr. Fox, showed a section of hardwood paving (beech) laid by him in 1885 on the bridge leading to the docks. The Railway Company laid some soft wood on another part of the same bridge in the same year, which has had to be renewed six times.

Belfast.—It was the intention of the Corporation to use hardwood some time ago, but the price, at the time, was prohibitive. The use of wood pavement in the main streets of this city is felt by many to be a growing necessity.

Blackburn.—The streets of this town are exceedingly well kept. The borough engineer, Mr. Stubbs, has laid a considerable quantity of Jarrah wood during the last two years and is well satisfied with the results.

Bolton.—Some creosoted beech blocks have been laid by the Corporation, but complaints have been made of their slipperiness. It is said that the horses of Lancashire towns are not suitably shod for wood pavements.

Brighton.—The Corporation has laid a number of streets with Jarrah during the past two-and-a-half years, and the surveyor, Mr. May, is very well satisfied with the result. He lays his blocks dry and grouts with pitch.

Bristol.—In 1895 the city engineer, Mr. Thomas Henry Yabbicom, A.M.Inst.C.E., submitted a report to the Corporation, strongly recommending the use of hardwood paving. Since that time a large quantity of Jarrah and Karri has been laid in the streets of that city, and has given general satisfaction.

Bury.—The surveyor, Mr. Cartwright, hopes that his Council will favourably entertain the proposal to introduce wood paving into Bury.

Canterbury.—About eighteen months ago some 4 in. Jarrah blocks were laid in this city. From the appearance of the street and according to the opinion of the assistant surveyor, Mr. Dore, the wood appears to be wearing well.

Cheltenham.—The surveyor, Mr. Hall, considers that Jarrah is too good to be used for paving. He, however, proposes to try a section at a favourable opportunity. The streets of this fashionable spa would certainly be the better for the introduction of wood in the place of macadam.

Derby.—The Corporation is about to try tar macadam, and is not, at present, in favour of wood.

Devonbury.—Hardwood paving has been in use in this town during the last eighteen months, and the surveyor, Mr. Dearden, is, so far, fully

satisfied with the result. It was laid with open joints, with strips of lath inserted, grouted with pitch.

Dover.—The Corporation has been using Jarrah for the past four years. There is a considerable quantity of 4in. blocks being laid in connection with the extension of the electric traction system. The borough engineer, Mr. Stillgo, is of opinion that blocks 7in. or 8in. in length would do as well as 9in. He is strongly in favour of wood paving.

Dundee.—The streets of this city, as in Aberdeen, urgently need to be paved with wood. Two of the main thoroughfares are about to be laid with hardwood in connection with the electric trams. The city engineer, Mr. Mackison, and Mr. Longayr, chairman of the Roads Committee, are very desirous of giving Western Australian hardwood a trial.

Eastbourne.—The borough engineer, Mr. Gloyne, is desirous of introducing the use of hardwood paving, as he thinks it will be a great improvement to the streets and roads of this thriving seaside resort.

Folkestone.—Some hardwood paving has been laid by the Corporation and has given satisfaction. But the gradients are too heavy for an extensive use of the system. The surveyor, Mr. Nichols, thinks highly of Jarrah.

Gloucester.—The Corporation is likely to use a large quantity of hardwood in connection with the extension of its electric tram system.

Goole.—It is intended, shortly, to lay one or more streets in this town with Jarrah.

Harrogate.—The surveyor, Mr. Stead, tried a section of Karri, but found that the expansion was very great. The main objection, however, to the use of hardwood paving by his Council arises from the expense. Tar macadam is thought to be sufficient for the comparatively light traffic, while it is considerably cheaper.

Hastings.—The Corporation has been using hardwood paving for the last four years. The surveyor, Mr. Palmer, lays with close joints and is well satisfied with the wood. He is laying 4in. blocks.

Lancaster.—The surveyor, Mr. Cook, tried to obtain Jarrah in 1898, but found he could not then rely upon a continuous supply. He has used Scotch beech blocks, but would prefer to use Western Australian hardwood. He will probably do so when further wood paving is required.

Leeds.—A considerable quantity of Jarrah blocks has recently been laid. Mr. Prince, the highway surveyor, is in favour of hardwood paving, so far as his experience goes. He thinks that 7in. or 8in. blocks would probably suit streets with heavy traffic as well as, if not better than, 9in.

Leicester.—The surveyor, Mr. Mawbie, has laid both Jarrah and Karri, with very satisfactory results. He has tried various systems of laying. Further and considerable extension in the use of Western Australian hardwood paving is anticipated.

Llanelli.—The streets of this growing and progressive town sadly need improvement. The surveyor, Mr. Watkins, and the chairman of the District Council, Mr. Trubshaw, will beglad to introduce wood paving.

Luton.—The same may be said of the streets of Luton. The surveyor, Mr. Evans, says that a little hardwood is used at a few of the crossings, but more is needed.

Manchester.—Various trials of hardwood have been made in this city, with, apparently, unsatisfactory results. It is said that the atmospheric conditions, the heavy traffic, and the local method of horse-shoeing are against the use of wood paving. It is found, however, that the streets which had been laid with wood do not appear to be well scavenged; and, in view of the necessity of this being done, the opinion is expressed that the test has not been so complete as it might have been.

Middlesbrough.—At present tar macadam, composed of local slag, is largely used in the streets of this town. But, owing to the heavy traffic, the result cannot be regarded as satisfactory. Enquiries have recently been made as to hardwoods, and the surveyor, Mr. Baker, will be glad to make a trial of Jarrah or Karri.

Penzance.—The surveyor, Mr. Latham (nephew of Mr. Baldwin Latham), who has recently come from Margate, speaks highly of

Jarrah. A section which has been laid in one of the streets of Penzance is giving every satisfaction.

Preston.—The surveyor, Mr. Cookson, is not in favour of wood paving. He has similar objections to those of Manchester. He has tried some special paving bricks, holed for and filled with wood, but the result is unsatisfactory.

Southampton.—Large quantities of Karri blocks are being laid in this town in connection with the electric tram system. The surveyor, Mr. Bennett, favours 5in. blocks, laid with $\frac{1}{2}$ in. joints.

Sunderland.—Jarrah is used at a few crossings. The surveyor, Mr. Moncur, says that he has had complaints about the slipperiness of the wood, but he thinks if it were more generally used the objection would disappear.

Swansea.—The streets of this town, like those of Llanelli, would be greatly improved by the introduction of wood paving. The surveyor, Mr. Bell, would be glad were his Council to take the matter into their favourable consideration.

Wakefield.—A considerable amount of hardwood paving has been laid in this city, and with very satisfactory results.

Worcester.—About two-and-a-half years ago a section was laid with Jarrah, and some Scotch beech blocks were also tried. The latter are wearing badly but the former are giving satisfaction, and the surveyor, Mr. Caink, hopes that when the electric tram system is adopted in the city the use of Western Australian hardwood will be considerably extended.

There are many provincial towns, other than the above, which have used, and are using, Western Australian hardwood, and from which the testimony is equally favourable to hardwood paving. Among these are the following:—Accrington, Barnsley, Bath, Birmingham, Blackpool, Bradford, Brentford, Brixton, Chester, Glasgow, Hartlepool (W.), Harwich, Hereford, Huddersfield, Hull, Ipswich, Liverpool, Londonderry, Loughborough, Newcastle-upon-Tyne, Norwich, Nottingham, Oldham, Peterborough, Plymouth, Ramsgate, Romford, Sheffield, Southend, Taunton, Wokingham, Worthing, Yarmouth, and York.

Summary.

Methods of Laying.—In a large number of instances the blocks are laid close, dipped in pitch, and grouted with pitch. By pitch is usually meant a composition of pitch and tar. In some cases one side and one end of each block are dipped, and in others the bottom half of the block is dipped. Some excellent results have been secured by laying the blocks dry and carefully grouting with pitch, and by dipping in pitch and grouting with cement and sand. The borough surveyor of Leicester, Mr. Mawbie, tried four methods of laying—(1) with $\frac{1}{2}$ in. joint, (2) with $\frac{3}{4}$ in. joint, (3) with close joint—all grouted with cement and sand—and (4) with close joint grouted with pitch. He states that he finds the last to be much the best method.

Size of Blocks.—Some surveyors believe that a better pavement would be made with blocks 7in. or 8in. in length than with the customary 9in., as the camber of the road would be better preserved and the blocks be kept more even. Opinions vary considerably as to the depth of the blocks. Many surveyors who formerly used 5in. or even 6in. are now using $4\frac{1}{2}$ in. and some 4in. It is thought by some, however, that a depth of 4in. does not afford a sufficient "key."

Buckling of the Blocks.—It is considered that the crowning or buckling of the blocks is largely due to the difficulty of making and keeping an even pavement, the remedy for which lies, mainly, in efficient laying and in careful supervision.

Slipperiness of the Blocks.—It is found that when the blocks are kept clean and, in bad weather, are carefully sanded, there is very little cause of complaint as to their slipperiness.

Soft Wood versus Hard.—It is stated that, for paving purposes, soft wood has an advantage over hard, because it affords a better foothold for horses, and makes, on account of its "burr," a more even pavement. But it is universally acknowledged that among the advantages which hardwood possesses compared with soft are the following:—(1) It is more durable,

(2) it absorbs less moisture and dries more quickly, (3) it is, therefore, less slippery, especially when the soft wood becomes greasy, (4) it gives off less dust in dry weather, (5) its sanitary character (a matter of great importance) is, in consequence, far superior, and (6) it is less costly to keep clean.

General Conclusions.—The particulars given in this report and the general evidence on the subject prove that, in the judgment of a very large number of experienced surveyors, Western Australian hardwood blocks, well cut, true to gauge, laid on an efficient system, and carefully supervised, both during and after laying, constitute for city and suburban thoroughfares a very excellent paving.

THE HELLENIC SOCIETY.

THE annual meeting of the Hellenic Society was held on Thursday last, in the rooms of the Society of Antiquaries.

The President, Sir Richard Jebb, M.P., said the year had been marked by several events of interest in relation to Hellenic studies. At Phylakopi the British School had been completing its excavations, and the results would shortly be published in a special supplement to the "Journal of Hellenic Studies." The British Museum had published the volume describing the excavations at various sites in Cyprus, of which the most important was Enkomi. The Germans had been digging at Miletus, and the Austrians had been conducting excavations at Ephesus. But the most interesting and important result of the year in the field of early Hellenic archaeology was represented by the discoveries made by Mr. Arthur Evans in Crete.

Sir William Richmond said that the other day at a dinner a gentleman had given him £250 for the work in Crete, and if the Society would pay for his journeys there and back he would gladly go himself to Crete to take copies of the wall paintings and to do his best to preserve what remained.

Mr. Arthur Evans said that last year a fund for exploration in Crete was started; but only a small amount was raised. Mr. Hogarth, who was with him, had done good work. Mr. Evans then described in detail the excavations of a large palace—including the propylea. Digging down seven metres he had come to traces of neolithic deposits, and it seemed that there was a great superimposition of the works of a much later civilisation. In a succession of large magazines great jars resting on pavements were discovered. Underneath were two stone cists lined with lead at two depths. He was thus led to the conclusion that treasures would be discovered at a still greater depth. There were traces of a great catastrophe at an early age, and the whole site—though at the time of the destruction the buildings were plundered—had from that time been left undisturbed. The most interesting part was at the north-east, where frescoes were discovered as fresh as those of Pompeii, from which, however, they were separated by about fourteen centuries. Here there was what might have been a council chamber or throne room of perhaps unparalleled antiquity. On other walls were frescoes of flowers, water plants, running water and fishes. There was also a part of a Mycenaean shrine—with fresh colouring—like one discovered by Schliemann. Beyond these rooms were the northern propylea with the remains of a great bull, of which the head and a large part of the body were brought out—suggesting the Minotaur. Other artistic remains disclosed a picturesque style not hitherto associated with that remote period. Funds were needed, and he was glad to hear Sir William Richmond's announcement; he had had to bear the brunt himself, and would be thankful for help.

Competition for Proposed Bridge across Sydney Harbour.—The time for receiving designs and tenders for this bridge has been extended from August 1st to noon on September 1st next both for London and Sydney. Particulars of the competition will be found on p. 56 of our issue for February 28th last.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Buildings around Bradford.

BRADFORD.—STUDENT writes: "I should be very glad if you could give me the names of a few domesticated (*sic*) buildings within an easy radius of Bradford that are worth measuring."

We are always willing to help our correspondents as much as we possibly can, but we hardly think it devolves on us to tell persons living in Bradford the names of "domesticated" buildings in and around that city. We must therefore ask our querist to apply to someone a little nearer home.

A Question about Varnished Wallpapers.

LONDON, S.W.—A.R.I.B.A. writes: "I specified in a house-repairing job that the walls should be stripped and repapered at so much the piece. The builder has stripped all the walls excepting those covered with a varnished paper, which he says will require potash for its removal, and even then will bring off the setting coat from the plaster. Is this a reasonable excuse, or should I insist on the specification being carried out? What is the custom in the trade?"

We have never heard of the plaster trouble before, though the paper will undoubtedly be more difficult to remove than an ordinary unvarnished one. If you wish the paper to be removed you can insist on its being stripped. Hot soda-water will be required and care must be taken to protect the skirtings and frames.

Power of District Council to Refuse to Pass Plans.

NORWICH.—A. J. writes: "Plans of new houses on a small estate have been submitted to a district council for approval. All roads are drawn, and are admitted by the council's surveyor to be of the required width. The council, however, refuse to pass the plans until the roads are actually made. Can they legally do this? The construction of the new roads will necessitate the pulling down of paying buildings, and as the estate may develop slowly it is desired to leave these up as long as possible."

Section 158 of the Public Health Act, 1875, provides that where notices and plans of intended works are required by any by-law of an urban authority to be laid before that authority, the authority shall, within one month after such notices and plans have been delivered or sent to their surveyor or clerk, signify in writing their approval or disapproval of the intended work to the person proposing to execute it. The above-named section applies in all urban districts, and in rural districts where Part III. of the Public Health Act Amendment Act, 1890, has been adopted or has been put in force by order of the Local Government Board. "A. J." should ascertain if the said section applies in his case. If so, the authority cannot prevent his proceeding with the work after the period for approving or disapproving the plans has elapsed.

G.H.B.

Devonshire Building Stones.

LABORE ET PERSEVERANTIA writes: "Which would be the best and cheapest stone to use for a church building in Devonshire? Which would look the better—bricks with stone dressings or granite with stone dressings?"

Devonshire being a large county any remarks which would perhaps apply at, say, Plymouth would be rather misleading perhaps at, say, Barnstaple. Taking the county generally, I

should say you cannot do better than use the local ragstone as facings to your walls. This may be used rock-faced or axed and laid in random or drop courses; it would probably cost less than brickwork in Devonshire. The cheapest kinds of stone for external dressings would be Monk's Park Bath stone or Ham Hill stone. Monk's Park would be the cheaper and can be obtained ready worked to detail from the Bath Stone Firms, Bath. Ham Hill stone can be obtained from Messrs. Trask, of Norton, Somerset, also ready worked. The objection to Ham Hill stone is the delay invariably experienced in getting delivery. In point of colour it is to be preferred to the Monk's Park. I should recommend the use of granite for copings and plinths. The granite is a grey colour, somewhat similar to Perth, but usually of a larger grain. In some parts granite might be obtained for less than Ham Hill stone if the details are plain. There is a local stone known as Polyphant, which might be used internally in conjunction with Corsham Bath stone. Polyphant can be obtained ready worked from Mr. Nicholls, Polyphant, Launceston. I should not recommend the use of brick for your work. Get samples of ragstone and granite dressed in various ways, and prices, from some Plymouth and Exeter masons or builders.

G. H. J.

The Projection of Shadows.

LOUGHBOROUGH.—STUDENT writes: "What are the names and prices of the best books on the subject of casting shadows on perspective drawings?"

The best books are: "Sciagraphy, or Parallel and Radial Projection of Shadows," by R. Pratt, price 6s. post free from Mr. B. T. Batsford, 94 High Holborn, W.C., and "Gwilt on Shadows" (1833), price 4s. 6d., post free.

Public Electric Lighting.

ELGIN, N.E.—ARCHITECT writes: "What publication would most readily give an amateur a general knowledge of the technical terms contained in an expert's report on electric lighting, or what text-book would you recommend for reading up this subject in connection with a public scheme?"

Read "Electric Light: its Production and Use," by J. W. Urquhart, price 6s., and "Electrical Installations," by F. J. Warden Stevens, A.M.I.C.E., price 2s. 6d. Both these books are obtainable from Mr. B. T. Batsford, 94 High Holborn, W.C. The second-named book is particularly intended for the use of architects, borough surveyors, &c.

Books on Architectural Ornament.

RICHMOND.—T. H. S. writes: "Please name two or three good works on the ornament of the various architectural styles."

"A Handbook of Ornament," by F. S. Meyer, revised by Hugh Stannus F.R.I.B.A., price 10s.; "A Manual of Historic Ornament," by Richard Glazier, A.R.I.B.A., price 5s. net. These two books, which are the best on the subject for students' use, can be obtained from Mr. B. T. Batsford, 94 High Holborn, W.C.

Borough Surveyorships.

HAWICK.—STUDENT writes: "I am an architectural draughtsman, and have been called to fill a temporary situation in a borough and county surveyor's office in a provincial town. I shall be glad if you can advise me how I can best further my knowledge of the duties connected with the carrying out, or superintending of, the various classes of work in connection with such a position. I refer more to what I can learn by study rather than by observation or experience. If you know of any books on drainage schemes, or such other works as you think may come under my curriculum, kindly mention them."

The best book our correspondent can have is the "Municipal and Sanitary Engineers' Handbook," by H. Percy Boulnois, third edition, price 12s. It comprises the whole duties of a borough surveyor. Mr. B. T. Batsford, 94 High Holborn, W.C., will supply it.

The "Berliner Architekturwelt."

HEATON.—J. L. writes: "Where can I obtain a specimen copy of the 'Berliner Architekturwelt,' recently reviewed in your columns?"

The architectural paper in question is published by Ernst Wasmuth, Markgrafenstrasse 35, Berlin, W., 8. The yearly subscription for foreign subscribers is 24 marks (24 shillings); the issue is monthly. We do not know whether single copies are obtainable, but this could be ascertained by writing to the publisher.

London Clubs.

LIVERPOOL, J. W. F. writes: "Please say what club-houses—social and political—have been built in London within, say, the last ten years. Which clubs of the old established ones are considered the most perfect from an architectural point of view?"

We do not think that any club of importance has been erected in London within the last ten years: the Junior Constitutional Club in Piccadilly is probably the latest. The Athenæum Club in Pall Mall is a fine building, though it has not been improved by the storey recently added. It was designed by Decimus Burton, and was completed in 1829 at a cost of £351,000. It has on the front a frieze reproduced from the fragments of the frieze of the Parthenon now in the British Museum, and over the doorway there is a large figure of Minerva, by Bailey. The Reform Club, also in Pall Mall, is a successful copy (by Sir Charles Barry, 1795-1860) of the Farnese Palace at Rome. A little farther on is the Carlton Club, originally built in the Grecian style from designs by Sir R. Smirke, but almost entirely reconstructed in 1847 by his brother Sydney, who took the library of St. Mark's, Venice, as a model. The façade is 130ft. long and has a double row of pillars of Peterhead granite. The Travellers' Club, adjoining the Athenæum, is Italian in style, and was built in 1832 from designs by Sir Charles Barry. At a corner of Waterloo Place stands the United Service Club, built in 1823 from Nash's designs. It has a Roman Doric portico with Corinthian columns supporting a massive pediment. The Palazzo Cornaro and St. Mark's library furnished models for the Army and Navy Club at the corner of George Street. The Conservative Club in St. James's Street is in the Palladian style and was erected in 1849 on the site of the "Old Thatched House Tavern." Sydney Smirke and George Basavi were the architects. A description of the Constitutional Club in Northumberland Avenue (the National Liberal is also *clo e by*), by R. W. Edis, will be found on pp. 72 and 74 of our issue for September 6th, 1899, and a small illustration of it in the issue for September 20th.

Remuneration and Old Materials.

HALIFAX.—FAIRATION (as far as we can make out) writes:—"When the terms are arranged on the basis of a percentage on the outlay, is not the architect entitled to reckon his commission upon the total cost of the works (valued as if erected by a builder) and of new materials, according to the Institute schedule? The legal adviser to my client says that the value of old materials must not be reckoned."

This postcard is practically illegible. I understand, however, that the question is whether, when the terms arranged between architect and client are that the architect is to be remunerated by a commission on the outlay, the commission is to be calculated on the total cost of the works valued as if executed by a builder and of new materials. I do not think so. I think if old materials are used their value must be taken into account as old materials and not as new materials. If these happen to belong to the building owner, their use in the building costs him as much as he could get for them; if they do not belong to him, they cost him as much as he has to pay for them.

H. P. B.

[We shall feel obliged if "Fairation" will in future write less in the manner of the Lord's Prayer crowded on a threepenny piece. Querists should always try to make their statements as concise as possible, and should not include (as they often do) a lot of extraneous matter.—ED.]

THE BANISTER FLETCHER BURSARY.

THIS Bursary, of the value of twenty-five guineas, is founded for the promotion of the study of London architecture of the last two centuries since the Fire, and for the preservation of records of buildings likely to be destroyed.

It will be awarded to any member of the profession (including non-members of the Architectural Association), without limit of age, who shall submit the best selection of measured drawings, not necessarily prepared for the purpose of this Bursary, together with a short descriptive report of the buildings to which they refer, and accompanied by three testimonials. The drawings, report, and testimonials must be delivered addressed to the hon. secretaries of the Architectural Association, 56 Great Marlborough Street, W., before 1 P.M. on Saturday, July 28th, 1900. No award will be made if the drawings are not of sufficient merit.

The successful candidate will be required to prepare a set of accurate measured drawings of one of the buildings of the prescribed period to be selected for study. He will be at liberty to suggest his own subject, under the sanction of the prizes sub-committee, with whom the decision as to the building to be studied in each year will rest. All the drawings must be executed in black ink and be delivered flat, and are to consist of plans, sections, and elevations to $\frac{1}{2}$ in. scale with $\frac{1}{4}$ in. and full-size details, and a perspective sketch. The rough sketches and measurements made upon the spot are to be also submitted. A descriptive report upon the building must accompany the drawings, dealing with historical facts and special features of its construction, materials, planning, &c.

The committee is to have the right to publish all or any of the drawings and the report.

Very accurate drawings will be required, the object being to obtain as complete a monograph of the selected building as possible, and in a form as far as possible that of a series of such records. Ten pounds will be paid on the award being made, and the balance upon the successful candidate's work being approved by the Prizes Committee.

As a guide to candidates a few of the many interesting works of the last two centuries may be mentioned as follows:—*Wren*: Westminster Dormitory; Christ's Hospital, old portion; a City Church; Morden College, Blackheath; Kensington Palace. *Hawksmoor*: St. George's in the East. *Vanbrugh*: Greenwich Church. *Varley*: Spenser House. *Earl of Burlington*: Alpine Club; General Wade's House. *Dance*: Newgate Prison. *Samuel Ware*: Burlington Arcade. *Ripley*: Admiralty Board Room. *Adam*: Sion House; Adelphi, interior work; Stratford Place. *Sir Robert Taylor*: Pelican Offices; Ely House. *Sir W. Chambers*: Somerset House; Kew. *Holland*: Dover House; Brooks Club. *Wyatt*: Stafford House. *Burton*: Hyde Park Screen; Villas, Regent's Park. *Sir John Soane*: Museum; Bank; Dulwich Galleries. *Hardwicke*: Great Hall, Euston Station. *Sir Charles Barry*: Clubs; Keyham Dockyard; Entrances, Pentonville Prison. *Cockerell*: Work at Bank of England. *Pennythorne*: London University. *Unknown Architects of the period*: Old houses of city merchants in neighbourhood of London.

The lesser-known subjects not hitherto published may also be recommended to the attention of candidates. Interesting street façades and houses will be found still remaining, as in Soho Square, Great Portland Place, &c. Any candidate aware of such examples, or the existence of special facilities in respect of any particular work of the period is invited to give particulars of the same, accompanied, if possible, by photographs, in sending in his application.

A Marble Memorial in St. Patrick's Church, Wapping, has been erected by Mr. Henry Price, of Chelsea, to the memory of the late Charles Willcock Dawes and his wife, founders and benefactors of the church.

KING'S COLLEGE, LONDON.

PRIZE LIST.

ON July 3rd Professor Dicey, LL D., distributed the prizes and certificates gained by students at King's College.

In the division of Engineering, Architecture, and Applied Science of the Faculty of Science the following have been recommended for the Associateship:—L. C. Benton, W. A. P. Brookes, D. R. H. Browne, G. H. Lovegrove, W. Marden, L. G. Nunes, J. D. Plumpton.

Scholarships and Exhibitions.—Sambrooke: W. J. Marlow; Engineering Entrance: W. J. Marlow, A. H. Imber, and W. A. Sadgrove; given by the Clothworkers' Company, Science Exhibition (Senior): P. C. Kingsbury.

Carpenters' Company Prizes.—Architectural History (3rd year)—Gold medal and prize of £3 in books, Harry Prince. Silver medal and prize of £2 in books, G. H. Lovegrove. Architecture and Building Construction—Silver medal and prize of £2 in books (2nd year), J. R. P. Rowley. Bronze medal and prize of £1 in books (2nd year), R. W. Edwards. Silver medal and prize of £2 in books (1st year), W. J. Marlow. Bronze medal and prize of £1 in books (1st year), O. C. Thompson. Building Construction—Professor's prizes for best note books, first, second, and third years, not yet awarded. Architectural History (3rd year)—Professor's prize not yet awarded.

Mr. C. S. Campbell won one of the Engineering Society's prizes for a paper on sewerage and sewage disposal works at Hampton.

Certificates:—Building Construction (3rd year), N. A. Leech (Occ.), G. H. Lovegrove and H. Prince (sq.), certificates of distinction; W. A. Sadgrove (Occ.) and J. Parlett (Occ.), certificates of merit; (2nd year) G. W. Rogers (Occ.), certificate of distinction; F. M. B. Rosenthal, C. W. Wartze, H. A. Skelton, H. P. S. Wise, R. Johnson, J. E. Doyle, R. Mac-Gill Wartze, and J. R. Thuraingham, certificates of merit.

Architectural Specification: G. H. Lovegrove, certificate of distinction; W. A. Sadgrove (Occ.), H. Prince, and G. W. Rogers (Occ.), certificates of merit.

Architectural Professional Practice: H. Prince, W. A. Sadgrove (Occ.), and G. H. Lovegrove (sq.), certificates of distinction.

EVENING CLASSES.

The following awards have been made to students attending the evening classes:—

Given by the Clothworkers' Company (metal-work), G. T. Jolland.

Given by the Clothworkers' Company (wood-work), C. A. Colyer.

Given by the Carpenters' Company: Building Construction: silver medal and prize of £3 in books, F. Hartnoll; bronze medal and prize of £2 in books, F. J. Jones; certificate of distinction and prize of £1 in books, C. A. Colyer. Sanitary Science: Alderman Sir Faudel Phillips' medal, G. H. Spears. Constructional Drawing: certificate of distinction and prize of £3 in books, F. J. Jones; certificate of distinction and prize of £2 in books, C. H. Wheeler; certificate of distinction and prize of £1 in books, A. Bradburn. Quantities: certificate of distinction and prize of £3 in books, A. Bradburn; certificate of distinction and prize of £2 in books, J. D. Robertson; certificate of distinction and prize of £1 in books, A. Miles. Architectural History: silver medal and prize of £2 in books and prize of 10s. in books for architectural sketching, H. Prince; bronze medal and prize of £1 in books and prize of £1 in books for architectural sketching, R. C. Wiles; certificate of distinction and prize of £1 in books and prize of 10s. in books for architectural sketching, G. H. Lovegrove. Architectural History: T. H. B. Scott, certificate of merit. Building Construction: T. G. Pallantine, H. G. C. Brewer, and A. Bradburn, certificates of distinction; C. H. Wheeler and P. B. Sands, certificates of merit. Constructional Drawing: H. Spicer, certificate of distinction; F. J. Cox, E. J. Gee, and R. G. Ballantine, certificates of merit. Quantities: F. C. Moon and W. S. Wilson, certificates of distinction; F. Davies, W. Fenn, and H. Byron, certificates of merit.

Professional Practice.

Lowestoft.—Messrs. Isaacs and Florence were the architects of the new Empire Hotel which has been built for Messrs. Spiers and Pond, and Messrs. William Johnson and Co., L'd., of Wandsworth Common, were the builders. It is situated on the high Kirkley Cliff at the southern end of the town, and has a sea frontage of more than 500ft. The gardens are three acres in extent, and include lawns and greens for tennis, croquet, bowling, and other forms of recreation. The hotel itself is built of red bricks with Ancaster stone dressings, and comprises four floors and a basement. From the lofty tower surmounting the building a view extending almost to Norwich may be obtained. Inside, the hotel has been tastefully furnished and decorated by Messrs. Smee and Cobay. On entering the building one notices first the large grand hall, opening from which are the *salle à manger*, restaurant, drawing, smoking and billiard rooms, and the library. The grand hall is panelled in wainscot. Above the panelling the walls are painted a soft cream colour. The *salle à manger* is similarly upholstered, with the exception that it is richly papered above the panelling, and the other rooms have been carried out after the same style. The billiard room is panelled in mahogany, and the drawing room is decorated in Louis Quinze style. From the grand hall a staircase of solid oak leads to the upper floors. The hotel is lighted throughout by electricity, and, in consequence of the growing popularity of Lowestoft as a winter resort, radiators have been provided for heating the public rooms and corridors. The electric light and engineering plant is contained in a detached building. On all the floors are shaded verandahs.

Great Missenden, Bucks.—After eighteen months the work of restoring the parish church of Great Missenden has been completed. It has been the continuous desire and effort of the committee, acting under the direction of the Diocesan Architect, Mr. Oldrid Scott, to retain all old features characteristic of the late Decorated and Perpendicular periods, during which the present church was built. The arcade work in the chancel, which was found in a ruined state, has been elaborately restored and carved under the direction of Messrs. Tuttle, of Lincoln, and is now believed to be an exact reproduction of the old work. Beneath this arcading is a beautiful little door, with particularly finely-moulded jambs, which, with the abbot's door opposite to it in the south wall, has been uncovered after having been blocked up and plastered over for centuries. At each side of the chancel is a cleverly-carved string course, under which, on the north side, has been opened out the leper window, glazed with all the pieces of old stained glass that were found in various parts of the church. The holy table is of oak, carved by Mr. Robinson, of London. So also are the clergy and choir stalls, carved by Messrs. Bridgeman, of Lichfield. The floor of the chancel is paved with encaustic tiles, specially reproduced for this restoration by Messrs. Godwin, of Withington, Hereford, being copies of the old tiles found in the Abbey grounds. Opening out of the chancel on the north side is the new organ chamber. Proceeding westwards, the aisles are paved with unglazed red tiles, broken here and there by the black marble slabs of the vaults of those buried in the church in early times, and bordered with black glazed tiles. The floor under the seats is of wood blocks. The seats are of the best Dantzog oak. The fine old pillars, which had been sadly mutilated and defaced, have been thoroughly repaired and cleaned from numberless coats of paint and whitewash. The stonework of the arches now stands clearly out in contrast with the duresco of the walls. The rough blocks at the heads of the capitals have been grotesquely carved as originally intended. The font, having been carefully repaired and placed on a stone base surrounded by encaustic tiles, stands in the centre aisle at the west end. Considerable changes have been made in the north transept. In the east wall two archways have been found and opened out

UNIVERSITY OF LONDON: NEW PASSMORE EDWARDS HALL IN CLARE MARKET.
MAURICE B. ADAMS, F.R.I.B.A., ARCHITECT.

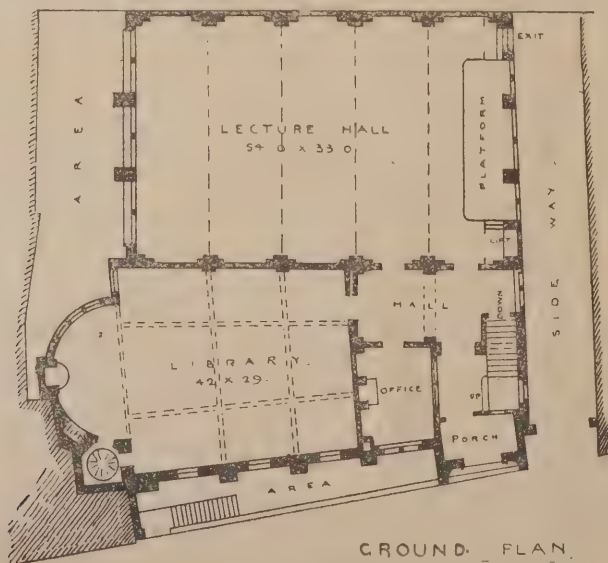

one above the other, leading by a spiral staircase to the rood loft. The west wall of this transept has been removed, and an arch and a new pillar with a carved capital substituted with most striking effect. Practically the north aisle may be regarded as new, the walls having been found to be in such a decayed condition that complete rebuilding was necessary. The contractors who have carried out the work of restoration are Messrs. Matthews Brothers, of Winslow, the stonework having been specially in charge of Messrs. Wise, of Winslow, and the ironwork in charge of Messrs. Barford and Norcutt, of Maidenhead. It is intended to light the church with acetylene gas. About £3,800 has been expended.

London.—We illustrate on this page the new home of the Faculty of Economics and Political Economy in the University of London, now being erected on a site in Clare Market. On the ground floor there will be a lecture-hall, 54ft. by 33ft. and 21ft. high, and a library.

reading-room running up through two floors. The stack rooms are in the basement, and will furnish shelvings for 100,000 volumes. Cycle shelters, cloak-room, and pantry accommodation are also provided in the basement. The irregular shape of the site has been utilised in such a way as to ensure symmetrical apartments; the odd outline of the land extending behind the adjoining premises in Clare Market is occupied by the apsidal end of the library, where a circular staircase and a lift will connect it with the lower and top floors of the building. No light could be obtained from the south and east sides of the site; consequently a large area had to be formed for this purpose, and in this way sunshine will be obtained for the rooms in the front of the building, which faces north. An iron gallery extends round the reading room at the mezzanine level, and in this floor the clerk's general office is placed, with an enquiry office below next the entrance. The principal's room is on the first floor. Here the larger classrooms for the school will be located, with others on

the second floor. There, too, are placed the students' common room, teachers' common room, lecturers' rooms, lavatories and closets for both sexes. On the third floor the apartment for the housekeeper, librarian's work and filing rooms occupy the space. There is also a large airing yard in connection with this floor, an iron bridge spanning the space between the two rear wings of the building. On the west side of the hall a 10ft. way will give light and means of egress from the hall by way of the emergency exit. Adjoining will be the Institute, of which Mr. Justice Grantham is the chairman, and which is to be erected in memory of the late Right Hon. Mr. W. H. Smith, M.P. The lecture theatre of the Passmore Edwards Hall, in addition to the large windows at either end, will have a top light in the central bay of the arched ceiling, so that the illumination will be well diffused; side windows were impossible, owing to the adjoining properties. The trustees of the institution are Dr. Creighton, Mr. Haldane, Q.C., M.P., and Mr. Sidney Webb, L.C.C. The main cost of the fabric has been provided by Mr. J. Passmore Edwards. The design of the building was chosen in a limited competition, the plans submitted being reported on by Dr. William Garnett, the secretary of the Technical Education Board of the London County Council. The referee in his report pointed out that more than 80 per cent. of the total cubical contents had been utilised for useful purposes. The whole of the main staircases and the flooring throughout is in concrete, by Messrs. B. Ward and Co., of Westminster. The exterior fronts will be faced with Messrs. Lawrence and Sons' orange-red bricks, the porch entrance will be in Norwegian granite and Portland stone and Hopton Wood steps, and tympanum for the dedication inscription. The masonry will be in massive scale, and sculptured figures of "Knowledge" and "Power," by Mr. Nathaniel Hitch, will flank the entrance. Broseley tiles, by the Coalbrookdale Company, will cover the roof. Messrs. Burt and Potts' metal casements will be used for the mullioned windows. Mr. Howell J. Williams, of Bermondsey Street, S.E., is the builder, and the architect is Mr. Maurice B. Adams, F.R.I.B.A. The cost of the building, including the value of the site and providing fittings, will be about £30,000.

Merthyr.—The new workhouse infirmary which has been erected from the designs of Mr. E. A. Johnson, of Abergavenny and Merthyr, fronts the south-west, and has a width of 240ft. It is built of the best Ebbw Vale yellow brick, with stone dressings from Darbydale, in Derbyshire. On the left stand the women's wards, which have two floors, and in which provision is made for forty-six beds, there being an allowance of ground for future extension. The administrative block—a three-storied building—occupies the central position. On the ground floor of this block are two rooms for the nursing staff, a room for the medical officer, a dispensary, and an operating room. At the rear is the kitchen block, the

GROUND PLAN

FIRST FLOOR PLAN

kitchen being fitted up with steam cooking apparatus fixed by Messrs. Williams and Son, of Cardiff. On the first floor are lying-in and labour wards, containing ten beds, and on the second floor are the nurses' bedrooms. The men's wards—which, like those for the women, have only two floors—are situated on the right, and provide accommodation for seventy beds. The administrative block is connected on either side with the other two by a roofed open corridor. Each particular ward has its separate bath and lavatory facilities. Messrs. Thomas Watkins and Co., of Swansea, were the builders. The original contract price for the building, apart from the kitchen block—which was the subject of a separate letting at £1,598—was £11,097, but this amount has been exceeded. The furnishing has been carried out by Messrs. Ben Evans and Co., of Swansea, at a cost of nearly £1,300.

Bristol.—A new wing has just been added to the Nurses' Home in Turell Street in connection with the Bristol Royal Infirmary. The entire structure contains bedroom accommodation for 93 nurses, and to a great extent the nurses have separate rooms. There are also recreation and reading rooms, superintendent's sitting-room, cloak room, box room, and numerous bathrooms, in addition to kitchen and domestic offices. The bedrooms of the new part are arranged four storeys high on each side of an L-shaped corridor, and they are approached by fireproof staircases. An external fire escape is also provided, and the roof and corridor are of fireproof construction. The heating of the building is by hot-water pipes, and the ventilation of each room is effected by flues communicating with a central extracting shaft. The whole of the building is lighted by electricity. By the acquisition of an adjoining piece of land it has been found possible to form a spacious garden, sufficiently large to provide a tennis court and other means of outdoor recreation. The new building has been erected by Messrs. G. Downs and Son under the supervision of the architect, Mr. W. V. Gough, of Bristol. The cost, including an extension of the site and furnishing, together with repairs, alterations, and partial refurnishing of the older house, has been about £8,600.

Salamanca Cathedral.—A fire broke out in this Cathedral last week, doing considerable damage to the tower and nave.

Model Plans for Bradford Workmen's Dwellings.—The Building Committee of the Bradford Corporation had before them on Wednesday last two sets of plans for workmen's dwellings, prepared respectively by the chairman, Alderman Hardaker, and by Mr. O'Flynn. The houses will provide a living-room 15ft. long by 14ft. 6in. wide, with a scullery, containing a bath on the ground floor, with two bedrooms above, and a good-sized attic. The cost of building such a house is estimated at about £225, including the land. The Committee approved the plans, and decided to have them lithographed, with the intention of placing them on view in the City Surveyors' Office, for the inspection of local builders.

L.C.C. Central School of Arts and Crafts.—The annual exhibition of students work at the above institution was opened to the public on Monday last, and remains open daily throughout this week, between the hours of 12 noon and 8.30 p.m. The school, established by the Technical Education Board of the London County Council four years ago, is situated at 316 Regent Street, opposite the Polytechnic, and has been very successful in attracting students engaged in artistic crafts, nearly 600 having been in attendance during the session just closed. The work done by students includes bookbinding, silversmiths', goldsmiths', and jewellers' work, chasing and engraving, enamelling, stained glass, ornamental lead work, stone work (by architects), woodcuts in colour (by a method based on Japanese practice), embroidery, wood carving and gilding (applied mainly to picture frames), lithography, writing and illumination, and modelling and designs for various processes. 51

INDIGENOUS AND INVENTIVE ARCHITECTURE FOR AMERICA.*

By ELMER GREY.

ONE of the purposes of this organisation, as expressed in your constitution, is "to encourage an indigenous and inventive architecture, and to lead architectural thoughts to modern sources of inspiration." In commenting upon the manner in which such purpose shall be attained, in the hope that my point-of-view may not be without some value, I shall assume that the indigenous and inventive qualities in our architecture will, when obtained, appear in its style. Next, I purpose to indicate, as clearly as I am able to, the nature of this quality called style; and then I shall take up the words "indigenous" and "inventive" in their order, and attempt to show how, in my opinion, we can best go about to attain to an "indigenous and inventive architecture" in America.

The nature of an architectural style is closely akin to the nature of the personal style of an individual. In the case of the individual it is, of course, the result of his continued endeavours to improve his character. In doing so he does not ape someone else, neither does he discard the example of heroic types that have lived before him, or who are living in his own time. He attempts to discover the laws which ruled or rule such lives, and endeavours to follow similar laws in arranging his own conduct.

In much the same way is style in architecture evolved. We are not to copy past styles, neither are we to consider them useless as modern sources of inspiration. We are to try to discover the laws which governed their success, to discern how those laws should be modified to suit existing conditions, and then to apply them in the solution of our own problems. The result will be beauty, the exact nature of which we may not be able to define, but, like the quality in a man of which he is unconscious, but which others feel to be his personal atmosphere or style, it will be all the more vital and all the more precious because defying analysis.

The Laws of the Styles.

In attempting to discern the modifications to be made to the laws which governed the success of past styles we are to consider, first, our increased complexity of material requirements over those of past ages, brought about by an advanced social condition, and the means of satisfying such increased demands afforded us in improved methods of construction and in new forms of building material. We are also to consider that in all ages artists have drawn upon the work of their predecessors in seeking for inspiration, and that we are particularly fortunate in having more of such precedent to draw from and in being provided, through the art of photography and through facilitated travel, with much readier means of access to it.

These are some of the considerations that should be incorporated as modifications of the laws which governed the success of past styles and of the laws which we are to apply as aids in evolving a style of our own. Now, how can we best go about to attain an "indigenous" architectural style in America? What should be our sources of inspiration in aspiring to it? Are we, in seeking for them, to expect that they will appear only in things which refer to a building's external adornment? And even so, would we, in an appreciation of the beauty of all the architectural ornament of other times and of our many facilities for enjoying it, be likely to express such appreciation in our art, did we reject as sources of inspiration all things not American? Surely not. The sources of inspiration for an indigenous style of American architecture are not thus limited. Style is not the external adornment of a building; it is the vital quality of it which has resulted from conditions inherent in its making, and which include situation, cost, material requirements, the constructional means

available for meeting those requirements, and the ornament with which it was thought fitting to clothe it. As the modern

Sources of Inspiration

for an indigenous style of architecture in America lie in a perception of the possibilities of the sites of our structures, in a knowledge of the most advantageous method of disposing the money available for their erection, in the insight which shall discern the vital offices buildings should fulfil and the manner in which they should fulfil them, in the familiarity with the building methods and building materials best adapted to accomplish such fulfilment; and, finally, in all things which suggest the forms of ornament most fitting for the purpose of adorning our structures.

And now how can we have an "inventive" architecture for America? That is, a new architecture, one that did not before exist; an architecture that shall be not only distinctively American in its style, but that shall also be new in its style.

In an address before the Boston Architectural Club in October, 1893, Mr. Robert D. Andrews said: "I think it is the custom nowadays to put our conscious effort in the wrong place in the treatment of art. We put it at the end, when it ought to be at the beginning. We elaborate our superstructure, but treat the foundation as of little account." I believe that custom still prevails.

The poets never tire of calling our attention toward the Unity of Life, toward the intimate relation all living things bear to one another; and toward the fact that this relation is a far more intimate one than we generally feel it to be. Scientific research in all its ablest conclusions emphasises the same point, insists upon the

Oneness of all Nature and all Life;

upon the fact that each plant in nature is not a self-dependent organism, but that its health and its life is governed by a force which controls and sustains all living objects; upon the fact that a man is not an independent organism, but that, whether he is conscious of it or not, his fortunes are governed by a higher ambition than his own; though he is given free will to choose between the good and the bad, his final destiny will rest upon obedience or disobedience to physical, moral and spiritual laws over which he has no control.

Now, art—that is, living art, true art, art that is not merely a thing of dead forms and formulæ—is one of the most potent expressions of human life. It is the conservation culminated in material form of all the artist has had of knowledge, of skill, of experience, of character; and it is subject to the same laws which govern life, and is a part of the same great unity; so that by ascertaining how those laws operate in the production of new things, of inventive things in nature, or in life, we shall also see how they operate in the creation of new things in art.

In nature we find that a plant produces in leaves, flowers and fruit only that which it has been able to draw in another form from the earth, the sun and the air; and that its perfection and distinction of type are directly dependent upon the success with which it obtains such nourishment in qualities and quantities suited to its particular needs. And in life we know that a man can give out only that which in another form he has previously taken in; and that the distinctness of his individuality, and the value and amount of his productiveness, will directly depend upon his knowledge of the sources of power which best sustain him and upon his obedience to the laws which govern his nature.

And so it is in art. For the artist is not an independent worker having supreme control over the quality and number of his creations. He is a part of a divine order of life, from which all his efficiency springs, and the originality and sustained excellence of his work depend upon the degree to which he becomes conscious of his relation to that order, and upon his recognition of and obedience to its laws in their application to his life. Now, the

* A paper read at the Second Annual Convention of the Architectural League of America, held at Chicago in June last.

Application of Universal Law

which governs the life of an individual artist each artist must discover for himself through the process of living, but some of the laws themselves, in their wider bearing upon all artists' lives, may here be briefly enumerated. The artist, then, is, first, a man, and is to know himself and the world; that is, he is to recognise the natural equipment for work with which he has been endowed, the degree and nature of its power and also its limitation, and he is to try to discover the place it should occupy in the world's entire economy. As a man, he is also to recognise the importance of the physical side of his being, and he is to see that it is kept in the highest condition of efficiency for sustaining the work of his brain.

Then the artist is a member of a social body; and if his work is to meet the highest demands of that body, and to satisfy its best taste and judgment, he must obey the moral laws which require that he place himself in sympathy with that body. And herein enters the subject of compensation. For as a member of a social body the artist will increase in every possible way his own power for usefulness and good—and the power which rests in the wise use of money is one not to be ignored. On the other hand, if his work is to satisfy his own conscience and to secure him the largest degree of self-development, as well as to bestow the greatest benefit upon his client and to accord with the highest public welfare, he will not place pecuniary gain higher in the scale of values than he will excellence in the quality of the work he puts forth.

And now we come to the spiritual laws governing the life of an artist. We readily recognise the operation of physical and moral laws in our work, but we have yet to realise more fully that the artist is also a part of a universal spiritual order from which beauty of the highest kind has always come, and that if he is to produce a new beauty, an inventive beauty, which shall have a real and enduring charm, he must first absorb in other forms that which he creates.

What Constitutes Beauty in Architecture.

For beautiful things of lasting quality in architecture and in all the arts are not tricks of clever fancy which some fortunate ones may discover; they are the result of an assimilation of many kinds of order, and of beauty and of truth into the soul of the artist, where they undergo an unconscious process of transmutation into the creations which his imagination brings forth, and which his knowledge, his skill and his character shape into new material form. He may obtain this nourishment from all sources which he finds will enrich him—from Nature, from human experience, from religion, from literature, from painting, from the architecture of the past. But whatever sources he selects should be capable of refreshing him continuously. For the artist is constantly spending his vitality in creative work, and so must continually renew it. Both operations are equally important parts of a creative process, and should be equally instinctive habits of the artist's life. They are analogous to the workings of Nature in her method of giving birth to all living things, and such instinctive habits have always been those of the man of creative genius, through whom all true art has been evolved.

Now, the architectural style of a country is the result of prolonged endeavour on the part of architects to erect buildings which shall accord with the best taste and with the soundest judgment of a people, and though the endeavours of those architects may often be thwarted and the accomplishment of their purpose seem at times a long way off, a higher power than their own will guide the course of events and a mightier destiny than any private or public ambition will finally determine the quality and the permanence of the country's architectural style.

Important movements in architecture, such as the so-called Romanesque of Richardson, occasioned by the influence of creative men of exceptional individuality may prevail

for awhile. The demands of unhealthful social conditions, such as inordinate accumulation of wealth by classes of people who lack corresponding degrees of culture, may result in the vulgar and ostentatious over-adornment of their buildings. But the architecture of a country which will be truly representative in style, and which will endure with a lasting beauty, will voice the highest ideals of its people, and will spring from the hearts of conscientious men who have accomplished the architectural expression of its noblest national life.

The attainment of such an architecture involves a process of growth which cannot be hastened. It requires a condition of wide and deep culture in the people of a country and a corresponding degree of culture in its architects; and though we have such culture in this country, either the reconciliation between the people who possess it or the form through which it is trying to find architectural expression is not complete enough to point definitely toward the qualities which distinguish an architectural style, or the intangible nature of style prevents our recognition of as much of one as we may have.

Perhaps, unknown to us, it is taking form in the many noble architectural monuments that have been and are being built by contemporaries. For all architectural beauty which is natural and vital to the best American life will contribute to the growth of an indigenous and inventive American architecture.

To further the growth of such an architecture in every possible manner should be our ambition; our methods should correspond with the noblest methods of men who are working for the benefit of mankind in other walks of life, and our hope of success should lie in a consciousness of our relation to the divine Source of all life, of all growth and of all accomplishment.

A Case about Residential Flats.

THE case of *Rogers v. Hosegood* heard last Thursday in the Court of Appeal was brought by the trustees of the will of the late Sir John Millais, as owners of property in Palace Gate, and by W. R. Rogers, the owner of adjoining property, for the purpose of enforcing restrictive covenants against the defendant, who is now the owner of the property known as Thorney House, at the corner of Palace Gate and Kensington Gore, and proposes to build a large block of residential flats upon it. The Court dismissed the Appeal. Lord Justice Collins said:—The covenant by the vendor to build a wall, if required by Sir John Millais to do so, in order to prevent Sir John Millais's windows overlooking the adjoining plot, does not seem to us to have any bearing on the point, and we are of opinion, therefore, that Sir John Millais's assigns are entitled to enforce the restrictive covenant against the defendant, and that his appeal must be dismissed. We are of opinion that such a block of flats as it is proposed to erect would involve a breach of covenant. Though we agree that such a building does involve a breach of the covenant that no more than one message or dwelling-house should be erected or standing on such plot, and that such message should be adapted for and used as and for a private residence, we think it is also a breach of the covenant in question. Though it is certainly not one message or dwelling-house only adapted for and used as a private residence, neither does it seem to us to constitute several separate dwelling-houses adapted for and used as private residences only, within the meaning of the covenant. We think residential flats, involving the use of a public entrance and staircase, do not answer the description of private residences contemplated by the words quoted. The covenant must, we think, be construed in an ordinary or popular, and not in a legal and technical, sense; and we do not think that residential flats, though for many purposes separate dwelling-houses, come within the popular description of the class of buildings which it was intended to permit. The cross appeal, therefore, of Mr. Rogers must be allowed.

New Patents.

The following specifications were published on Saturday last, and are open to opposition until August 20th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—5,338, BLAKEMAN, ratchet braces. 7,520, McLARTY, machinery for dividing, shaping, working, or dressing stone. 12,081, GEE, means and method for jointing and fixing rainwater piping in position. 12,339, ROSENTHAL, incandescent gas light burners. 12,400, FISHER, apparatus for mixing, transporting, and dumping concrete, &c. 12,413, BHISE, flushing device and water-waste preventer. 12,453, HODGKINSON, apparatus for making ridge-tiles and attachments to clotrolls for use in making such tiles. 12,461, HICKEN, fixing door and other handles to their spindles. 12,985, SELLARS, packages of cement. 14,024, MONAHAN and BARSDORF, excess load alarm or safety appliance for use chiefly with derrick or jib cranes. 14,573, SMITH, watering-carts. 14,725, MOUNTFORD, apparatus for use in decorating ceramic ware. 15,640, GERNAET and LIBERT, process for the manufacture of artificial stone. 15,964, COADY and COADY, ceilings and ventilators for apartments and buildings. 16,332, SIDEBOTHAM and SIBBALD, apparatus for hoisting and lowering purposes. 16,604, MASON and MASON, drainers for use with domestic sinks. 17,377, EADES and ALLDAY, hoists or lifts. 17,575, BOULT (*J. Miesse and Co.*), machinery for bevelling glass. 18,257, THOMPSON (*Simmons and Bocks*), manufacture of fire-resisting and water-resisting slabs and bricks. 19,165, KERTLAND, hanging of doors.

1900.—5,758, SCHLEGELMILCH and MANN, circular saws. 7,100, HOLLUB and MIGNAL, device for fixing incandescent electric lamps. 7,131, WHEDON, apparatus for burning garbage and other refuse material. 8,158, MONAUNI and KUBALA, stoves. 8,679, SPELKENS, closets. 8,814, HENNEBIQUE, construction of walls for quays, wharves, platforms, &c. 8,928, ALLISON (*Selg, Gumtrum and Selg*), filters.

Correspondence.

Liverpool School of Architecture.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Surely you inserted the block on p. 395 of last week's issue as a joke! The expression on the woman's face suggests the woman who lived in the shoe, while the scantiness of the children's clothing suggests a preparation for her subsequent action. Is such work really approved by the City of Liverpool?—Yours truly, ANXIOUS READER.

[It grieves us to learn that even one of the myriad readers of THE BUILDERS' JOURNAL should have been made "anxious" by the face of the lady in question. Perhaps she cannot help it. But we have no official information on the subject.—ED.]

Cast-Iron Stanchions.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—If your correspondent Mr. D. Forbes Smith, A.R.I.B.A. (see p. 412 of last week's issue), will look at a side elevation of his twin stanchion he will see that in that direction it is only equivalent to two single stanchions, and that the intermediate bracing is of no value in providing stiffness against deflection. The strength of any structure must be measured by its weakest part.—Yours faithfully, HENRY ADAMS.

The Death of Mr. A. Anderson, of Carden Road, Nunhead, at the age of 62 is announced. Mr. Anderson had of recent years, with his son, been developing building estates in the neighbourhood of Blackheath and Lewisham.

WATER FROM BELOW LONDON.

At a recent public meeting of the inhabitants of South London, Mr. Walker Moseley said the only true solution of the water question in London lay in the direction of making use of the great lake of pure water which was known to be underlying the Metropolis. He urged that the London County Council should induce every London vestry to follow the lead of Croydon, Newington, and Islington in this respect, as he said if the idea of sinking artesian wells were adopted by local authorities in one year there might be twenty wells yielding 1,000,000 gals. a day each. As compared with the great aqueduct scheme, the advantages to be gained were real purity and a saving of £20,000,000. A committee was afterwards formed for the purpose of drawing up a suitable scheme.

Mr. Moseley has since stated to a member of the press:

"It is a geological fact beyond question that there is an inclined plane of water, or a veritable lake, constantly passing away, and also constantly held in solution, in the chalk strata under London. This chalk strata is at varying depths, but always fairly accessible, below the ordinary London clay, and above the gault clay, which is impervious. Moreover, the chalk strata is to be found below any part of London and suburbs, and indeed right away to Dunstable and the Hertfordshire hills. From these hills a large and constant supply of water flows into the chalk strata, which going towards London is on an inclined plane of 13ft. to the mile. The water, as has been shown, permeates the chalk to the extent of half its bulk. So that we have practically an inclined plane of water constantly passing down the 20-mile course from, say, Dunstable to London. This water thus goes through a perfect filtration in the chalk, and a given volume of water, starting from Dunstable, takes thirteen months to reach the London chalk strata, so slow is the process of filtration.

"The quantity of perfectly filtered water always in reserve in the chalk strata under London amounts to 50 million million gallons, or at the rate of a thousand million gallons a day (fifteen years' consumption). The East London Waterworks Company have now sunk several wells, and are getting some 20,000,000 gals. a day. If the London County Council decided to have wells in all parts of London, or even say twenty wells yielding a million gallons a day, they would be well on the way to effecting a saving of £20,000,000, not to speak of obtaining a really pure supply of water."

An Architect's Action for Slander.

THE case of *Ramsey v. Ford* came before Mr. Justice Darling and a common jury in the High Court of Justice on July 2nd.

Mr. Tindal Atkinson, in opening the plaintiff's case, said his client was an architect at Sutton. At the election of the District Council in March last the plaintiff was a candidate. In the course of the election a Mr. O'Grady interested himself in the election on the part of the plaintiff. Mr. O'Grady met the defendant, who was chairman of the committee of another candidate, in the streets of Sutton, when the defendant said: "Your man is a disgrace to the town. He was the architect for those cottages in Beulah Road, which were condemned by the Council." A statement of that kind was likely to do the plaintiff injury in his election. Those statements were absolutely untrue, and the defendant did not allege that they were true. His defences were that he never uttered the words; that the words did not attack the plaintiff in his profession as an architect; and, thirdly, that it was on a privileged occasion.

After formal evidence of publication had been given, Mr. Herbert Ramsey, the plaintiff, was called and said he was not the architect of the cottages and had never seen them. In 1895 he had prepared plans for three cottages to be erected on the site in question. Those plans were sent in to the District Council and approved, but nothing further was done. In

May 1899 Messrs. Harris and Jolly, the builders, came to him with the plans. He told them that the plans could not be used. They asked him to prepare fresh plans, which were submitted to the District Council, and were passed in November 1899. Up to that he had nothing to do with the building of cottages on that site. Some cottages were pulled down on that site in July 1899, because plans had not been approved, and they were not in accordance with the by-laws. Cottages were put up under his superintendence on the spot where they had been pulled down.

For the defence the defendant was called, and said that he referred to the cottages as being a disgrace to the town, and did not use that term about the plaintiff.

Mr. Blake Odgers, for the defendant, submitted that the occasion was privileged on the ground that both O'Grady and the defendant had an interest in the subject matter; and also he relied upon the question put by O'Grady, "How was the plaintiff mixed up in the Beulah cottages?" The answer by the defendant would be privileged—*Harrison v. Bush* (5 E. and B., 348); *Wisdom v. Brown* (T.L.R., 412).

Mr. Justice Darling did not think that the occasion was privileged, and he also ruled that there was no evidence of express malice. In summing up to the jury, he said that they would need to decide whether the words were spoken of the plaintiff as an architect or as a candidate. If they were spoken of him as an architect, then they would be actionable; but if of him as a candidate, then they would not.

The jury found a verdict for the defendant.

Builders' Notes.

London County Council.—At last week's meeting of the Council the Improvements Committee reported that the greater portion of Middlesex Street was widened to 40ft. by the Metropolitan Board in 1883 in connection with the clearance of an insanitary area known as the Goulston Street, White-chapel, area, and that the Council, under its General Powers Act of 1892, extended the improvement by widening Sandy's Row, which formed a continuation of Middlesex Street. The Council also contributed half the cost of the continuation of the thoroughfare from Sandy's Row through Widegate Street to Bishopsgate Street, that work having been undertaken by the City authorities. It would be apparent, therefore, that the widening to 50ft. of a small portion of Mansell Street was alone needed to complete the line of good and direct communication from Bishopsgate Street to the Tower Bridge, and indeed to the Old Kent Road by way of the new thoroughfare now being constructed by the Council. The total net cost of the improvement proposed was estimated, after deducting recoupment, at £91,100. The report was passed without discussion.—The Building Act Committee recommended that the Council should not consent to the erection of an iron and glass shelter at the entrance to the Holborn Viaduct Hotel, as proposed. This was agreed to.—The same committee recommended that the Council should not consent to the erection of a projecting stone and granite portico or of an iron and glass pent at the main entrance of De Keyser's Royal Hotel on the Victoria Embankment, as shown upon the alternative plans submitted by Mr. E. A. Gruning. This the Council agreed to also.—The Improvements Committee reported that for some time past the necessity for the widening of Central Street, St. Luke's, had been urged upon the Council. They recommended: "That the estimate of £81,250 submitted by the Finance Committee be approved, and that subject to the Vestry of St. Luke's contributing £12,500 towards the cost of the complete improvement, the Improvements Committee be authorised to acquire from the Ironmongers' Company, at the price of cleared land, so much of their freehold as is needed for widening Central Street to 50ft. . . . between Old Street and Clarence Place." This was agreed to.

Surveying and Sanitary Notes.

Street Nomenclature.—Strange indeed is street nomenclature in the City. Ducks-foot Lane, in Billingsgate, is a corruption of the Duke's-foot Lane, signifying the time when his Grace of Buckingham had a mansion in the vicinity; and Moorfields perpetuates the fact that at one time the district was a marsh and moor, around which were fields in which the citizens of former days were wont to disport themselves.

Opening of Public Gardens at Islington.—The gardens and recreation grounds which have been acquired at a cost of £16,000 by the Islington Vestry in Market Road, Caledonian Road, adjacent to the Metropolitan Meat Market, were recently thrown open to the public by Mr. Thomas Lough, the member for the division. Originally the site of the grounds was a plot of waste ground on which rubbish used to be dumped, but the Vestry have now transformed it into a most acceptable open space, which will prove a great boon to the crowded district surrounding it.

Value of Government Property in London.—A parliamentary return has been issued giving particulars of property in London occupied by the Government. The Houses of Parliament and the Government offices in Westminster are valued at £133,963; the General Post Office, the site of which covers portions of several City parishes, is put down at £32,000; in Chelsea the barracks and other buildings are assessed at £3,500 on a total value of £12,000; the British Museum and other buildings are valued at £13,675, and the Record Office at £18,600; the Arsenal and other offices at Woolwich contribute £27,000 on an estimated total of £89,000.

The Property Market.—The freehold building site now occupied by the business premises, Nos. 18, 19, and 20 Noble Street, City, possessing a frontage of 46ft. 3in., and covering an area of 3,270 superficial ft., was sold at the London Auction Mart, Tokenhouse Yard, E.C., on Wednesday for £12,900. The freehold block of buildings, Nos. 14 and 15 Silver Street, City, otherwise Falcon Hall, which has a total frontage of more than 90ft., and covers a superficial area of 4,100ft. was withdrawn at £32,000. Much interest was manifested in the offer of the Hadham Hall estate, near Bishops Stortford, a freehold sporting and residential estate of 1,628 acres. The fine old Elizabethan manor-house and about 1,301 acres were submitted in one lot and withdrawn at £20,000, but several portions of the estate were subsequently disposed of, Wickham Hall and 501 acres realising £8,250. An important feature of last Thursday's proceedings was the offer of the Garthyngghared estate, Dolgelly, North Wales, a freehold residential property comprising a substantial mansion of Tudor design and 7.0 acres. It was withdrawn when the bidding had reached £23,500.

Masters and Men.

Cheshire Wage Dispute Settled.—The wage dispute between the builders and bricksetters of Wilmslow, Alderley Edge, and other Cheshire districts has just been settled, the masters having decided to grant an increase of a half-penny per hour; the bricksetters struck work some weeks ago for an advance of a penny. The men will now receive 9d. an hour; the increased rate of pay will affect a large number of men. Much building is now going on.

Newcastle Building Trade: Reduction of Wages.—Last week the Tyneside District Master Builders' Association and the Gateshead Master Builders' Association decided "that the time has now arrived, considering the state of trade and the fact that they are facing a falling market, before work can be resumed a reduction of 1d. per hour from 10d. to 9d. shall be made in the wages of operative bricklayers, and a new code of working rules be adopted."

Keystones.

In Wickmere Church, Norfolk, a stained-glass window is about to be erected by Messrs. Weyer and Co., of Norwich.

Birkbeck Building Society.—Last year the receipts from members' subscriptions totalled £278,000; £1,037,378 were invested.

A New Chancel to Wandsworth Parish Church is being erected from designs by Mr. Edward W. Mountford, F.R.I.B.A. It will cost £3,600.

Mr. Edgar M. Leest, architect and surveyor, of Devonport, has been elected a Town Councillor for the town in the place of the late Mr. Councillor Philp.

The Ancient Monuments Protection Bill, which was referred to on page 240 of our issue for May 9th last, has been read a third time in the House of Lords and passed.

Dangers of Sewer Gases.—On Friday last three men were killed and four injured by sewer gas in the ejector chamber of the sludge press-house at the Corporation Wharf, Southampton.

New Paris Statue.—On July 4 h. M. Loubet presided at the unveiling of a statue of La Fayette, in the Place du Carrousel, presented to France by school children of the United States.

James E. Beard and Co., Ltd.—On page 413 of last week's issue we stated that the capital of this new company was £5,000. The secretary informs us that this is not so; the capital is £11,000.

A New Wesleyan School at Illingworth is being built from designs by Mr. Arthur G. Dalzell, architect, of Halifax, at an estimated cost of £1,100. The largest room will be 40ft. by 28ft.

Cardiff Town Hall.—A protest is being made against the proposal to erect the new Town Hall buildings at Cardiff, on the ground that the present time is inopportune, the prices of building materials of all kinds being exceptionally high.

An Old Church Bell.—In the parish church at Wingrave is a fine old bell, which the Buckinghamshire Archaeological Society is seeking to have preserved. It was cast in the middle of the fifteenth century by John Danyell, of London. To preserve the bell and substitute a new one will cost £79.

Eversley Rectory.—A laudable effort is being made to preserve Eversley Rectory, the historic building closely associated with the life and work of Charles Kingsley. It is thought that the building might very appropriately be dealt with after the manner of Milton's Cottage at Chalfont St. Giles, and by degrees converted into a Kingsley Museum.

Improvements in Crewkerne Church.—New oak choir stalls, polished Devonshire marble steps in the chancel and sacrum, marble squares over the sacrum, the paving of the chancel with tiles, and other works have just been completed in this church by Messrs. Harry Hems and Sons, of Exeter, under the superintendence of Mr. Howard Gaye, architect.

Laying Out of the Grounds of the Grove Hospital.—The Metropolitan Asylums Board has accepted the tender of the Practical Landscape Gardening and Estate Development Company, of 49 Victoria Street, E.C., at the sum of £3,000, for laying out the grounds of the Grove Hospital in accordance with the plans and specification prepared by Messrs. H. E. Milner and Son, landscape architects.

Westminster Abbey becoming Darkened Inside.—This is the result, says Mr. Thackeray Turner, the secretary of the Society for the Protection of Ancient Buildings, of accepting the offers of new stained-glass windows for the old Abbey. "Even on a bright summer's day there is not sufficient light to see the beauties of its interior." He urges those interested to go and see for themselves.

Terrace Houses for Roundhay, Leeds.—We understand that the Leeds Builders, Limited, have purchased a choice plot of building land at Lidgett Park, Roundhay, on which they intend shortly to erect twenty-three terrace houses of a class for which there has been a demand in this district.

Devon and Exeter Architectural Society.—We have received a copy of the Journal of Proceedings of this society for the 1899-1900 session, and we note that there is a balance of about £19 in hand. The Journal has a good illustration of Clewe Abbey as a frontispiece. The members of this society made an excursion to Ottery St. Mary recently, visiting Cadhay House and Ottery Church.

The Old Grey Coat Hospital at Westminster, which has just been presented by the Queen with a portrait of herself, is a quaintly-built red brick house, with an old-world garden ablaze with flowers, standing in what is still known as Totbill Fields. The old board room contains many portraits of past governors; indeed, this curious old building, with its broad oaken staircase and wainscotted hall, is very much as it was in 1702.

Gray's Inn Road Workhouse.—With regard to the proposed building of casual wards on the site of the old workhouse in Gray's Inn Road, the Local Government Board suggest that the Guardians should send an architect to confer with one appointed by the Local Government Board; or, in the alternative, invite plans and submit them to the higher authority. The suggestion was to invite four architects to compete. The matter has been referred to the Building Committee.

The death is announced of Sir Thomas Farrell, president of the Royal Hibernian Academy, at his residence, Stillorgan, county Dublin. He was the son of Mr. Terence Farrell, R.H.A., and was born in 1829 and created a Knight in 1894. Sir Thomas Farrell was an eminent sculptor, and executed many statues of Irish public men. The bas-relief on the Wellington memorial, Phoenix Park, Dublin, representing the last charge at the battle of Waterloo, is an example of his work.

The Alexander Memorial.—The Czar will visit Moscow in August to lay the foundation stone of the monument to the Emperor Alexander III. There has been much difficulty in choosing a site for this memorial; but it has been finally decided to place it outside the Kremlin, at the north-east corner of the square on which the Cathedral of the Saviour stands—the corner, that is, nearest to the Kremlin, and overlooking the Moscow River. The memorial is estimated to cost about £300,000, which has been largely raised by public subscription.

Copyright in Sculpture.—At last Thursday's sitting of the Copyright Committee in the House of Lords, Mr. T. Brock, R.A., was called as a witness to speak for sculptors. He contended that in the case of a statue of an historical person, such as Cromwell, the sculptor should be allowed to make replicas, because the object of the monument was to do honour to Cromwell, and the greater the number of statues the greater the honour. There would, moreover, he thought, be no injustice to the person who commissioned and paid for the statue.

London's Gate-houses.—In the days when every man's house was his castle, not only in theory but also not infrequently in practice, a gate-house was an absolute necessity to every dwelling built on the courtyard plan. Many gate-houses still remain scattered about England; not a few still form the entrances to country mansions and colleges, while others, mostly those belonging to monastic houses, bear pathetic witness to the departed glories of the buildings they once guarded. London's gates have all disappeared, and of her once numerous gate-houses only five remain. These are St. James's Palace, Lambeth Palace, Lincoln's Inn, St. John's, Clerkenwell, and No. 17 Fleet Street—the Temple Gate-house.

Architects for Kirkcaldy Police Buildings.—The Kirkcaldy Town Council have appointed Messrs. Williamson and Inglis, Kirkcaldy, architects of the new police buildings. Dr. Rowand Anderson, Edinburgh, who was appointed adjudicator of the sixteen plans submitted, placed the plan of Messrs. Scott and Campbell, Edinburgh, first; that of Mr. Alexander Cullen, Hamilton, second; and Messrs. Williamson and Inglis's plan third. Colonel M'Hardy, of the Prison Commission, who was asked to make suggestions on the three plans, stated that the plan of Messrs. Williamson and Inglis was the one which, in his opinion, most nearly met his views in regard to internal arrangements and working.

Building in Leeds.—The annual report of Mr. William Towers, Building Inspector to the Leeds Corporation, for the year ended March 24th shows that during the twelve months 3,059 houses were built, including 16 villas, 59 semi-detached villas, 841 through houses, and 2,143 of the back-to-back description. There were also put up 1,423 buildings of a miscellaneous character. Among these were one church (Chapel-Allerton), an addition to a church, one chapel, one mission-room, six schools, nine additions to schools, one hotel, three hotels rebuilt, one hotel, additions to the workhouse, one Corporation bath, and two additions to the Yorkshire College. The total plans submitted numbered 2,784, of which 2,169 were approved, showing 9,439 buildings, of which 3,549 were houses.

Trade and Craft.

Hot-water Baths.

A warm bath is as agreeable and necessary during warm as during cold weather—but the kitchen fire which, in most houses, makes this pleasure possible has the drawback of heating the building when it is especially desirable to keep it as cool as possible. A kitchen fire is a friend when snow is on the ground and the north wind blows, but it is scarcely endurable when the thermometer stands at 90 deg. in the shade. Hence the utility of the "Lightning" geyser made by Messrs. Ewart & Son, of 346-350, Euston Road, London. This firm have, in the design of their apparatus, always kept in view the necessity of ensuring safety in use, and hold several important patents for avoiding burning, explosion, or other risks appurtenant to the "geyser" when it was first placed on the market. They have received numerous awards for their apparatus, which supplies a very safe and very convenient means of obtaining hot water. A novelty which Messrs. Ewart & Son have introduced is a bath seat; it is made in two qualities, one (called the "Necessary") costing 5s., and the other (called the "Desirable") costing 10s. 6d. This seat will fit any bath, and consists simply of a hard wood centre portion supported by arms extending over the sides of the bath.

COMING EVENTS.

Wednesday, July 11.

INSTITUTE OF SANITARY ENGINEERS.—Meetings of the General Purposes and Finance Committee, 3.30 p.m., and of the Election Committee, 5 p.m.

Friday, July 13.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Annual Excursion to Kilkenny (first day).

Saturday, July 14.

ARCHITECTURAL ASSOCIATION.—Third Summer Visit to Mr. O. Eames Rempe's House, Hayward's Heath, and to Cuckfield Place.

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Visit to Royal Naval College, Greenwich. Boat at Old Swan Pier, London Bridge, 3.30 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Annual Excursion (second day). Visit to Jupoint Abbey.

Saturday, July 21.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS, NEWCASTLE-UPON-TYNE.—Council Meeting. 1.30 p.m.

Saturday, July 28.

ARCHITECTURAL ASSOCIATION.—Fourth Summer Visit to Stowe House, Buckingham, and Buckingham Church.

CONTRACTS OPEN.**EPSOM URBAN DISTRICT COUNCIL.**

The Council are prepared to receive APPLICATIONS from Builders willing to Tender for the ERECTION of an ELECTRIC SUPPLY STATION at the rear of their Offices in Church Street, Epsom.

Builders must send in their names to the Architect, Mr. A. E. PRIDMORE, 2 Broad Street Buildings, E.C., together with £2 2s. for the bills of quantities, which will be returned on receipt of a bona-fide Tender.

The forms of Tender and bills of quantities will be sent to builders on JULY 13th, and the drawings and specifications may be seen from this date at the Offices of the Architect and of the Town Surveyor, Epsom.

The builder shall under a penalty of £50 observe the rates of wages obtained in the several trades employed.

Tenders are to be delivered at the Clerk's Offices, Epsom, on or before FOUR o'clock, on JULY 25th inst., on the printed forms supplied.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
E. G. WILSON,
Clerk of the Council.
Epsom,
July 1900.

VESTRY of ST. MARY MAGDALEN, BERMONDSEY. DUST DESTRUCTOR AND ELECTRICITY SUPPLY. CONTRACT NO. 3.

The Vestry of St. Mary Magdalen, Bermondsey, invite TENDERS for the ERECTION of a GENERATING STATION in "Heckinger," Spa Road.

Specification, bills of quantities, and form of Tender can be obtained, and plans inspected, on and after the 14th inst. at the Town Hall, Spa Road, Bermondsey, on payment of a fee of Three Guineas, which will be returned on receipt of a bona-fide Tender. Plans and specifications may also be inspected (but not obtained) at the Offices of the Engineers, Messrs. KINCAID, WALLER & MANVILLE, 29 Great George Street, Westminster, S.W.

The contractor will be required to pay not less than the minimum standard rate of wages for the time being in each trade during the continuance of the contract, and to pay all labourers a minimum rate of wages of not less than six-pence per hour.

The Vestry do not bind themselves to accept the lowest or any Tender, and the contractor whose Tender is accepted shall enter into a formal agreement, under seal, with sufficient sureties for the due performance of his contract.

Sealed Tenders, endorsed "Generating Station, Contract No. 3," must be forwarded to me at or before NOON on the 26th day of JULY, 1900.

Town Hall,
Bermondsey,
July 1900. FREDK. RYALL,
Vestry Clerk.

LICHFIELD UNION.

TO BUILDERS AND CONTRACTORS.

The Guardians of the Poor of the Lichfield Union invite TENDERS for the ERECTION of NEW CASUAL WARDS on a site at the rear of the Union Workhouse, Trent Valley Road, Lichfield.

Persons desirous of Tendering may inspect plans, specification, and conditions of contract between the hours of TEN and FOUR o'clock, at the Office of the Architect, Mr. W. H. WOODROFFE, A.R.I.B.A., 214 Great Dover Street, London, S.E., from whom a copy of the bills of quantities and form of Tender may be obtained upon depositing the sum of £2 2s., which will be refunded upon the receipt of a bona-fide Tender.

Copies of the plans will also be deposited with the Clerk to the Guardians, Union Offices, St. Mary's Square, Lichfield, for the inspection of persons proposing to Tender.

Sealed Tenders, endorsed "Tender for New Casual Wards," upon the forms supplied by the Architect, must be delivered at the Union Offices aforesaid on or before

FRIDAY, the 27th day of July, 1900, at TEN o'clock A.M. and no Tender will be received later than the time named. The Guardians do not bind themselves to accept the lowest or any Tender.

By order of the Board,
JOHN DERRY,
Clerk to the Guardians.
Union Offices, Lichfield,
June 1900.

COUNTY BOROUGH of CARDIFF.

The Corporation of Cardiff is prepared to receive TENDERS for the ERECTION of NEW LAW COURTS and NEW TOWN HALL at Cardiff.

Forms of Tender and bills of quantities can be obtained from the Town Clerk, at the Town Hall, Cardiff, on payment of Ten Pounds for each copy, for which a receipt will be given, and the drawings can then be inspected at the Town Clerk's Office, or at the Offices of the Architects, Messrs. LANCHESTER, STEWART, & BICKARDS, No. 1 Vernon Place, Bloomsbury Square, London.

The contractor will be bound by the contract to cause all hand-dressed stone (except granite and marble) to be executed on the site of the contract.

He will also be bound to pay the rates of wages, and to observe the hours of labour and the rules imposed by the respective trade unions and employers in the Town and District of Cardiff.

The deposit of Ten Pounds will, after the Corporation has come to a decision upon the Tenders received (but not before), be returned to the Tenderer, provided he shall have sent in a bona-fide Tender and shall not have withdrawn the same.

The Tenderer must also deliver with his Tender (but in a separate sealed envelope) his copy of the bills of quantities fully priced out and moneyed out in detail, and signed on the summaries thereof. The bills so delivered will be returned unopened to unsuccessful Tenderers. The bills delivered by the Tenderer or Tenderers whose Tenders may be accepted will have to be approved by the Architects, and copies of same will then be prepared, and be deposited to form schedules of prices for the valuation of any variations.

The Tenders must be delivered in the envelopes provided for the same (duly sealed), accompanied by the bills of quantities before referred to, and delivered to the Town Clerk not later than TWELVE o'clock noon on the 30th day of JULY 1900, after which time no Tender will be received.

Any Tender not made in the form supplied will be rejected.

The Corporation does not bind itself to accept the lowest or any Tender, and reserves the right to consider the Tenders submitted for the two buildings independently.

The contractor will have to execute a formal contract, and to enter into a bond with sureties for the due performance of the works. Draft contract and bond can be inspected at the Town Clerk's Office, or at the offices of the Architects.

J. L. WHEATLEY,
Town Hall, Cardiff,
June 1900. Town Clerk.

An Architectural Causerie.

The Wrong System.

PERHAPS the more skilled and competent the artist, the less he is inclined to

be satisfied with his work. It has been aptly said that "it requires no small degree of ability to know when to conceal it." Like other professions, there are a number of perfunctory men who practise architecture, and they are generally the most satisfied with results. They have the tact to lay any blame that may attach to their work on the shoulders of others—perhaps on the "cheese-paring" closeness of their clients, on the scamping builder, or on any other cause than the true one. They are clever, too, in minimising defects—even trying to persuade themselves and others these are merits rather than faults—and we know of one individual who had this trait so largely developed that he would shrug his shoulders and say: "Well, really, the builder's way is better than mine." The fact is, his knowledge of a rational or reasonable way of framing a joint, or his selection of a material, was somewhat doubtful or "misty," and what he specified or drew was more from custom or habit than from knowledge. But the man who has learned his profession and the motive for doing things—who has a definite knowledge of his business, not a hazy or nebulous one—immediately and quickly discovers little errors in design or execution, or finds out how much he could have improved this or that detail if he had his opportunity over again. Owing to the hurry of modern building operations, it is impossible for the most omniscient mind to take cognizance of every detail. Were it not for the modern contract system the architect might leave many of his details to be designed or arranged for during the progress of the work; he could design his stone or brick features on the building; his mouldings would be all decided on when they were wanted, and the numberless internal fittings could be arranged to meet the requirements of the client, whose opinions would be more likely to be matured when the building was nearly completed. These developments of detail from the building during its progress are almost impossible under the present system, and the architect must see precisely and accurately the end from the beginning.

X.

Disappearing City Churches.

THE coming generations will have a grievance against us, there is no doubt, for we have for the last thirty years been active in destroying the churches for which the City of London was long famous; and if there have been those among us who have secured the preservation of some of the

more remarkable of the threatened buildings, they do not serve to purge this generation of its sins in this direction. A period of great activity in the destruction of Wren's City churches set in with the opening of the '70's. In 1872 the beautiful little church of St. Mildred-in-the-Poultry was destroyed and its site sold to the Gresham Assurance Company, whose huge building now stands there. St. Mildred's was at once the smallest and the most sumptuously appointed of all Wren's churches, and was of special architectural interest. There was at one time some prospect of its being re-erected in the country, for a gentleman who chanced to hear of the

architecture. Allhallows, Bread Street, in which Milton was baptised, was pulled down ruthlessly in 1878. St. Matthew, Friday Street, shared the common fate in 1886, and in the last days of the same year the adjacent church of St. Mary Magdalene, Old Fish Street Hill, was burned down, its ruins being afterwards cleared away and the inevitable warehouses erected on the site.

Since then many minor churches have gone—St. Michael's, Wood Street, St. Michael Bassishaw, St. Olave, Jewry, and whose other names do not for the moment occur to one. Hawksmoor's noble church of St. Mary Woolnoth, Lombard Street, had

ST. BARTHOLOMEW'S, MOOR LANE. DRAWN BY C. G. HARPER.

stones being sold by auction purchased them, and caused them to be conveyed to his park near Louth, in Lincolnshire, with the intention of rebuilding them to serve as a private chapel. This intention was never carried out, and the stones are still decaying in a neglected heap. In 1874 the wreckers were again at work, for in that year the little church of St. Martin Outwich was pulled down and its site thrown into the roadway of misnamed "Broad" Street. In the same year St. Antholin's, Walbrook, a particularly interesting example of Wren's designing, was sold by auction and carted away as rubbish. The year 1876 was notable for the destruction of the churches of St. Dionis Backchurch and St. Michael Queenhithe, this last a particularly pleasing bit of

a narrow escape from destruction when the City and South London Railway scheduled it for their station, and only the most determined opposition saved the building. St. Mildred, Bread Street, was scheduled in the City and West End Railway Bill of 1897, and had not the Bill itself failed would probably have been demolished. News now comes that two more churches are to go, those of St. Bartholomew, Moor Lane, and St. George, Botolph Lane. Neither, perhaps, is to be regretted from the purely architectural standpoint, but one of them has a curious history. St. Bartholomew, Moor Lane, was originally St. Bartholomew-by-the-Exchange, and stood at the corner of Threadneedle Street and Bartholomew Lane. It was injured in the Great Fire of London and

repaired by Wren, remaining on the same site until 1845, when road-widening caused its removal. The Sun Fire Insurance building stands on a portion of the site. Cockerell rebuilt it almost stone for stone on its present site in Finsbury; but now that the newly-formed parish of 1845 has changed its character from that of small house property to warehouses a place of worship is no longer required, and the parish has been amalgamated with St. Giles's, Cripplegate. St. George's, Botolph Lane, has long been neglected and insanitary, and will be destroyed and the parish united with that of St. Mary-at-Hill.

In this connection it is curious to observe that although one very loudly expressed reason for these unions of benefices is that their incomes may be used for providing urgently-needed places of worship in the suburbs, yet the old stones of the destroyed churches are never, or rarely, used for rebuilding in Suburbia, but are allowed to be sold to the first contractor who bids a reasonable price. A curious result of these unions of the City parishes and the removal of the monuments from the destroyed churches to those which represent them is that some of the surviving buildings represent six or eight vanished edifices and are crowded with alien memorials. How the future historian is to succeed in unravelling this confusion is a nice question! The fine old church of St. Helen's, Bishopsgate—the "Citizens' Cathedral," as it has been aptly named—represents many such forgotten churches, and is rich in memorials from them—memorials of City worthies whose names are for ever bound up with London's roll of honour. C. G. H.

Central School of Arts and Crafts.

WHOEVER visits the school while the exhibition is open may be profitably employed either in forming appreciations of particular works or in thinking on his own account about the gross value of such exhibitions. There appears to be no age limit here as in the other schools, and the fact may account for some examples of craft appearing to be so good, and others by comparison poor. A class to be considered apart is that of designers in general, for if they were engaged as designers elsewhere they would hardly be here as students. The standard in this department has been raised by the proficiency of the workers, and since their designs as a rule are so good it seems to be rather a pity that they are not applied at once to the purposes for which they are intended by students in other classes, so that one might judge the work by the effect of the whole and apportion the praise accordingly. It may be that stone-masons and plumbers are learning in Regent Street what loveliness may be elicited from the materials wood and stone, but there is no clay-craft that I know of, and the students of modelling here constitute a class by themselves like the designers already mentioned. They are mostly employed during the day in houses producing works which would be better for being artistic, but while engaged in this way have little or no opportunity of expressing what feeling for beauty they have. Is it likely if they had nothing of this that they would be so eager to attend these classes at the end of a long day's work? The teachers agree that a talent for design is probably latent in all who have learned to understand and respect the material, and of the truth of the observation there would seem to be no doubt whatever. As it is with sham jewellery (gold that is not gold, &c.), so is it with a great many other things. They have no actual value and there is simply no limit whatever, excepting what Nature has set, to the amount that may be displayed in the shops, and these baubles are Mammon's playthings. E. R.

On Reflection.

Vulgarising the Acropolis.

READERS of Sir Walter Besant's romance, "The Golden Butterfly," will remember the sad case of Mr. Gilead P. Beck, millionaire, who endured much perplexity and embarrassment in his efforts to dispose of his vast fortune in such a way as to benefit humanity and gratify his own benevolent impulses. We learn from the "Methodist Times" that the fictitious Mr. Gilead P. Beck has his counterpart in real life. Mr. Hugh Price Hughes knows a millionaire who is in the same parlous case; he has £40,000,000 which he wishes to spend wisely before he dies, but, in spite of his most strenuous efforts, he cannot spend his money fast enough—the millions grow in spite of him, and, as Mr. Hughes says, "the case is both serious and urgent." It is not, however, quite hopeless, for Mr. Hughes has a scheme which, if carried out, will enable his millionaire to shed at least one of his superabundant millions. Let him invest it in the restoration of the Acropolis at Athens, and by so doing he will—in the opinion of Mr. Price Hughes—"render an unparalleled service to classical education and the noblest act," and at the same time build for himself "a monument which will endear his memory to all civilised men as long as the world lasts."

Not a Joke.

As we begin to read about Mr. Hughes and his millionaire, we are inclined to regard the matter as a joke; but we soon find that the writer is in deadly earnest. He invites criticism, and threatens on a future occasion to enter into details with regard to his scheme. Now, with every desire to make allowances for a reverend gentleman making an excursus in unfamiliar paths, we cannot but feel some surprise that, after all the failures that have been made by the radical school of restorers, after all that has been said and written on the subject by the greatest of art teachers, any educated man should be found to suggest an enterprise so futile and so essentially vulgar as the wholesale reconstruction of the Acropolis. The glory of these ancient stones is not only in their beauty, but in the story they have to tell of a great people—the supreme artists of the world—and of an heroic age long passed away. Restore, rebuild, copy, side by side with stones that have stood for more than 2,000 years, place others fresh quarried, cut by machinery, and erected by inartistic and unsympathetic hands, and you eliminate all the dignity, the picturesqueness, the poetry, the romance that have made Athens the Mecca of the artistic world. Mr. Price Hughes thinks the restored Acropolis will attract a greater number of visitors. Possibly; the new Athene Promachos might—if well advertised—prove as great a draw as the Eiffel Tower or the Big Wheel at Earl's Court; and in the new Parthenon crowds of "personally conducted" Philistines might manifest a languid interest in the exact cost in English pounds or American dollars of the gold ornaments (or

would they be gilt?) on a chryselephantine statue of the Virgin goddess, which would have about as much right as the figures in a penny waxwork show to claim kinship with the works of Phidias.

No Help to Education or Art.

How the cause of Education or of Art would be advanced by such an outrage on good taste we are at a loss to see. The student who wishes to know what the Acropolis was really like can study models of it in museums. But something, surely, may safely be left to the imagination. How grotesque are the incongruities which Mr. Hughes's scheme conjures up. Standing in the midst of the Acropolis the visitor will be told that what he sees owes its existence to the public spirit of Pericles and Mr. Andrew Carnegie; he will be asked to admire the Propylæa as the joint effort of Mnesicles and some highly respectable Fellow of the R.I.B.A., and in the Parthenon the work of a posse of modern decorators will claim attention along with the masterpieces of Phidias. Many years ago the temple of Nike Apteros, which the Turks had converted into a battery, was re-erected from the original materials; but that is a very different matter from the restoration which Mr. Hughes contemplates. We would recommend Mr. Carnegie to reserve his millions for some worthier object, and Mr. Hugh Price Hughes to devote his energies and his eloquence to those more useful causes with which his name has been associated, leaving the care of the Acropolis to those who love and reverence its splendid ruins, and realise more clearly their value to mankind. Both he and others may well take to heart the words of John Ruskin—almost the last he wrote on any public question—"Do not let us talk then of restoration; the thing is a lie from beginning to end."

The L.C.C. Works Department.

THE London County Council Works Department has again to face the public with a heavy loss. Since the inception of the Department the works carried out by it have cost the ratepayers £64,539 more than the estimates, and this is a heavy price to pay for the principle of direct employment. The various excuses put forward, not by the Department but by its supporters, are on the face of them absurd. If, as one member explains, the increased cost is due mainly to extra works, the manager would certainly have put down the sum as for extra work, and not admitted it as a loss on the original scheme. To blame the estimating is equally beside the mark, for we have evidence that contracts refused by the Department have been executed by private firms considerably under the estimated cost. The real reason is much more likely to be that complained of in one of our American contemporaries—namely, that while wages are greatly increased the amount of work done is very much smaller. No blame we think attaches to the manager, who appears to be a capable and cautious man, and whose explanation of the Crossness Sewer loss everyone will accept. The loss on the Housing Scheme is a very serious matter, for either the rents will be beyond the intended tenantry or the work must be paid for out of the rates. With their present burdens, and their own difficulty in finding houses, the middle-class absolutely cannot afford to house their poorer neighbours.

BARLEY VILLAGE.

THE village of Barley lies on the fringe of Hertfordshire, with Essex for its eastern border and Cambridge for its northern. The parish (2,725 acres in area) is roughly divided into two portions, each consisting of high ground rising from 300ft. to nearly 500ft. above the sea level. The village itself consists (as it has done since its earliest days) of a group of "ends" clustered round the Cross Hill and the parish church.

The long life of the ancient village, or "town," as it was always called, closed the last of its eventful chapters with the Private Enclosure Act, which passed into law in the year 1819, followed, as it shortly was, by the New Poor Law. The village of to-day dates from the time when these two legislative measures came into working; what of old parochial life the former had left (and it was but a weak and stunted plant) the abolition of self-government, consequent on the formation of Union Districts, completed.

Passing over plain indications of a Danish occupation, the great and lasting impress upon the village story has been made by the Romans and the Britons. The northern boundary of the township was formed by the famous Ichnield Street, or highway of the Iceni, one of the four British intertribal trackways which formed the bases of the Roman military roads; while another of them—the Ermin Street—is only removed, if removed at all, a little way from the western boundary.

From Court rolls and old MSS. and maps in the British Museum and the Record Office it has been possible to bring to light no fewer than nine other Roman roads which, with lesser connecting ways, surround the village, and to prove beyond question the existence of Roman colonisation and the full occupation of the Romano-British agriculturist. Almost everywhere under the crowns of the many hills, on every commanding ridge, are to be traced evidences of the way in which the Romans made themselves at home and settled as colonists in the newly acquired territory which the legions had added to the empire and the road-makers had opened up for commercial as well as for military purposes.

There were the square or rectangular land holdings, sufficient for the maintenance of a family, together with a few larger estates; while in the "Champion" (an open plain) may still be traced earthworks and camps, with their sectional ways and gates at the cardinal points of the compass; also the *botontini*, or little hillocks of earth, marking out the boundaries, with ashes, dust, and potsherds underneath. And altars and votive tablets (see illustration) are not lacking. A figure of Mars

FIGURE OF MARS FOUND AT BARKWAY.

THE WELL-HOUSE: "WAGGON AND HORSES" INN. DRAWN BY ALEX. ANSTED.

(illustrated) was found in the neighbouring village of Barkway, in 1743, near a hill on which there still exist evident traces of Roman occupation. The image is of bronze, while the tablets or engraved plates are of silver-gilt, seven in number, containing figures of either Mars or Vulcan. They are now in the British Museum. The inscriptions show that they belong to the reign of Diocletian, which fixes the date near the close of the third century. Besides fragments of Samian ware (real and imitation), black, brown, and other coloured ware, Mortaria, glass, tiles, flue pipes, and numerous bones, a considerable number of Roman coins, of various reigns, are from time to time brought to light in the course of agricultural operations.

As regards ancient buildings, Minchin Bury (see illustration) may well be given as an ancient homestead or bury (the chief's or lord's house). The tithe-barn, with its oak pillars, roughly hewn, but forming part of a careful architectural design, probably dates back to the tenth century, when the estate was given to the newly-founded Convent of Chatteris. The timber of the pillars is formed of oak trees cut, beyond doubt, from the ancient wood which once came down to the southern border of the homestead, and placed *in situ* with the root end upwards.

Of the parish church as it existed in 1870 nothing now remains except the tower and the south aisle. The former is Norman, with traces of the incorporation of earlier Saxon style, rebuilt probably by one of the Scales family on his return from the first crusade. It is dedicated to St. Margaret, virgin and martyr of Antioch in Pisidia. And a fresco on the east wall of the present church commemorates the

"daisy of Paradise and pearl of the heavenly city, with her dragon, feminine counterpart of St. George." The nave, which was practically reconstructed at the restoration in 1871, of which the old arcade remains, was built on to the Norman tower in the fourteenth century, while the south aisle belongs to the fifteenth century. The present chancel is altogether modern. Chauncy tells us that "this church is situated in the middle of the vill, within the Diocese of London, upon a rising ground in the vale, and hath two fair isles divided from the body, covered with lead." In the middle of the last century, according to the testimony of the Rev. W. Coles, "the tower, containing five bells and a sanitas or saunce bell, was surmounted by an extraordinary high and elevated tower of lead." This disappeared at the beginning of the present century, as also did "a neat screen separating the nave from the chancel."

In 1871 the whole building, with the above exceptions, was rebuilt after designs of the late Mr. Butterfield, the style chosen by the architect being the geometrical middle pointed. A drawing is given of the village street, showing one of the old inns. The street itself contains about a dozen ancient houses, which originally formed the homesteads of the farmers of the old village. The inn, now the "Fox and Hounds," was formerly known as the "Black Swan," the sign being a shield suspended from the cross beam, which now supports the fox,

VOTIVE TABLET.

THE "WAGGON AND HORSES" INN, BARLEY. DRAWN BY ALEX. ANSTED.

dogs, horses, and huntsmen. It was a favourite house of resort of James I. (who used to ride over from Royston), as also, so tradition says, of the renowned highwayman, Dick Turpin. There is another ancient inn, situate on the Cross Hill, the "Waggon and Horses." Here in days gone by stopped four coaches to and from London and Cambridge, the road through Barley being the old north road to King's Lynn. An illustration is given of the old well, deep sunk in the chalk, which was attached to this inn, and which remains till this day as it existed in the "spacious days" of good Queen Bess.

The Town House, or Guildhall, opposite the church, was rebuilt by Dr. William Warham (afterwards Archbishop of Canterbury), rector 1495-1503; he added a free school, which he endowed. The ancient building was used as a school from 1530 to 1895, when new schools were built. It is still used for parochial purposes and technical classes. The front upper windows are modern.

Besides other ancient buildings and parish lands Barley still keeps and uses its Playstowe, or "Playing Fields," dating from times beyond Domesday. The Rectory House has been much enlarged, and practically rebuilt from plans by Salvin (1834). It is a handsome building, Elizabethan in style, and said to be one of the finest rectory houses in the county.

COLOUR IN ARCHITECTURE.

By A. TROYTE GRIFFITH.

(Continued from page 403, No. CCLXXXII.)

Mediæval Decoration.

(The value of stained glass.)

Though the remains of contemporary paintings and coloured decorations in mediæval churches are less scanty than those of the

Hellenic temples, yet so disastrous have been the results of religious prejudice, long neglect and careless restoration that it is nearly as difficult to conjure up the colour effect of a vaulted cathedral as of Doric peripteros. The extent and systematic methods of mediæval colour decoration are often greatly underestimated, and Gothic architects have been accused of perpetrating barbarisms of colour on very insufficient grounds. They should not be blamed for the harsh contrasts of stained glass with the cold tones of stone and plaster, nor for the somewhat crude effect of mediæval decoration seen under the glare of white light. The fact is that mediæval artists combined coloured glass with coloured walls to give one harmonious polychromatic effect. Coloured glass was seldom used without some other colour decoration, and the latter often comprised not only walls and roofs, but also piers and arches, mouldings and ornaments, screens, fonts, and all the fittings and furniture of the church. The conjunction of coloured glass with realistic painting is doubtless a barbarous method of decoration. This, however, was not a fault of mediæval artists, but has been left to nineteenth century painters. Moreover, another freak of Gothic revival decorators has materially assisted to bring the decoration of churches into contempt. It is unnecessary to mention instances, but everyone can call to mind churches in which the wall surfaces are emphasised with elaborate diapers and outline paintings—in colourless colour—red and black (with perhaps a touch of light blue) on buff grounds; while important constructional members are left in cold stone—the utter destruction of any architectural significance. But to return to a more pleasant subject.

Although traces of monumental painting are exceedingly scarce before the end of the eleventh century, we know that the churches of northern Europe were plentifully decorated, the severe, not to say bald, nature of the architecture giving ample scope for surface decorations in localities where mosaic and marble were unobtainable. For instance, Viollet le Duc states that all Gallo-Roman monuments between the fourth and eleventh centuries were painted inside and out.

Some idea of the prevailing style of decoration in Romanesque architecture in England

THE "FOX AND HOUNDS" INN, BARLEY VILLAGE. DRAWN BY ALEX. ANSTED.

THE TOWN HOUSE, BARLEY. DRAWN BY ALEX. ANSTED.

may be obtained from the walls and arches of St. Alban's Abbey. The colours used are red, yellow, buff, white, and black. The patterns are of the simplest description—rings of painted voussoirs, chevrons, brick patterns, and rudely executed wall paintings of an elementary character.

A more perfect example, though on a minute scale, is the little church of Kempley, in Gloucestershire, a Norman building of the twelfth century. The decorations formerly covered the whole interior, but those in the chancel alone are sufficiently well preserved to allow description. The chancel, which measures only 15ft. in width by 13ft. 6in. in length, is roofed with a plain barrel vault, springing directly from the walls, without cornice or moulding of any kind. The whole of the walls and vault are still covered with tempera paintings, with the exception of the portions near the floor where the plaster has decayed. These paintings form a complete scheme of decoration contemporary with the building. The centre of the vault is occupied by a figure of Christ enthroned in glory, surrounded by the symbols of the four Evangelists, arch-angels (St. Michael weighing souls), seven sacred candlesticks, St. Peter, and other figures. The interstices of the composition are filled in with sun, moon, and stars of fantastic shapes. On the side walls are painted figures of pilgrims, and the twelve Apostles seated beneath canopies; while the east wall is also decorated with figure subjects. The chancel arch and jambs of the windows have simple repeating patterns. The ground of the whole composition is a strong crimson-red, and the predominant colour of the figures is yellow or buff, touched up with greens, blues, and greys, and bold red or brown outlines. Though the figures are decidedly archaic in drawing and colouring, the decorative effect is good. While the artist conformed to traditional Byzantine methods, he permitted himself a pleasing license in the shapes and features of the heavenly bodies, the green nimbus of the bull and the angels being not unworthy of Blake himself.

Decorations of a similar style, though perhaps of more perfect execution, may be seen at St. Savin, the Château de Coucy, and elsewhere in France. At Coucy should be noticed the admirable effect of white and black lines and spots in enforcing the simplest schemes of reds, browns, and yellows.

Unambitious decorations of this description were found satisfactory both in England and on the Continent during the Romanesque period. The Byzantine mosaics were still the highest form of the pictorial art, while the artistic energies of the northern nations were principally directed towards the development and improvement of architecture.

However, colour was about to bewitch men's senses in a new material that had the most surprising effects on architecture itself. This was, of course, stained glass, which, though known to the Romans and already used in a different manner in the East, was now coming

into general favour in Europe. (The earliest existing stained glass, as we use the expression, is in the Cathedral of Augsburg.) By the middle of the twelfth century in France and the beginning of the thirteenth century in England coloured glass became of the first importance as a decorative material. Besides the direct influence on the architectural design, it exerted a secondary effect of considerable importance on the polychromatic decoration of churches.

The new method of decoration, by transmitted instead of by reflected coloured light, was a factor of the greatest value in the development of architecture. For though the gradual growth of Gothic architecture cannot be ascribed to any single cause, yet the most noticeable change was the contraction of wall spaces and enlargement of window openings. To such an extent was this carried that in the Abbey Church of St. Denis in France and elsewhere even the triforium was glazed, the mullions being carried up into the clerestory.

The wall surface has here practically disappeared, the piers and vertical members only being required to carry the vault and frame the windows. Never before or since has the desire for colour acted with such overpowering strength on architectural design.

Though in England the enlargement of window openings did not arouse such daring feats of construction as Beauvais or St. Denis, yet the magnificent square east ends of York and Gloucester are directly ascribable to the same cause. And in late Perpendicular work the width of the window opening became the gauge of the whole system of panelling which covers what remains unglazed of the walls of such buildings as King's College Chapel.

The Romanesque schemes of simple colouring were soon found to be quite inadequate by the side of brilliant glass pictures. A greater variety of colours was wanted, and it was proved by experience that blue was the colour that "tells" most, in large masses, when brought into direct competition with coloured glass. For this reason blue, heightened with gold stars, was often employed for painting the compartments of vaults. This treatment involved a greater strength of colour on piers and arches than had hitherto been usual. Viollet le Duc writes in this connection:—"It was absolutely necessary that the constructive forms, which are of such importance, in the buildings of the thirteenth century should be strongly emphasised by the system of colouring. For instance, the adoption of blue, studded with gold stars, for the grounds of vaults, compelled an equally strong arrangement of colours on the ribs and bosses. In these positions gold was of great value, and black outlines to vivid shades of reds and greens. When the painting of the vaulting ribs had been brought up to this pitch, colouring equally brilliant was required on the piers and mouldings by which they were supported, particularly as the irradiation from the windows tended to weaken their effect. Thus all supporting members which form the skeleton and nerves of the building stand out with strength and brilliancy. The grounds, on the contrary, are soft and low in tone."

Although it is impossible to point to any such complete scheme of mediæval colour decora-

INTERIOR OF MINCHIN BURY BARN, BARLEY. DRAWN BY ALEX. ANSTED.

tion in England, sufficient fragments remain to justify this ideal. The wooden vaulted roof of the choir of St. Alban's Abbey is an instance in point. The ground colour of the vaulting compartments is a greyish blue, probably considerably faded. In each compartment is a large foliated circle alternately red and green, the leaves marked and outlined with brown edgings of a strength sufficient to tell without becoming noticeable as colour. Each red circle encloses a sacred eagle with green nimbus, and each green circle an Agnus Dei with red flag and red nimbus, an example of that alternation of colours so frequent in Gothic colour decoration. The ribs are painted red, white, and black, with barber's pole pattern and powderings and the bosses red and gold. Shields painted in heraldic colours are fastened to the springings of the ribs. Imagination must complete the scheme on the stonework, as, beyond one or two figures now nearly perished, few traces of colour remain. The colour decoration here would be of the greatest value in har-

tions of mediæval churches, but also the fittings and furniture, whether of stone or wood, were freely decorated with colour. In Westminster Abbey very many of the tombs seem to have been originally painted and gilt, and at Tewkesbury Abbey the majority of the chapels and monuments have traces of the ancient colour decoration. The best preserved of these are the sedilia, in which the original colour scheme can be seen throughout. The delicate mouldings of the piers are painted green with red in the hollows, the vault red with green ribs, the carving all gilt with red grounds, and the backs are diapered with elaborate repeating patterns in various colours. The gilding of carved work is frequently found, both at Tewkesbury and elsewhere, and it is worthy of notice that the mediæval decorators seldom, if ever, applied gilding to a flat surface, but portions to be gilded were first modelled up in gesso or plaster.

At Hereford Cathedral may be seen a particularly fine example of a painted stone screen.

This divides a small oratory and chamber above from the Lady Chapel; a considerable effect of life and lightness is obtained by the barber's pole ornament and the ingenious counter-changing of reds and greens in the mouldings of alternate panels. It is difficult to understand how any cultured eye can tolerate the stiff forms of late Gothic work in cold stone or wood while such examples as this screen and many painted roofs bear unmistakable testimony to the intention of their originators.

Italian Colour Decoration.

(*Mosaics and Constructive Colour. Decorative Painting.*)

In considering the use of colour in connection with mediæval architecture no reference has yet been made to Italian decorative work. The importance of this school as the forerunner of the modern school of painting can hardly be over-estimated, though, as a precedent for modern ecclesiastical work, the colour decorations of England and France may be of more direct value. And constructive polychromy has never been carried out so extensively and so systematically as by the Italians of the thirteenth and fourteenth centuries.

Constructive polychromy naturally divides itself into two branches—the constructive use of variously coloured stones and marbles, and the facing or incrustation of a commoner by a more beautiful material.

A frequent instance of the first method is the use of coloured marbles or of stone and brick, in strongly marked horizontal courses, for the general walling. At S. Zenone, in Verona, red brick and warm stone are used in alternate bands. The brick bands are of varying depth, containing one, two, three, or four courses, while the stone bands are nearly uniform throughout. In many cases, as for instance the west front of Lucca Cathedral, is found the less effective method of covering a whole façade with bands of equal width. This arrangement of the courses becomes more telling and less monotonous when confined to a part only of the wall, as the gable or the wall below the cornice, or to emphasise some special feature,

as in the porch of the Cathedral of Pistoia. Another type, again, is found at the Frari Church, in Venice, where the dark-coloured bands are used only as string-courses to mark the springings of windows and other important architectural lines. It is difficult to form a correct judgment of the value of this method of decoration. Under a Northern sky the parti-coloured stripes might be too prominent, but under the brilliant sun of Italy they would probably fall into a due subordination to the whole scheme.

The combination of brick and stone to give colour to window openings and arcades is often found at Verona, Mantua, and other towns of Northern Italy. Labels are omitted, and their place is supplied by narrow red bricks; voussoirs of stone and brick are alternated, as at the Vescovato, in Mantua; stone soffit cusps are introduced into brick arches at Venice and Verona. In all these cases the stone is used as a rare and precious material, its value enhanced by contrast with broad masses of commoner brickwork. Marble and mosaic pavements need only be mentioned here. Though these are more often found in Italy than in other countries, beautiful coloured pavements have been associated with all great architectural epochs.

The second method of marble incrustation has the disadvantage of being less permanent and less constructive. But with reasonable care the former objection may be obviated, while, if no attempt is made to imitate wall construction, marble may be used as a lining no less legitimately than plaster or panelled wood. By fixing the marble in long vertical slabs, all deception is avoided, and natural patterns of great beauty may be obtained by reversing the slabs sawn from the same block. Marble was thus used in Italy, from the time of the Byzantine buildings of Ravenna as a simple base to more elaborate decorations, and in later periods a more extended use was made of this method of decoration. The mosaics themselves may be considered as a connecting link between constructional and superficial decoration.

In the consideration of Classic decoration no reference was made to the use of mosaics. Although these have been distinguished by Latin names of little descriptive utility, they can be divided roughly into two main classes: marble mosaics used by the Romans for floors, and glass mosaics used by the Christians on walls and vaults. Other varieties of mosaics may more reasonably be classified as inlays.

The origin of the art of mosaic is as uncertain as the derivation of the word itself. The Greeks appear to have made only an occasional use of this form of floor, probably preferring the greater breadth of marble paving. The Romans, on the other hand, after acquiring the art from the Greeks, carried it to the confines of their empire. Not only conventional patterns, but portraits and copies of historical pictures, have been discovered in the remotest districts to which Roman civilisation had penetrated. A well-known example is the elaborate battle of Issus at Pompeii. In pavements such as this the conventions of paintings were inartistically transferred to an uncongenial material, while the figures simulating high relief were equally unsuitable for the decoration of floors. The chief interest of these elaborate figure mosaics is rather archaeological than architectural, in the glimpses afforded of the compositions of Hellenic painters.

In the reign of the Emperor Constantine, the Christians, now free from the danger of persecution, were enabled to erect openly in Rome buildings for religious worship. The earliest Christian basilicas have been destroyed, but in buildings of the fifth century, as St. Maria Maggiore at Rome or the tomb of Galla Placidia at Ravenna, the large wall spaces and bare vaults, devoid of architectural detail, invited colour decoration. This demand was satisfied by the application of mosaics to the upper portions of interiors, with marble paneling below.

The traditions of Classic art may still be traced in the mosaics of the Chapel of the Empress Galla Placidia, built at Ravenna about 450 A.D. This is a building of consider-

BARLEY CHURCH.

monising the wooden vaulting with the more solid stone of walls and arcades.

A different treatment is found on the flat ceiling of the sanctuary, which was not brought into such direct competition with stained glass. The ceiling is divided into square panels separated by moulded ribs. The panels contain alternately monograms and angels bearing heraldic shields. The ribs were painted in red and black, as in the presbytery, but the ground colours of the panels are here red and grey. The heraldic devices on the shields required a considerable range of colouring, which perhaps detracts from a general harmony of effect. The successful use of a broken white in the scrolls, faces of angels, and monograms is noticeable, as well as the rich effect of a red leaf pattern laid direct on the blue ground of some of the monograms.

Not only the walls and constructional por-

able interest in the history of art as the first example of a domed construction rising from four supports. The plan is cruciform; the four arms of the cross are vaulted with plain barrel vaults, springing from a simple cornice, and the crossing is surmounted by a small cupola, whose base is circumscribed round the supporting square. The building is lighted by four small windows in the cupola and a window in each end wall. The vaults, cupola, and semicircular end walls above the cornice are covered with the original mosaics, the walls below having been formerly lined with marble slabs. The ground colour of the mosaics is everywhere a dark blue. The cupola is powdered with gold stars and the symbols of the Evangelists, and on each of the four walls are two figures of saints in white garments standing at the sides of the windows. The figures are feeble imitations of Classic designs, but the white masses are valuable as a connecting link between the light of the window and the subdued tones of the general decoration. The arches supporting the cupola and the jambs of the windows have meanders and patterns of good design. The barrel vaults of the long axis are closely diapered with gold rosettes and stars on the dark blue ground, and the vaults of the short axis with an even more beautiful scroll and acanthus pattern. On the semicircular end walls stags drink from pools bordered with rushes and embowered in thickets of acanthus. In all these decorations great effect is obtained from the use of deep red borders separated from the blue by white lines, and light blue patterns laid direct on the dark blue ground. This blue, a shade of great beauty, pervades the whole composition, and brings the different parts into complete harmony. The tradition of Classic art remains in the decorations in spite of the Byzantine methods of plan and construction.

The semi-Oriental influence of Byzantium, which began to react on Italian art in the reign of Justinian, was naturally felt most strongly at Ravenna. The mosaics of S. Vitale and S. Apollinare Nuovo, in the sixth century, are typical examples of the Byzantine style. Gold grounds take the place of the white and blue of earlier works. The proportions of the human figure are incorrect, the attitudes stiff, and the features devoid of expression. This debased style continued generally in Italy until the twelfth century, when new ideas, Norman and Arabian, were brought to bear on the art in Sicily. In the Capella Palatina at Palermo (about 1140 A.D.), and in other churches, the old Byzantine stiffness is somewhat relaxed, and the general colour effect is of the utmost magnificence. An improvement of the Italian mosaics generally may be noticed in the work of this century, as at S. Clemente in Rome and other churches too numerous to catalogue. As late as the commencement of the fourteenth century mosaics remained the national method of decoration in Italy. After this time the art gradually fell into disuse, though the ancient tradition was still continued in St. Mark's at Venice. The work of Cimabue in the Cathedral of Pisa (A.D. 1301) may be considered the last of the genuine school of mosaic. It is true that at a later date mosaics were executed from the cartoons of eminent painters, but whatever interest these may have as a new phase of pictorial art, as decorations they need not be considered.

It was natural that Italian mural paintings of the commencement of the fourteenth century should be affected by the Byzantine traditions of the mosaic decorations. In the paintings of Cimabue, who had himself worked in mosaic, this feeling is strongly marked. On the ceiling of the Church of St. Francis at Assisi he employed the gold grounds and ancient patterns of the less sympathetic material, and in later works Byzantine influence is still shown in wooden draperies and expressionless features. Giotto, the pupil and assistant of Cimabue at Assisi, first showed the possibilities of the new method. The comparative facility of execution and superiority of effect obtainable by fresco painting soon led to its almost universal adoption for mural decorations.

The Arena Chapel at Padua, decorated by Giotto between 1303 and 1306 A.D., was one of

the first examples of fresco on a considerable scale. The chapel consists of an oblong nave with an apsidal chancel and a sacristy on the north side. The semicircular barrel vault rises from the walls of the nave, with no cornice or intervening moulding. Six lancet windows on the north side of the nave, and a triplet window in the west gable, light the interior in the most effectual manner for the purpose in view—namely, to show the paintings to the best advantage. The exterior is correspondingly plain. The central portion of the vault is painted blue, with gold stars and medallions containing figures on gold grounds. The walls are divided into three horizontal bands of pictures, separated by painted borders, the lowest in monochrome, the two upper in brilliant colours on a blue ground. The majority of these paintings are from the hand of Giotto himself. The painter has completely relinquished the old Byzantine traditions, no less in the details than in the general composition of the paintings. The horizontal rows of pictures, so opposed to the vertical tendencies of Gothic architecture, the subordination of accessory details to the principal figures, and his naturalistic though dignified compositions all prove the originality of the painter's genius. Of this building Street remarked: "The architectural merit of the building is simply, I think, that it performs satisfactorily the office of giving ample unbroken surfaces of wall for paintings." In fact, as an architectural monument, the Arena Chapel is of no importance whatever; but as a landmark in the history of art it represents a change of the first importance, in painting itself as well as in its relation to architecture. Painting is no longer subordinate to architecture, and for the first time takes a place of its own. It still acknowledges and therefore decorates the wall, but the time is not far distant when it will do neither.

The later phases of decoration in Italy are overshadowed by the extraordinary development of pictorial art, from the simple conventions of Giotto and the Florentines, through the great works of Raphael and Michelangelo, to the complete chiaroscuro of Correggio. It is true that the discovery of the Classic decorations of the Baths of Titus, in the fifteenth century, gave a new impetus to architectural decoration, in the arabesque or grotesque style. Perugino and Raphael were the leading exponents of this method, their best known works being the decoration of the Loggia of the Vatican and the Villa Madama. In these grotesque decorations, the ground colour is often white or light in key; on this are painted natural and unnatural objects of every imaginable description, united by scrolls and wreaths of a conventional character. No portion of the ornament was allowed to overpower the rest, but the whole combines with a general richness and harmony of effect, in which the predominating note is given by the ground colour. So long as the master mind of Raphael directed the decorations, the grace of drawing and breadth of colouring redeemed the innate viciousness of the style. But his feeble successors were unable to continue the tradition, the great artists becoming engrossed in panel painting. The grotesque decorations were at any rate properly subordinated to the general architectural effect, a quality which the greatest admirers of Michelangelo will hardly claim for his work in the Sistine Chapel and elsewhere. With his great example, decoration now became subordinate to painting rather than to architecture. It is therefore difficult to give a satisfactory account of the decorative art of the Renaissance, apart from a general history of Italian painting, though a discussion of the just limitations of decorative painting will be most aptly illustrated by the schools of Northern Italy.

(To be concluded.)

Court of Common Council.—At last week's meeting it was decided to purchase Shadwell Market and adjoining property at a cost of £175,000. Authority was also given for the construction of a covered way, at an estimated cost of £2,000, between the Central Market and the Central Market Annexe.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Wood for Earth Work.

WALSALL.—OPTIMUS writes: "Which is more durable for outside purposes, oak or teak?—for instance, a post driven in the ground. Which timber is best to withstand rot?"

This query is hardly explicit enough, as "outside purposes" is rather too general a term. Elm is an excellent wood, and the sap in it is reckoned as good as the heart. It does not improve by seasoning, but should be used green, and even kept wet until wanted for use. Oak combines elasticity with toughness, and would be a better wood to use than teak; but an elm post would be the best in the ground.

R.I.B.A. Examinations.

LONDON, W.—STUDENT writes: "Can a person who has not been articulated enter for R.I.B.A. examinations—I mean a person who has entered an architect's office as office boy, and studied and qualified himself for a junior assistant? Please name a good cheap book on the Orders. If I cannot enter for the R.I.B.A. examinations, kindly advise me how to become an assistant without passing the Institute."

A candidate for the probationary examination of the R.I.B.A.—the first of the three progressive examinations—must fill in a form (which can be obtained on application at the Institute) giving full information of his age, education (architectural and otherwise), examinations already passed, &c. The fact of his having been articulated to an architect is not obligatory, though advantageous, but for the intermediate and final examinations it is necessary that he should be recommended as a "fit and proper person" to enter for these examinations by an architect in practice who can answer for the authenticity of the probationary work which the student submits. Chief assistants of more than thirty years of age are exempted from all but the final examination. A good book on the Orders for the use of students is "The Orders of Architecture," by Spiers; "Classic and Early Christian Architecture," by Smith and Slater, will also be found useful. If querist has had a fair training in office routine and draughtsmanship, and gained a good knowledge of practical construction, he should have no difficulty in obtaining a position as assistant; he would do well to make and keep by him some good practical drawings to illustrate his powers when applying for such a position. A. G. B.

Carrying up Walls and their Influence on Ancient Lights.

SILSDEN.—M. H. writes: "(1) To what height can the wall shown in black in the accompanying sketch (not reproduced) be built without affecting the light to the window? (2) Can the owner of the window claim the rights of ancient lights in view of the fact that the building has only been built six years and the whole site was sold in building plots? (3) In another wall adjoining it is necessary to insert weep holes to ensure the stability of the wall. This is objected to, though the water can do no damage. Is there any way of getting over this difficulty?"

(1) This question cannot be answered categorically. There is no particular height to which a wall can be raised legally without affecting the legal right of the occupiers of a neighbouring building to the access of light to a window in the latter. But the fact that 45 degrees are left unobstructed may, under ordinary circumstances, be considered *prima facie* evidence that there is not likely to be material injury. (Per Lord Selborne in *City*

of *London Brewery v. Tennant*, L.R. 9 ch. 220.) (2) No, but though the lights may not be claimable on the ground of being ancient, there may be a right to prevent their being obstructed by reason of the terms, express or implied, on which the plots were sold for building. (3) The owner of the adjoining property cannot be compelled to allow water from another plot to drain on to his land. He could maintain an action for an injunction and damages for discharging water in this way, at all events if appreciable injury were caused to the land on which it was discharged. H.P.B.

Stresses in Roof Truss.

CATERHAM VALLEY.—STUDENT writes: "I should be obliged if you would show me the

case to the corresponding lines in Fig. 1. It is possible also to work another way to find the value of 10-11—namely, by parallelogram of forces, as shown in Fig. 3, where the parts are lettered in order of construction. The rafter, *a b c d*, is there placed horizontally for convenience, and the force lines make their proper angles with it; the numbers correspond with those on Fig. 1.

HENRY ADAMS.

Pennell's Book on Pen Drawing.

SILSDEN.—TYKE writes: "On pages 251 and 252 of your issue for May 31st, 1899, you recommend 'Pennell's work on pen and ink drawing.' Please give the full name of this work, with publisher."

Messrs. Macmillan and Co., Ltd., of St.

STRESSES IN ROOF TRUSS.

reciprocal diagram of the steel roof truss shown in the accompanying sketch, according to Mr. Henry Adams's methods contained in his book 'Strains in Ironwork,' as I find a difficulty in applying the principles to this particular truss."

The truss in question forms an interesting case, because, although there is no direct means of obtaining a reciprocal diagram, as in other cases, a very slight assumption enables one to be correctly drawn. Fig. 1 shows frame diagram and Fig. 2 the corresponding reciprocal diagram. After drawing the load line 1-9 in Fig. 2, draw 2-10, 9-10, giving point 10; then draw 3-12, 4-13 and 10-11 indefinitely. Observe where the last line crosses the other two and bisect the space between; this will give point 11. From point 11 draw 11-12, and through point 11 draw 13-14, parallel in each

Martin's Street, Leicester Square, W.C., are the publishers of Mr. Pennell's "Pen Drawing and Pen Draughtsmen."

"Carbolineum Avenarius."

SHERBORNE.—J. E. B. writes: "Can you give me the address of the makers of 'Carbolineum Avenarius,' a preservative solution for timber?"

Peters, Bartsch and Co., Derby, and 68 Queen Street, Cheapside, E.C.

Clayton Hospital, Wakefield, is to have a new Nurses' Home. Messrs. Simpson and Richardson, of Wakefield, are the architects.

Masters and Men.

The Taunton Bricklayers and Carpenters' Strike has now been in progress since April 1st.

The Ipswich Bricklayers have struck for an advance of $\frac{1}{2}$ d. per hour. About 160 men are out.

The Colchester Building Trade Dispute has been settled, an agreement having been come to under which the men will apply for no further advance for the space of three years. Some few weeks back a manifesto was issued by the employers in which they offered certain terms provided the men would agree not to make further applications for advances in the rate of wages till April 1904. To this the men replied with a counter-manifesto, demanding certain advances and the adoption of a new code of rules. The men have now accepted the three years' armistice, but have failed to get the new rules adopted. On the other hand the masters have conceded an extra $\frac{1}{2}$ d. rise per hour for the carpenters—in response to an application for 1d.—to take effect from August 1, and the bricklayers' advance of $\frac{1}{2}$ d. granted in April last stands as it was.

Lock-out Clause for Cardiff Corporation Contracts.—Some time ago the Master Builders' Association of Cardiff suggested to the Corporation that, in addition to the strike clause, a lock-out clause should also be inserted for their protection. This proposal is vigorously opposed by the workmen's unions, who, however, entirely agree to the provision of a strike clause, and also an arbitration clause. Last week a deputation from the men waited on the Corporation and gave their reasons against the proposed lock-out clause. These were, briefly, that nothing had happened to justify the insertion of such a clause. They had worked amicably with the employers. They had a code of rules for working which prevented any strike occurring, and those rules included a conciliation rule. They first considered any dispute from a conciliatory point of view, and, failing to settle on that basis, they went further and referred matters to arbitration, and in the event of arbitration also failing they would finally appoint an umpire, whose decision was final and binding upon both parties. They understood the clause was not to be limited to their own area of the dispute, but was to have unlimited area; that it was not to be confined to the members actually interested, and that it would be prejudicial to the interests of those affected and partial and unjust in operation. Mr. Barr (representing 150 operative bricklayers) said that twelve months ago 2,000 men in his trade were locked out through the action of eighteen. They endeavoured to work in harmony with the employers, and, instead of getting six months' notice as they were entitled to, they were simply locked out at a day's notice. They felt it to be an injustice that men acting honourably with the employers should be victimised and their wives and families made to suffer through the action of a few individuals over whom they had no control. The master builders, when they enforced the lock-out, said they regretted to have to do it, but they were bound by the action of their executive.—A similar clause was rejected last week by the Cardiff Union Guardians.

Architectural Association of Ireland.

—The fourth annual excursion of this association took place on July 13th and 14th to Kilkenny and neighbourhood. About twenty members were present. Of all the places of interest visited perhaps Terpoint Abbey, near Thomastown, was the most interesting—a fine example of the Hiberno-Romanesque period. It is now unfortunately in ruins. The afternoon was spent in Kilkenny, where the Castle and its fine picture gallery were thrown open for inspection. St. Conice's Cathedral, St. Francis Abbey, and the Black Abbey—all mediæval work—were visited, and also the Roman Catholic Cathedral, a building of the "Revival" period.

THE BUILDING TRADES' GIFT TO THE NATION: ITS CONCEPTION, MANAGEMENT AND EXECUTION.

THE Building Trades' Gift to the Nation, which is practically the only tangible monument of that great wave of charity which has passed over the country during the Transvaal War, and to which our readers have so generously contributed through our Fund, will take the form of six fine homes for disabled soldiers, to be erected at Bisley and equipped with all the necessary offices, such as service block, &c., and a fine central building containing a recreation hall common to the whole of the inmates.

We have referred from time to time to this Building Trades' Gift, announcing the various donations in kind and in money, and it is needless to say that it has been closely associated with the trades in question. We were very glad to be able to announce a few weeks ago that actual building operations had been commenced on the land so generously presented by Lord Pirbright, which is now the scene of activity under the direction of one of our leading firms of builders—namely, Messrs. George Trollope and Sons, whose senior partner, Colonel George Trollope, is taking such a great personal interest in the matter.

The Origin.

It was at one of the fortnightly luncheons of the Executive of the British Fire Prevention Committee that the scheme was mooted by Mr. Edwin O. Sachs, and within a few hours a small committee had been formed to take up the matter, comprising only members of that Committee. Besides Mr. Edwin O. Sachs, who has acted as chairman throughout, there were Messrs. Hammond, Farrow and Marsland of the Executive of the B.F.P.C., Sir John Taylor, Mr. Arthur Cates and Mr. Thomas Blashill of the Council of the B.F.P.C.; and the first builder members were Mr. Howard J. Colls and Mr. Randall, who represent the building trades on that same Fire Committee. A few days afterwards a committee of stewards was formed, representing the large builders, the builders' merchants and the builders' manufacturers of Great Britain, these stewards also including a representative of the electrical trade and a representative of the furnishing trade; the names are as follows:—Messrs. W. Sapcote (President of the National Association of Master Builders); Thomas Gregory (President of the London Master Builders' Association); H. H. Bartlett (Perry and Co.); Robert Boyle (R. Boyle and Son); J. Mowlem Burt (John Mowlem and Co.); Max Byng (General Electric Company); F. J. Dove (Dove Brothers); H. Holloway (Holloway Brothers); Robert Neill (R. Neill and Son); F. May (Holland and Hannan); George H. Trollope (George Trollope and Sons); G. E. Wragge (Eastwood and Co.); Stanley G. Bird, and Sam Waring.

Finally, the scheme had the benefit of the secretarial offices of Mr. Thomas Rider, of Messrs. T. Rider and Son, past president of the Association of Master Builders, and it would be well to record that Mr. Sachs wishes it to be known how much he has been indebted to the able assistance of Mr. Rider in the successful issue of his scheme.

Gifts in kind were first asked for, and many of these immediately came to hand, from the 750,000 bricks of Messrs. Eastwood and Co. to such small gifts as a few bell-pushes and a gross of nails. The contributions came in from all parts, as much from the North of England as from the Home Counties, and after a time,

when the value of these gifts in kind had exceeded £15,000, there came a question of collecting the money for putting the materials together, whilst many firms also put their hands in their pockets and gave hard cash. It was then that Mr. Sachs was able to solicit the help of the working men of Great Britain, who in large numbers contributed their sixpences and shillings until now there is a very large total. One firm alone sent £80, subscribed by more than 2,000 men; but there are also cases of small masters employing twenty or thirty men who have made their little collection to help in this work. It is in the money direction, too, that assistance is now still specially required to fully complete the scheme. We understand that nearly £5,000 in cash is still required, and it is to be hoped, now that everything is in working order and a start has been actually made on the buildings this remaining sum will shortly be forthcoming. In hard figures, more than £20,000 have been collected in kind and cash, whilst £5,000 in cash, and £2,000 in kind are still required to complete the Homes. As to

The Buildings Themselves

(perspective and plans of which we are able to give this week through the courtesy of Mr. Sachs) the following points may be of interest: They have been designed by Mr. Sachs, in consultation with the other members of the executive, and the principle observed is that no Home shall hold more than sixteen inmates, whilst each pair of Homes shall be served from a mutual service block which, besides containing the kitchens, &c., will also afford accommodation for the matrons, nurses, servants, &c. The unit of habitation is therefore sixteen, and the unit of service thirty-two. Each unit of sixteen has its own living-room, dining-room, locker room and a number of bedrooms, its own large verandahs, bathrooms, &c. The two units are connected to the mutual service blocks by corridors, and everything has been planned in conformity with the latest hygienic principles, whilst being thoroughly comfortable.

The general recreation house contains a large hall, workshops, and the commandant's residence.

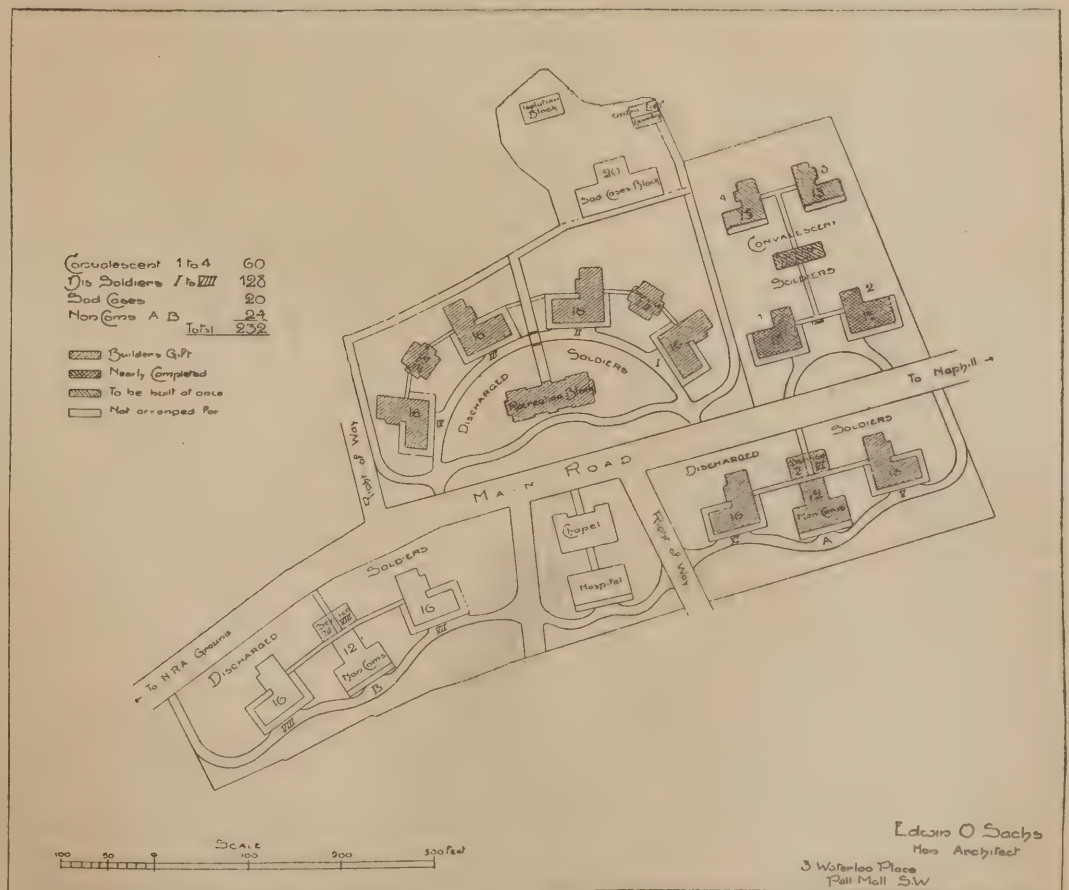

There is also a small church, a laundry, and an electric-light station, for which collections have been made in the electrical trade only.

The drainage system is now being laid down, the buildings fenced in, and the gifts even go to the extent of providing granite slabs and asphalt paths in the grounds.

As regards the date of completion, it is hoped that the Homes will be open at the end of the year, if not earlier. The furnishing, so kindly arranged for by Mr. Sam Waring (who has himself presented furniture for one entire Home), will be taken in hand, and the only point that will then remain will be to lay out the gardens for the coming Spring, and thus to complete what will be the only monument in Great Britain in which one great trade has combined—masters and men—for the welfare of fellow men who have been injured whilst fighting their country's battles.

It is of course only to be expected that an enterprise of this description should require an enormous amount of organisation and clerical work. Regarding the clerical work, this was undertaken at the offices of the British Fire Prevention Committee, whose staff are accustomed to the rapid methods with which Mr. Sachs is so generally associated. Besides the assistant-secretary of the Committee, Mr. Taylor, a very considerable amount of time had to be devoted to the work by a staff of typists and boys, and when one has to deal with many small subscriptions in money, besides a very complicated correspondence relating to the gifts in kind, it is not surprising that a good deal of "standardising" was applied as far as letter-writing was concerned. After the buildings had been designed and the quantities taken out, lists of the requirements in kind were printed, specifying the amount of material for each Home and service block, and the various donors were invited to state exactly what they would give.

As was only to be expected, certain branches of the trades were exceedingly liberal in their offers, whilst others were absolutely the reverse. Thus, for instance, whilst the tiling, asphalt and wood-block flooring trades would have provided twenty times the amount of the material required, and chimney-pieces, brasswork, locks and doors could be had in any quantity, the timber trade has, up to the present, not supplied £50 worth of timber, nor has any timber merchant contributed any substantial sum of money; and this is a very curious fact, seeing how much the timber trade

PLAN OF SITE NEAR BISLEY.

HOMES 1 AND 2, WITH SERVICE BLOCK.

is associated with building generally. Of course the cement, lime and brick trades, as already publicly known, have given an enormous amount of assistance.

When the dearth of timber became so unpleasantly noticeable, a remodelling of the design to fit the materials had to be considered—wooden roof-trusses had to be altered to iron ones, and other details had to be changed.

Then the workmen had to be approached, and a very large number of posters and collection sheets had to be sent out all over the kingdom, the collections generally being made through the kind offices of the various builders, who again had the assistance of their foremen; and in many parts of the country there was a friendly rivalry among the firms as to who could get the best averages in comparison to the men employed. Frequently whole counties or large townships co-operated, and where there was co-operation there was generally a very good result.

The next step was in respect to dealing with towns where collection was not deemed advisable. Here concerts were organised, processions arranged, and the latest in this direction has been the sports at Walsall. Birmingham, Leicester, Nottingham and other Midland townships have been well to the fore in this special direction. Every letter regarding these matters was dealt with personally either by Mr. Sachs or by Mr. Rider, the answers being at least dictated by them personally, so that they were able to keep well in touch with all the donors and to bring their influence to bear upon their different friends.

The Actual Building Work.

When the question of getting the gifts in kind and the monetary contributions together was in full swing the question of execution had then to be dealt with, and it need hardly be mentioned that it was here that the splendid committee of stewards came in particularly useful. With nearly all of the leaders of the building trade round the table, a great number of questions could be settled in a few minutes, and perhaps one of the most momentous questions was when the selection of the builder who was to do the work came up for consideration. Colonel Trollope, whose interest in military work is so well known, was unanimously desired to help in this direction, and it was one of the most fortunate features of the scheme that he so kindly personally undertook to look after this matter:

The site being situated some distance from Brookwood Station, it was found necessary to run a special siding right on to it from the nearest railway points, which were Bisley Camp Station of the National Rifle Association and Brookwood Station, and it need hardly be said that, with the good facilities offered by Colonel Crosse and the War Office, this line was very soon put into working order, Mr. Symons, A.M.I.C.E., looking after the railway work.

Collecting the Gifts.

Then came the collection of the gifts. It is generally considered to be by no means an easy matter for a builder to get his goods together when he is ordering them from his merchants near at hand as a matter of business; it may therefore be imagined how complicated the matter becomes when in any one house materials are being presented by all kinds of firms of all possible trades from Edinburgh to Falmouth, and everything has to be brought up to time and got into the right place without undue expense.

The system adopted was one of issuing "authorities." The donor was authorised to deliver his materials, and where necessary tracings were attached to his authority. Messrs. Trollope were authorised to accept the goods, and then there was the revision stage on behalf of the Executive, whose member, Mr. Ellis Marsland, examined the presents before the receipts were issued. This again involved quite an organisation of "notices," and numerous forms were used for this purpose. Then of course came the question of addressing, and the goods were not only addressed, and labels supplied for this purpose, but each article received a label showing into which building it was to go—whether into Home No. 1 or 2, whether into the Recreation House, whether for the Church, or for the buildings generally. These various labels, besides bearing the number of the Home for which they were designated, showed different colours, so that every labourer could immediately see how to distribute his goods when unloading the trucks, &c.

It has been quite interesting to see the unloading operations at Brookwood and Bisley Stations, especially when there have been as many as twenty or thirty trucks at a time. There are a number of trolleys and a small locomotive running up and down the siding distributing the goods into their proper places.

Every "authority," "notice" or similar form, by the bye, is personally examined and signed by Mr. Sachs, who, together with Mr. Rider, jointly issue the various receipts. Mr. Marsland, as already stated, attends to the delivery, Mr. Hammond looks after the sanitary matters, and Mr. Farrow attends to the questions of ventilation and warming.

Everything being departmentalised and decentralised, although working from one headquarters, runs very smoothly, and during the whole of the operations there has scarcely been a hitch.

Taken altogether, there are many novel as well as interesting features in the organisation, management and execution of the Homes presented by the Building Trades of Great Britain, and quite irrespective of anything else it speaks well for the Executive of the British Fire Prevention Committee, as a small scientific society that manages to get through an enormous amount of work in a very short time, that a big scheme of this description—valued in all at £30,000—can be organised and managed with so little trouble and in such a popular manner solely from its own membership, and that the building trades generally have welcomed the assistance they have had from this young society, and have appreciated the manner in which this young body has been

able to bring so many conflicting elements together for a mutual effort in this patriotic scheme.

A.A. SUMMER VISITS.

OLD PLACE, LINDFIELD.

OLD PLACE, Lindfield, the residence and park belonging to the celebrated designer and artist in painted glass, Mr. C. Eamer Kempe, was visited by the Architectural Association on Saturday last, the third Summer visit of the session. The approach to the mansion is very picturesque; a large quantity of ancient domestic work exists in many directions to interest the visitor, until the grand old parish church is reached. This is a most interesting structure in various styles, with a characteristic Sussex tower and lofty spire, the building possessing a perfect store of fine mediæval design, while at the same time much of it has been done up in such a judicious manner (it cannot be called in the usual sense "restoration") that it is at once a most interesting place to the architect or the antiquary; whilst its pictorial qualities would appeal also to any artist—its grouping of parvises porch, deep transepts, large chancel and other features, culminating in the elegant entasis of the spire niches, the whole a centre of singular picturesque beauty. In the churchyard are some very admirable last-century tombs. Leaving the public footpath that passes through this place, and entering the road beyond, is seen a cluster of large ancient domestic buildings, the chief one being the west front of the mansion of Mr. Kempe.

Passing this to enter the building, one goes through a large pair of very elegant wrought-iron gates, when the visitor is at once confronted with the north side or entrance front of the mansion. This is an exceedingly picturesque three-storeyed erection, with many timber gables of varying sizes, and stone-covered roof, with mullioned windows filled with leaded lights, containing small portions of fine painted glass. The walling of the two upper storeys is covered with plaster, or fine rough-cast, upon which a pattern of large intersecting circles has been incised, the whole being tinted a soft yellow colour. The barge-boards to the gables (one or two of the gables being ancient) are of oak, weathered to a silvery grey tint.

The western elevation, a continuation of the one mentioned, is an entirely ancient structure of brick, stone, and much half-timber work, and is an eminently picturesque specimen of the work of the Elizabethan period. This portion of the house was erected as a residence by the ancient Sussex family of Challoner, in the time of Eliza-

beth, upon the site of a much older edifice, one that was then known by its present name of "Old Place"; it was purchased by its present owner about twenty-five years ago. The south or garden front continues this ancient elevation for a little distance, when the very large additions by Mr. Kempe are reached. These are carried out in the spirit of the old house in a most consummate manner, the difference between the old and the new work being so slight and the workmanship being all so admirable that one may be pardoned for not noticing it at first sight. In addition to this Mr. Kempe has, in making these extensions, devised in the most masterly manner the features of the fronts, so that the ideal of a first-class Sussex manor house of the sixteenth century is never obscured; the result is that the whole place is certainly one of the most beautiful mansions the Architectural Association have inspected. These additions were erected in 1884 and 1891.

Entering the porch in the old west front we are in what is termed the old kitchen hall, lined with Elizabethan panelling, with a ceiling of black oak joists filled in with plaster, and a fine Elizabethan fireplace. The next room to this is also most interesting, with small circular ornamental plaster panels in the ceiling, and another fine fireplace with secret cupboards built into it; upon the four-centred arch of the mantle are the arms of the Challoners. In the next room—the library, entirely filled up by Mr. Kempe—are some delightfully treated shelves and book lockers all in light oak with finely designed black iron hinges; a metal screen serving the same purpose, divided into squares and pierced, coloured alternately a rich blue and deep gold, was much admired; the ancient panelling terminated with a row of small circular pilasters forming a frieze was most interesting. A cabinet here made of carved panels of the time of Henry VIII. is an important feature in the furniture of the room. Passing through the entrance hall we come to the entirely new portion of the house, and enter what is termed the great parlour, an apartment about 35ft. long by 24ft. broad. The great feature here is the magnificent treatment of the ceiling in plaster and, apparently, wood. The whole is most richly divided by moulded ribs into panels radiating from centres, at each of which is placed a hanging pendant, forming, as the ribs curve down upon it, the well-known Elizabethan type of ceiling that seems founded upon the principle of fan vaulting. These pendants are terminated with a very graceful construction of small volutes and a flower. The fireplace is of great size, inlaid with wood and ivory, and was formed upon the model of one in the castle at Helmsley; it is full of very rich refined details. The bay windows have extremely fine paintings on glass by Mr. Kempe placed in the upper portions of them.

The furniture here, consisting of old oak and some fine mahogany articles, the grand tapestry and antique carpets, and the many little things of refinement, made a sumptuous apartment. Leaving this chamber, the drawing-room was inspected: this is carried out in the most artistic style. The halls are lined with new oak carved and moulded, with picture panels, and above is an Elizabethan floral frieze divided into compartments by a delicate arcade, each portion containing a vase with conventional flowers. The ceiling is similar in design to that of the great parlour. The windows are filled with exquisite stained glass in floral patterns with poetic mottoes, the whole of which are chiefly in delicate brown stain, rich yellow, and white glass. The general effect of this room is most refined though gorgeous, and the appearance is enhanced by the good taste in furniture and appointments. In general this room, like everything in the whole house, has that which is required to make it a complete whole. In no apartment, equally with the design of the house or its gardens, is there anything that may be termed superfluous, and the result generally is a most pleasing richness combined with artistic simplicity. The dining-room, like many of the other apartments, has, as its chief feature, an exceedingly fine ceiling based upon the principles of those of the time of

Anne or the early Georges. It is divided into large coffer, or panels, by massive intersecting beams richly ornamented and delicately moulded.

The room contains as usual a large fireplace modelled on those in the old portion of the house with a very fine dignified effect; the walls are hung with beautiful tapestry from the designs of the owner; the whole room is most pleasing and interesting. The principal staircase was inspected next; it is in new oak of a very light, if not raw colour, like so much of the oak about the house, and is very novel and picturesque in treatment. An upper long gallery was reached and the bedrooms were inspected. Their number is very considerable, and their artistic variety seemed inexhaustible; one room with a beautiful flowing design in plaster on its ceiling, a charming coloured frieze, and its walls hung with loose old dark green silk brocade, was much admired; the furniture was exceedingly costly, not only here but throughout the house. Many more beautiful bedrooms were seen, and much fine furniture, china, books, together with splendid specimens of Mr. Kempe's painted glass in various rooms, and in the chapel—a most interesting chamber, one that possesses a large and beautiful screen rejected from the parish church at its restoration. We proceeded to inspect the gardens laid out in the "formal" manner. This has been so done that they really formed a great part of the pleasure of the visit; the trees and shrubs are so charmingly disposed in conjunction with large plain surfaces of vivid green grass that the resultant effect is excellent. In the centre is a lofty sundial upon a brightly painted and banded shaft. So, with every expression of thanks to Mr. C. Eamer Kempe, the party returned to London, having inspected an almost ideal English country house.

H. D. W.

Views and Reviews.

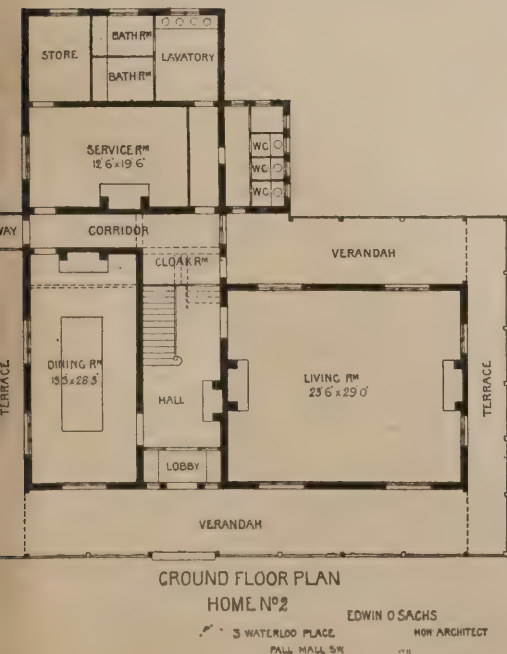

KENSINGTON PALACE.

The interest taken by the public in Kensington Palace is largely due to the fact that it is so closely associated with the early life of the Queen. As is well known, it was at Kensington Palace that Her Majesty was born, and here she lived up to the time of her accession. The Palace has, however, strong claims upon our attention by reason of its architectural interest. The orangery is one of Wren's most beautiful buildings, and the Palace itself, though by no means wholly satisfactory, contains much that merits the attention of the architectural student. Mr. W. J. Loftie's little book, a second edition of which has just been published, gives as much attention to these matters as can reasonably be expected in what is primarily a popular guide to the Palace and gardens. We think, however, it would have been well—even in a book intended for non-technical readers—to point out in what respect Kent's gorgeous decorations offend against the canons of artistic taste. To say that this "may be criticised" and that "must be censured" does not convey much information. A little more definite criticism in handbooks of this kind might do something to raise the standard of popular taste. Mr. Loftie writes agreeably, and evidently with knowledge. This new edition has been revised and enlarged, one of the most interesting additions being a plan of the gardens made in 1762. There are also several new illustrations from photographs.

"Kensington Palace and Gardens" (revised and enlarged edition), by W. J. Loftie, B.A., F.S.A. Farmer and Sons, Kensington High Street, London, W.

New Police Station at Swansea.—

A sub-committee of the Swansea Corporation recently considered plans of a new central police and fire-brigade station. The plans set forth two schemes, the cost of one scheme being £20,000 and of the other £15,000. The site of the proposed new station is at the rear of the Free Library, Alexandra Road. The matter was deferred.

Professional Practice.

Croydon.—The new Victoria Wing of the Croydon Hospital, opened recently by Princess Christian, is on the south-western side of the hospital. It contains on the ground floor an entrance hall with porch, committee-room, a ward for fourteen men, with ward kitchen, clothes-room, linen-room, bathroom, and lavatory, and a sanitary spur containing conveniences, slop sink, closets, and scrubbers' scullery; on the first floor the matron's bedroom and bathroom, a ward for fifteen children with adjuncts, and a ward for four women with sanitary spurs; on the second floor nurses' dining-room, sixteen bedrooms for nurses, bathroom, lavatories, linen-room, box-room, and a sewing-room; on the third floor, bedrooms for five servants and a box-room. There is also ample cellar accommodation in the basement. The staircase has been rebuilt, and a lift to all floors provided. In addition, in the Royal Alfred Wing, that portion of the ground floor which was at the level of the old original building has been lowered, so that the whole ground floor is now at one level. The old casualty-receiving and operating room has been given up as a waiting-room, and two small rooms, originally intended for night porter, have been thrown into one and fitted as the casualty-receiving room. The work has been carried out by Mr. E. J. Saunders, builder, of Croydon, from the designs of Mr. Charles Henman, architect, his clerk of works being Mr. E. Crane. Messrs. Wenham and Waters, of Croydon, installed the hot-water apparatus and electric lighting, and Messrs. Clark, Bunnett and Co., of New Cross, supplied and fitted the lift.

Sheffield.—The pavilion at Bramall Lane Cricket Ground is to be altered according to the designs of Mr. A. E. Turnell, architect. There will be a complete rearrangement, and the measurement of the new structure will be 170ft. by 50ft. In the basement at the Bramall Lane wing will be billiard and reading rooms for the players, together with public and players' lavatories. In the bowling-green wing, also in the basement, are to be the members' lavatories and other offices. On the ground floor at the Bramall Lane end the amateurs' dressing-rooms will be built, with smoking and reading rooms adjoining, and a private luncheon-room behind, together with an elaborate arrangement of baths. The size of this dressing-room will be 31ft. by 18ft., with a window overlooking the play 16ft. wide, thus affording the occupants a view of the game which in the present building has been virtually impossible. In the centre, on the ground floor, will be the members' public room, 63ft. long, the whole frontage being of glass and iron. At the back will be the pavilion bar, together with the public bar, this latter having a separate entrance from the rear of the whole building. At the bowling-green end is the secretary's office, cloak-room, and a series of large committee-rooms, with separate entrance to the bowling green, which it is proposed to still maintain. A verandah runs the full length of the building, with a raised platform at each end, the pavilion itself being raised three steps above the level of the verandah. On the first floor in the Bramall Lane wing are the professionals' dressing-rooms, with a similar series of baths to those below; next to this will be a much-needed writing-room for reporters, whose gallery will be in the balcony immediately in front, and very much in the same position as the present one. This gallery is 20ft. by 11ft., and should give good accommodation, whilst the room itself is 20ft. by 15ft., with the telegraphists' room immediately behind. Out of the reporters' room is a separate entrance to the general balcony, which runs virtually the whole length of the building. The public dining-room is also on this floor, 63ft. by 36ft., with a separate staircase; whilst at the bowling-green end are the committee's luncheon-rooms, ladies' tea-rooms, and other offices.

Change of Address.—Mr. T. Potter has removed from 95 Brigstock Road to 5 Outram Road, Croydon.

New Patents.

These patents are open to opposition until August 20th.

1899.—Ratchet Braces.—5,338. J. BLAKEMAN, 71 Stephenson Street, South Shields. The feature of this brace is that it can be used in a right or left handed direction. This is made possible by centering the hand lever in such a manner that it may be turned to bring one or other of its sets of teeth into engagement with the main toothed wheel.

Fixing Rainwater Piping.—12,081. A. B. GEE, 4 The View, Morland Avenue, Croydon. Ordinary rainwater pipes have a socket formed on the pipe itself, so that pieces may need to be broken off to make the piping fit. This invention provides a detachable socket which enables such broken lengths to be used, besides facilitating ordinary connections.

Mixing and Transporting Concrete.—12,400. J. H. FISHER, 639 G. Street, N.E., Washington, U.S.A. This invention is designed chiefly for street work, and its object is to mechanically mix the concrete while it is being taken to the place where it is wanted. The apparatus is mounted on wheels like a cart (with shafts) and consists of a drum made in two halves in which the materials are placed. By an arrangement of pawls and ratchets the drum only turns when the apparatus is drawn in one direction, remaining stationary when drawn in the other. The concrete is discharged down a chute.

Tile-making Machines.—12,453. E. HODGKINSON, Clifton House, Heathcote Street, Chesterton, Stoke-on-Trent. To the periphery of the clot rolls segments of suitable section are attached, and so roll out a continuous length of clay marked or shaped as required. Lengths are mechanically cut off by a knife operated by a lever which is moved periodically by pins on a roller.

Indicators for Cranes.—14,024. R. W. MONAHAN, 375 Chester Road, Manchester, and H. BARSDOFF, of the same address. A strong spring is introduced into the length of the derrick rods or chains, and when the crane is set to raise a load which exceeds the strength of the spring the latter is compressed and moves the hammer of a bell, opens a steam whistle, or shuts off the steam to the engine; thus avoiding accidents from over-loading.

Watering-carts.—14,573. E. S. SMITH, 35 Botanic Road, Wavertree Park, Liverpool. This invention relates to motor watering-carts. The initial pressure on the water is kept up by discharging the exhaust of the engine into the water tank.

Cooling Buildings.—15,964. F. R. COADY and J. J. COADY, both of 12 West Sixtieth Street, New York. The ceilings are made of metal or other waterproof material and slant upwards to the centre. During hot weather water is run over the top of them and collected in pipes that pass through the walls and communicate with outside pipes.

Fireproof Slabs.—W. P. THOMPSON, 322 High Holborn, W.C. (*Simmons and Bocks, Munich*). The foundation of the slab consists of asbestos treated in a rag engine and cement. Other materials are added and the mixture is pressed into moulds, a core of wire netting or other material being inserted if desired. The slabs are then dried and further impregnated with water-glass, sulphate of alumina, or similar substances.

1900.—Construction of Walls for Quays, Platforms, &c.—8,814. F. HENNEBIQUE, 54 Boulevard St. Michel, Paris. This is a system of construction of strengthened cement beton which is made into blocks and then transported to the site, where they are put in place by simple juxtaposition. Each block consists of a sole or base plate, a face and one or more buttresses. Iron rods are used in the erection for strengthening the construction.

The following specifications were published on Saturday last, and are open to opposition until August 27th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—10,386, DUCAT, aerobic bacterial filters for the purification of sewage. 12,883, DUMONT, apparatus for repairing incandescent electric lamps. 13,011, BOND, acetylene gas lamps. 13,060, ELLIS, construction of bricks and other moulded building materials. 13,163, NOAD AND BAKE, glazing or enamelling compounds for pottery. 13,423, WILLIAMS, BAGSHAW AND PENDLEBURY, treatment of wood. 13,470, BULLIVANT, BULLIVANT, BULLIVANT AND BULLIVANT, sawing-machines. 13,471, BULLIVANT, BULLIVANT, BULLIVANT AND BULLIVANT, sawing-machines. 13,472, BULLIVANT, BULLIVANT, BULLIVANT AND BULLIVANT, pulley stiles of sash window frames. 13,509, ALDRIDGE, electric cranes. 13,575, JANSEN, wardrobe hook. 14,282, MILLINGTON, heating and ventilating apparatus. 14,639, JOHNSON (*Kalle and Co.*), colouring-matters. 15,094, TUCKER AND DAWS, locking and unlocking of drawing compasses. 15,690, WILLIS AND BATES, tops or caps for soil or rainwater pipes. 15,765, WHITTAKER, bacterial treatment of sewage. 16,135, READ-HOLLIDAY AND SONS, LTD., TURNER, DEAN AND TURNER, manufacture of colouring-matters. 16,235, PARTL, acetylene gas generator and apparatus. 16,399, SALSBURY, acetylene lamps. 16,405, WILSON, water heater for domestic supply and hot-water heating purposes. 16,410, ECKSTEIN AND ANGOLD, electric arc lamps. 16,425, RICHES, sand-mould pressing machine. 16,469, TAYLOR, method of constructing brackets, stiffeners, gusset stays and beam pockets, used in girder work, steam generators, and other structures and erections. 16,794, TWEEDIE, anti-vibrating arrangement for incandescent gas lighting. 16,894, LAKE (*Fährdrich*), suspension gas lamps, chandeliers, &c. 17,119, FREEMAN AND PERRY, dust-collecting apparatus. 17,814, SPITTAL, bandstands or similar erections. 19,036, BJÖRNÖD, acetylene gas generating and storing apparatus. 20,056, LEVICK, manufacture of a certain part of ball floats. 23,204, HENAY, moulds for forming relief ornamentation on the walls and ceilings of rooms, book covers, &c. 23,623, MEYER, taps or cocks. 23,990, LÜHNE, manufacture of glass and other analogous substances.

1900.—839, LAKE (*Sugarman*), incandescent electric lamps. 1,292, JENSEN (*Margonari*), gas lamps for lighting and heating. 7,102, CROWE, grate bars. 7,204, CROWE, grate bars or frames. 7,539, MORIN, apparatus for generating acetylene gas. 7,611, MORO, incandescent vapour lamps. 8,633, KISTNER, roofing-tile made of artificial cement. 8,791, WHITMORE, roofs and roofing. 8,792, PFAHL AND MAYNARD, columns. 8,888, JACOLIN, instrument for drawing and measuring angles. 8,966, MURPHY, art of manufacturing tubes or pipes. 9,093, ADAMS, tip-up lavatory basins. 9,120, PELTON AND MOSHER, building constructions. 9,131, KIELBERG, manufacture of pipes from cement.

The Organ in St. George's Chapel, Windsor Castle, is being thoroughly cleaned and repaired, and some of the stops are being altered, while new ones are being added. St. George's Chapel is now lighted by electricity, both in the choir and in the nave, and the Queen has caused the Royal vault underneath the Albert Memorial (Wolsey) Chapel to be similarly lighted. An altar has been placed at the upper end of that sepulchre.

National Memorial to the Duke of Westminster.—It has been decided that, as a national memorial to the late Duke of Westminster, the rose window in the south transept of Westminster Abbey and the twelve lights below it shall be filled with stained glass of a more satisfactory character and more harmonious colouring than that which is now there. The work, which is estimated to cost not less than £3,000, will be under the general direction of Mr. Bodley, A.R.A.

Correspondence.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It is about time, I think, that architects' assistants should unite and advocate for increased salaries: the paltry sums paid by architects to their assistants demand this. Take, for instance, the average young fellow who, after paying from 80 to 200 guineas for three, four, or five years' pupillage, when out of his articles has to accept a situation as junior at the splendid wage of 15s. to 25s. a week!—and on this he is supposed to dress well and keep up an appearance, which cannot be done without help from his parents. As he gets older, his chances do not greatly improve. If, at the age of thirty, he gets £2 a week he probably considers himself fortunate; yet most mechanics would scorn this pittance. I know several clever draughtsmen, well educated, with nine or ten years' experience, who are getting salaries under this sum.

Just look at the advertisement pages of the building papers week by week and note the consummate impudence of those advertising for assistance. Very often the assistant who gets a salary hardly sufficient to keep himself knows quite as much as, if not more (and may have better qualifications) than, his employer. The following are quite usual types of advertisement—they speak for themselves:—

ARCHITECT'S Assistant wanted at once.
Good draughtsman, able to prepare detail drawings and plans from rough sketches. Salary £1.

A man with six years' experience would hardly be able to do more than the advertiser requires.

ARCHITECTURAL Draughtsman required
in London. Only thoroughly qualified men of experience need apply. Designing, construction, details, surveying, perspective, and quantities. Salary 2 to 2½ guineas.

This needs no comment. Surely in no other profession requiring so many years' study and such all-round knowledge and education is the remuneration of the assistants so utterly inadequate.

Another grievance is the number of hours the architect's assistant has to work. The average office hours are from 9.30 A.M. to 6 P.M., and for any time he may work beyond this he usually receives—nil. One member of the profession with whom I am acquainted does not pay for overtime, but presents his assistants with sixpence for their tea! Such munificence is overwhelming!

I am sure you would be conferring a great boon upon architects' assistants in general if you could spare the space in your valuable paper for the discussion of this timely subject. I enclose my card, and remain at present,

DISGUSTED.

[This subject is one of wide interest and we shall be glad to hear what other readers have to say.—ED.]

Strength of Beam.

To the Editor of THE BUILDERS' JOURNAL.

Bromley, Kent.

SIR,—On page 411 of your issue of July 4th Mr. Henry Adams gives the safe load on a fir beam 12in. by 9in. and 13ft. long as 234 cwts, factor of 8. The querist I think stated that there is a storey post under its centre as well as both ends being fixed. The above result seems far short of what the beam would carry according to other formulæ, unless I have misunderstood Mr. Adams's result. Will he kindly tell me if the following are of any use? I have calculated a similar beam but only supported at ends and with no storey post, factor of 8 in each case:—

Molesworth.—B.W. in cwts. distributed load
 $= 8 K B D^2$
 L = safe load over 13ft. = say, 5 tons.

$K = 12$. B and D all in inches.

Hurst.—B.W. in cwts. distributed load
 $= 2 \times C \frac{b d^2}{L} = 4.35$ tons, safe load over 13ft.

$C = 3.6$ (fir). b and d in inches. L in feet.

Storey on Strains.—B.W. in cwts. distributed load

$$= 8 \frac{a d S}{l} = 3\frac{1}{2} \text{ tons, safe load over 13ft.}$$

$$\left. \begin{array}{l} a = \text{area} \\ d = \text{depth} \\ l = \text{length} \end{array} \right\} \text{in inches. } S = 1,346.$$

Quick:

$$\frac{W l^2}{8} = \frac{S b d^2}{6} = 4.43 \text{ tons, safe load over 13ft.}$$

$S = 6,500$. b and d in inches.

This is similar to Mr. Adams's.

The average is

$$5 + 4.35 + 3.75 + 4.43 = \frac{17.53}{4} = 4\frac{1}{2} \text{ tons, say,}$$

against Mr. Adams's 234 cwts.

Yours faithfully,

J. E. J.

Surveying and Sanitary Notes.

Improvement of Reading.—It is proposed by the Corporation of Reading to rent ten acres of land from Caversham Bridge to the Scours for the purpose of public walks and pleasure grounds. The projected promenade will enhance one of the prettiest reaches of the river.

The Surveyors' Department of the Oldham Corporation being hampered for room in consequence of the increase of work devolved upon the department in late years, it has been decided to increase the accommodation in the Town Hall. Plans have been drawn and the contract has been provisionally let for the work of alteration, the lowest tender being £347 10s.

The Parish of St. Pancras.—According to a report by Mr. W. N. Blair, engineer to the St. Pancras Vestry, of the 2,672 acres which constitute the total area of this north-western borough, 688 acres are unbuilt upon, and more than one-fourth of St. Pancras is public or semi-public open spaces and railways. The open spaces include parts of Regent's Park and Primrose Hill, Parliament Hill Fields, Waterlow Park and Highgate Cemetery.

Improvements at Barry.—The Barry Urban District Council last week decided to proceed with the construction of the lower part of the Gladstone Road and the proposed small-pox hospital, the latter to cost about £9,000. Earlier in the year the Council acquired powers to build the hospital and selected a tender for that purpose, but through postponement and delay the contractor declines to go on with the work at the original price, owing to the increased price of materials. The work will now be retendered for.

Open Spaces in the City.—On July 9th a committee of the House of Lords considered the Various Powers Bill of the Corporation of the City of London. The Bill proposes to acquire powers in relation to baths and wash-houses, a crematorium, public service works, open spaces, bridges and other structures over streets, public lighting, water-closets, obstructions, finance, &c. The section to which the main opposition was directed was that which proposed the throwing open of Finsbury Gardens, in the centre of Finsbury Circus, to the use of the public. Eventually the committee found the preamble proved and allowed the Bill to proceed.

Lighting the Embankment with Electricity.—On the Thames Embankment, close to the Charing Cross railway bridge, a big building is being erected, which, when completed, will be the generating station for the electric light with which the London County Council purpose to illuminate Westminster and Waterloo Bridges and the Embankment. This will be the first attempt of the Council to provide electricity, but Londoners need not be reminded that the Embankment has previously boasted electric light.

Builders' Notes.

Bristol Church Contract.—The tender of Mr. E. Walters, contractor, Montpelier, has been accepted for the completion of St. Michael and All Angels' Church, Windmill Hill, Badminster, Bristol.

Development of Ilkley.—A number of building sites on the Myddleton Estate were recently sold. Expansion to the north or south of the town was impossible, so land was acquired on the Myddleton side of the river by the Wharfedale Estate Company, and offered for sale, as above mentioned.

Contravening the By-laws.—John Peter, joiner, was recently summoned at Kirkintilloch for allowing new houses built by him to be occupied without getting a certificate from the surveyor. The party walls had not been carried 12in. above the highest roof, and the end gable had not been so constructed as to be damp-proof, while the height of the ceiling in one of the houses was 2in. less than that fixed by the Act. A penalty of 5s. was imposed.

Working-class Dwellings for Morpeth.—Councillor Jardin's scheme for erecting working men's dwellings at Morpeth has been adopted. The sanction of the Local Government Board has been obtained for the sale of a portion of the Middle Greens, comprising about 2,200 sq. yds; a reserve price of 1s. 8d. per sq. yd. over the whole area is to be fixed. Each of the houses erected is to be suitable for occupation by a working man and his family.

He said it was due to Pique.—Mr. Frederick Lee, a builder of Alfreton, was recently charged with fixing a water-pipe to a service pipe without the surveyor's consent. Mr. Lee said the present charge against him was due to pique. Attempts had been made "to get at him," and at last the chance had arrived, although he still affirmed it was not the custom in Alfreton to give notice. If it was the law, then he did the work in ignorance. A penalty of 5s. was imposed.

The London County Council at last week's meeting entered upon a long discussion on a return of works completed by the Works Department up to March 31st last. This report stated that there had been a loss of £19,950, the estimates being exceeded by that figure. Mr. Beachcroft said the department had shown that at any rate it could not erect working-class dwellings successfully in competition with the contractor. Mr. Burns contended that the department had never had fair play from the officials of the Council. He pointed out that the work done by the Works Department was of far better quality than that done by the contractors. He hoped the time would soon come when the Works Committee would be reconstituted.—Mr. Organ said the Baroness and Mr. Burdett-Coutts had offered to the County Council the freehold of the institute in Vincent Square, and a site adjoining. The whole site comprised half an acre, and the value of it and of the buildings amounted to £11,000.

West Riding County Council Contracts.—At a meeting of this Council on July 11th Mr. J. Crowther, vice-chairman of the General Asylums Committee, reported that the Acute Hospital at Wakefield was now approaching completion. As to the proposed new asylum at Storches Hall, an estimate was prepared some years ago, amounting to £103,283, for the erection of the Acute Hospital and two cottage homes, and this was approved by the Council at the January meeting. Since then eight tenders had been obtained for the work, the lowest of which was £110,900 and the highest £125,000. The Committee now found that by the use of certain stone already on the estate and the revision of certain minor details they could effect such a reduction as would bring the cost within the estimate originally approved, so that, instead of the expenditure being £106,900, they hoped it would now be £105,900. Some time ago the tender of Messrs. Obank and Sons was accepted for the erection of laundry buildings, boiler house and chimney

at the Scalebor Park Asylum. As to the Wakefield Asylum, the Committee felt it desirable to have a thoroughly qualified practical man to look after the heating, electrical and other work there, and consequently recommended the appointment of Mr. W. M. Harrop, of Sandal, as superintendent engineer and clerk of works at a salary of £200 a year. The tender of Messrs. Isaac Gould, Ltd., of Leeds, was accepted for the erection of a bakery at Scalebor Park for the sum of £916 10s., and other tenders were accepted for improving various parts of the asylum buildings.

A Claim for Breach of Contract.—

The case of *Cook v. Axbridge Poor Law Union* recently came before Mr. Justice Lawrence at the Bristol Assize. The plaintiff (who is a builder) claimed £500 for breach of contract in connection with a tramp ward at Weston-super-Mare which he agreed to build for the defendants. The contract price was £680, and the work was to be completed by July 12th. Plaintiff's counsel contended that his client was prevented from completing the work by reason of the defendants refusing him certain payments on account, and by altering the plans and taking away his men to do work which their engineer thought ought to be done. Plaintiff had been paid a certain amount, and he claimed the balance to bring it up to the contract price, because, he said, if he had been allowed to go on with the work he would have finished it and earned his money. In addition he claimed £232 for extras which, he stated, were ordered by the defendants' engineer, and a small sum for the detention of his plant. The answer of the defendants was that the plaintiff was not ready and willing to do the work, and that as he made default they were entitled by the terms of the contract to take it out of his hands and finish it themselves. The Guardians counter-claimed for the amount which it had cost them to finish the work. It was provided in the specification that the plaintiff, if he desired, should be entitled to draw to the extent of 80 per cent. at the discretion of the engineer, but the contract did not contain any such clause. Plaintiff did actually have "draws," and about a month before the contract should have been completed he wanted more money, but could not get it. That was the only reason why he could not proceed. A consultation took place between counsel, and Mr. Duke (defendants' counsel) offered to take judgment on the claim without costs, and to abandon the counter-claim, this to settle all matters between the parties. These terms were accepted. Mr. Duke remarked that the building had cost the Guardians about £1,000, instead of £600.

Congress of Archaeological Societies.

AT the congress of the 39 archaeological societies in union with the Society of Antiquaries held under the presidency of Sir John Evans, K.C.B., on July 12th, the following resolutions were adopted:—

1. "That, in view of the discussion on the British Museum Bill lately before the House of Commons, this congress desires to press on the Government the immediate necessity of adding to the buildings at the British Museum."

2. "That this congress protests against the Bill now before Parliament to amend the Union of Benefices Act of 1860 by extending to the country at large the statutory powers now existing in the City of London by which the City churches are gradually being destroyed as a necessary consequence of the union of benefices."

3. "That in the opinion of this congress any attempt strictly to enforce the law of treasure trove would have an injurious effect not only on archaeological science but on all collections of antiquities, both public and private."

4. "While gladly hailing the proposal properly to house Diocesan records, this congress is of opinion that it would be advantageous to defer the passing of Lord Belper's Bill until after the departmental committee on the custody of local records has made its report."

On the proposal of Mr. J. Horace Round it was resolved to take steps to promote the systematic study of place-names on the lines so successfully adopted in France.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"The more extensive your acquaintance is with the works of those who have excelled, the more extensive will be your powers of invention, and, what may appear still more like a paradox, the more original will be your conceptions."

—SIR JOSHUA REYNOLDS.

Our Inset Sheets.

THE story of the Building Trades' Gift to the Nation will be found on another page of this issue. The figures in the relief "Charity," by Mr. George J. Frampton, A.R.A., are portraits. The panel is in a very rich marble—the frame being in several colours decorated with little white-metal boy angels blowing trumpets. The pear-trees behind the figures are symbolical of Love and Affection. The monument is now in Kirkby-Wiske church, near Thirsk, Yorkshire, and looks very beautiful, as it is in an excellent light. The statuette by Mr. F. W. Pomeroy is in bronze and ivory, and is a portrait of Mrs. Emslie Horniman. The bronze was cast by the Cireperdu method. The head and hands are carved in ivory. The inlay of mother-of-pearl in the belt is to represent the colour of a most beautiful belt executed for Mrs. Horniman in steel and enamel by Mr. Alexander Fisher.

The Late Mr. Gould.

THE death of Richard Davis Gould, architect, who for a considerable time was borough surveyor at Barnstaple, occurred at his residence in that town on Monday last week. Deceased was 83 years of age, and was a prominent architect in his day; he was responsible for much of the architectural beauty of Barnstaple, notably the excellent pannier market, the Albert Clock Tower, the Bridge Buildings and various private buildings. He also prepared the designs of several churches in North Devon. After filing the office of borough surveyor for forty-six years, Mr. Gould was laid aside by a severe attack of paralysis, which confined him to his bed for eight years. When he was taken ill the Town Council of Barnstaple, in recognition of the very valuable work he had done for the borough, granted him a life pension of £100 a year. Mr. Gould was an elder brother to Mr. Frank Carruthers Gould, the widely-known and clever cartoonist, and was one of the founders of the Exeter Diocesan Architectural Society in 1841; at the time of his death he was the sole survivor of the original members, who numbered more than two hundred. He was a capital descriptive writer and a brilliant and accurate draughtsman. His numerous papers and drawings preserved by the Society testify that he was one of the foremost Gothic men in the middle of the century. His only son—John F. Gould—also a gifted architect, predeceased him by some years. Mr. Gould was buried on July 12th.

A Favourite House of Dickens.

THE Golden Cross Hotel, Charing Cross, is to come under the hammer at the Mart this month. It was, as a coaching house, known as "The Bull and Mouth of the West," and from a hostelry with a sign-post and water-trough outside has become a hotel with sixty-five bedrooms. On May 13th, 1827, Mr. Pickwick and friends commenced their travels on the Rochester coach from the Golden Cross, and here it was that the pugnacious cabman "spurred away like clockwork" at the Pickwickians, who were rescued by Mr. Jingle. It was a favourite house of Dickens, who introduces it into "David Copperfield." David's arrival is described in Chapter 19. Mr. Peggotty also visited David there, and the meeting is described in Chapter 40. The arch was abolished in 1851, and a few years ago extensive alterations were carried out at the present building, which is a little to the east of the original Golden Cross Inn of Dickens.

Old and New: A Mixture.

MR. HENRY H. B. SANG becomes very wrathful in the columns of the "City Press."

He says: "Who is responsible for the act of vandalism perpetrated at the Tower of London? I noticed the other day that a barrack is being run up between the Royal Armoury and the Jewel House upon the site of the old garden. It is a difficult matter to decide the style of this very new building, but, so far as I can make out, it seems to be a sort of cross-breed between Norman Shaw's Queen Anne style and the modern School Board building. I need hardly say that this modern erection does not in any way harmonise with the simplicity and grandeur of London's ancient fortress. We find within the precincts of the Tower many buildings which are not in keeping with the style of the ancient building founded by the Romans. Until lately, however, the heart of the citadel, the Armoury, remained untouched, but now it is being disfigured and hidden by the above modern barrack. If it was absolutely necessary to provide barrack accommodation within the Tower, why was the style of the ancient building not adopted instead of the inartistic light-coloured brick building now in course of completion? This is a fit case for the Society for the Preservation of Ancient Buildings to enquire into." We have not made an examination of the building, but looking at it from the river the other day, it did seem to be very fresh and out of keeping with its surroundings; but weathering will, of course, modify it a great deal.

Colston Hall, Bristol.

It will be remembered that the Colston Hall at Bristol was destroyed by fire some time ago. The rebuilding has made good progress and the new hall is now entirely roofed in, and the interior is so far finished that the main ideas of the architect and the splendid accommodation for the public and performers can be understood. There is every prospect of the building being completed by the autumn, in time for the many musical and other gatherings which may then be expected to take place. It will be a pity if the scheme for rearranging and improving the roadway and approaches to the hall is not carried out, owing to the fear of claims for compensation by frontagers. When one remembers what large sums have had to be paid to frontagers for slight concessions one cannot wonder at the hesitancy on the part of the civic authorities. Perhaps, however, sweet reasonableness may prevail, and future visitors to Colston Hall may with more comfort and ease be able to gain access to and depart from Bristol's largest public building.

Keeping the House Cool.

THE fountains at the Palace of Westminster were very busy last week. Probably few persons are aware that there are fountains within the precincts of the Houses of Parliament. They are eminently useful, and not in the least ornamental, their purpose being to keep the roof of the lobbies in the House of Commons cool. For the better achievement of this object they are filled with iced water, which falls on a flat surface in a fine spray, and the constant evaporation going on makes the atmosphere of the division lobbies almost bearable in the hottest weather. The temperature of the House itself is kept down to 60deg. by means of iced air, and this is only one of the many things done for the comfort of the Commons.

The Pavilions at Lord's.

A NEW Press stand has been erected at Lord's, and the "Times" has become very cross because it is not in the place where it wanted it to be. And with this start its readers have taken up the cry against the M.C.C. management. One correspondent says:—"It was an extraordinary thing that something like £40,000 should be spent on structures without the knowledge of the general body of the club that such buildings were contemplated. It was extraordinary that a committee of taste, composed of members on and members outside the committee, was not

appointed. It was also extraordinary that no competing designs were called for and no architectural expert appointed as an assessor to select from those designs. I do not mean that by the rules of the club it was incumbent on the committee to do all these things. But it was incumbent upon them to do what all men entrusted with the affairs of others are bound to do—namely, to take all precautions that important business involving large expenditure is done in the best possible way. They took no precautions, and the result was buildings which Mr. Furniss has stigmatised as monstrous, erected at a large outlay, to meet which it was necessary to add 200 life members at £200 each and to pass by poorer candidates whose names had been on the books for years." The pavilions at Lord's are certainly not beautiful; cricket and race pavilions are generally ugly. But that is no reason why they should be. Capable architects might effect a reform here by providing buildings which had artistic merit in addition to the requisite accommodation, which appears to be the only consideration at present.

the carver's work which emanated from Gibbons's chisel, but the very fine and vigorous heads on the keystones are assigned to him. Louis Laguerre, assistant and imitator of Verrio, was employed to decorate the twelve circular spaces of the round window or half storey on the south side with frescoes in chiaroscuro of the twelve labours of Hercules, for which, together with representations of the four seasons in south front, now disappeared, he received £86. Our illustration is from a drawing by Mr. Alfred J. Roddis.

A New Light-house.

THERE has just been completed on the foreland, near Lynton, on the north-west coast of Devon, a new lighthouse, which has been erected by the Trinity House authorities

Modern Stained Glass.

It is to be hoped that the new school of stained-glass work will not be adversely affected by the current discussion with regard to the propriety of placing modern stained-glass windows in ancient buildings. The art is being revived under most favourable circumstances; good work is being done, and there is promise of even better things in future. The practice which is most objected to, that of placing gaudy windows in surroundings absolutely unsuited for them, is one likely to die out now a new spirit has been introduced into this venerable and interesting art, under the influence of which no true worker would for a moment consent to receive a commission, on terms however tempting, for a window in modern ornamentation of an ancient church without a personal visit to the spot, and a thorough and reverent study of the building he was required further

Building over Graves.

AN interesting point recently occurred in a Chancery Court case in which a summons was taken out asking for a declaration that a plot of land situated in Deansgate, Jackson's Row and Bootle Alley, Manchester, comprised in a contract made with the Corporation, formed part of a disused burial ground within the meaning of the Disused Burial Grounds Act, 1884, and the Open Spaces Act, 1887, and could not be built upon for secular purposes. Plaintiff's counsel said the contract was that in consideration of the sum of £11,924 certain hereditaments were to be sold to his client. Upon investigating the title it was found that a plot containing 701 sq. yds. had formed part of what was formerly the burial ground for the members of the Society of Friends, the last interment having been made in the year 1847. The question was whether the purchaser was prevented from building upon it by reason of the provisions of the Disused Burial Grounds Act, 1884. There was another point raised by the Corporation. A section in the Act exempted from its provisions any burial ground which was sold or disposed of under the authority of an Act of Parliament. By the Manchester Waterworks and Improvement Act, 1875, the Corporation were empowered to acquire the land in question, and the trustees who sold to them did so under the provisions of the Lands Clauses Act. The Vice-Chancellor decided that the land was exempted from the operation of the Act, first, because, being the burial ground of Quakers, it did not come within the purview of the Burials Acts, and secondly, because it had been disposed of under the authority of an Act of Parliament. The summons was therefore dismissed.

Fountain Court, Hampton Court Palace.

THE Fountain Court, called so on account of the fountain which was erected by Queen Elizabeth in the Clock Court of Wolsey's Palace and afterwards removed to the new Quadrangle of William III. designed by Wren, does not, strange to say, form a perfectly rectangular space, the north and south sides being 116ft. 10in., its east side 110ft. 1in., and the west only 109ft. The ground floor is an open arcade of semicircular arches supported on rectangular piers of stone; the arches, from the inner sides of which extends brickwork groining, form the roof of the cloisters and support the floor of the state rooms above, and number twelve on the north and south and eleven on the east and west. The height of the cloister is 12ft. The subsidiary carving to the stonework—such as the garlands of flowers within the arches, the stone framework, representing lions' skins, round the windows, and the vases over the communication gallery—was carried out by William Emmitt, but was doubtless performed under the supervision of Grinling Gibbons. It would be futile to try to discover now the precise portions of

THE FOUNTAIN COURT, HAMPTON COURT PALACE. DRAWN BY ALFRED J. RODDIS.

at a cost of about £10,000. It has occupied quite two years in building, as great difficulties have had to be encountered and surmounted. It was necessary, for instance, to carry out extensive excavations, and a thousand tons of concrete were used in the foundations, in addition to which at least two miles of approach roads had to be made. The lighthouse, which stands about 200ft. above the sea, has residences for keepers attached to it, and it will be used for the first time next month.

to adorn. From the advance which has been made it may be hoped that the day of the stock subject is over, and that the benefactor of the future, desiring to present a memorial window to the church of his fathers, will no longer be content to order, as he would so much lead piping or so many hundred tiles, one of those St. Johns or Good Samaritans which the manufacturing firms are willing to supply at a day's notice, leaving it altogether to chance whether the new work shall harmonise with the old, or

be, perhaps, a glaring disfigurement of a beautiful interior. Stock-in-trade stained glass has had a good commercial time of it. Let us now have something fresher and more beautiful.

NEW LONDON INFIRMARY.

ON Thursday last the Prince of Wales, accompanied by the Princess, opened the new buildings for accommodating the aged and infirm poor which have been erected at Ladywell, in the parish of Lewisham, S.E., by the Guardians of the St. Olave's Union, Southwark. The site, which comprises about thirty-four acres, cost £14,131. The scheme is based upon the absolute necessity for additional and improved indoor accommodation in order to properly safeguard the interests of the poor of the Union, and it avoids as far as possible the existing style, arrangement and management of the workhouse building, with much of its present stringent regulations. The scheme also takes into account the strong conviction generally existing that the old and infirm inmates should receive altogether more humane treatment and be surrounded by more generous and home-like conditions than can possibly exist in a workhouse, associated as they must necessarily be with the wasters and ne'er-do-wells who are amongst the regular *habitués*.

General Description of the Buildings.

The establishment is approached from the Ladywell Road; at the entrance is the porter's office and lodge, in close proximity upon the left are the stables and mortuary, and upon the

right the receiving wards. By the roadway which encircles the main blocks the administrative buildings, which occupy a central position, are reached, and upon each side of them are the blocks for male and female inmates. In the rear are the chapels, isolation building, married couples' block, laundry, boiler and engine house, well house and water tower.

The accommodation comprises four blocks for the aged and infirm (336), six blocks for the healthy infirm (324), two blocks for small dormitories (90), one block for married couples (24), an isolation block (10), and receiving wards (28); giving a total accommodation of 812.

The administrative buildings (a plan of which is given on page 451) consist of the committee-room, clerks' office, medical officer's room, dispensary, matron's office, work-room, and stores on the one side, and upon the other the superintendent's house, superintendent's

NEW INFIRMARY AT LADYWELL—GROUND FLOOR PLAN OF A BLOCKS.

offices and stores. In the centre is the dining hall, and at the rear are kitchen, scullery, larders, and mess-rooms for male and female staff.

The A blocks, or infirm wards (see plan), of which there are four, provide upon the ground, first, and second floors the following accommodation:—Large ward for twenty-two, small ward for six, day-room, attendants' room, bath-rooms, lavatories, stores, offices, and verandah. Fire-escape staircases are provided at the end of the large wards, and at the entrance from the main corridor is a lift for service and other purposes to each floor.

The B blocks (see plan), six in number, are intended for the healthy infirm, and consist of dormitories for twelve and ten on the first and second floors, with attendants' room, bathroom, lavatories and offices, and with day-rooms for 54 on the ground floor. Fire-escape staircases are provided for the upper floors; also lifts.

Upon each floor of the C blocks, of which there are two, three small dormitories for five beds are provided, with day-room on each floor and the necessary attendants' room, bathroom, lavatory and offices, with verandahs and fire-escape staircases. These blocks have been specially designed with a view to a classification of the occupants of the establishment.

The married couples' block consists of two floors, with accommodation for six married couples on each. The rooms are fitted as combined sitting and bed rooms, and upon each floor is a general day-room, with bathroom, lavatories and the usual offices. In the isolation building accommodation is provided for five of each sex in two wards, with nurses' room between.

Upon the right after entering the establishment are the receiving wards, in which accommodation is provided for fourteen of each sex, with the necessary attendants' rooms, bath-rooms, waiting-rooms and offices. The first floor of this building is used as stores for the

inmates' clothes, and also for attendants' living-rooms.

The chapels are, as before stated, in the rear of the general buildings, the chapel for members of the Established Church accommodating 200 persons and that for Roman Catholics 150. The mortuary building is placed as near the entrance as possible, and comprises mortuary, post-mortem room, laboratory, viewing-chamber and waiting-room.

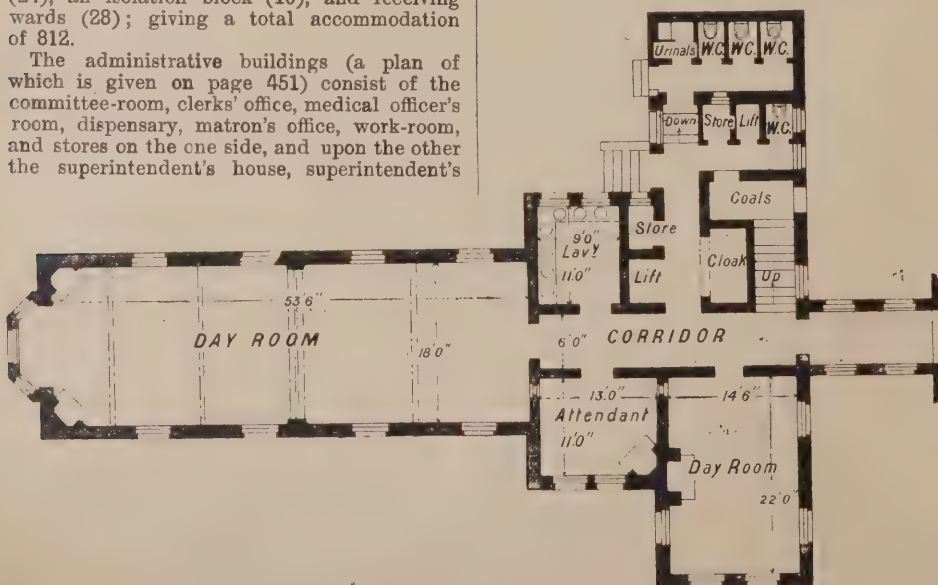

The sleeping accommodation for the male and female staff is provided on the first floor of the administrative building, the sitting-rooms and mess-rooms being on the ground floor, close to the kitchen. Airing courts are placed between the blocks and are laid out with grass and tar-paved walks.

The laundry is entered from the corridor at the back of the administrative building; upon the left of the receiving-room is the foul wash-house, and on the right the general wash-house, in which are fitted three pressure washing machines, two hydro extractors, &c. Passing through the drying closets, which are heated by Messrs. Seagrave and Bevington's patent apparatus, the ironing-room is entered, and fixed in this room are a large steam ironing machine, two box mangles, ironing stove, and the necessary tables for ironing and sorting. The delivery-room opens into the corridor, and the laundry superintendent's office is placed with a view to overlooking the whole of the laundry. All the machinery is driven by electric motors, which are controlled from the engine and dynamo room.

In the boiler house are fixed three Lancashire boilers 28ft. long and 8ft. in diameter, 150 horse power each, and provision has been made for a Green's economiser. These boilers provide the steam required in connection with the warming apparatus, hot-water supplies, cooking, laundry, and electric lighting. The dynamos, of which there are three, are driven by three vertical high-speed engines of 50 horse-power each.

From the engine-room is also supplied the current for the electric motors which drive the machinery in laundry, lifts, and deep-well pumps. The whole of the drainage is taken into the new sewer recently constructed by the London County Council, to which it has an excellent fall. The water supply will be taken from the well, which is 210ft. deep, situated between the water tower and laundry, and which has been found to give an abundant supply of water of excellent quality. The water mains are also connected with the public mains of the Kent Waterworks Company, and a separate supply is provided for the fire mains. The water is pumped from the well in the well house into the tank on the water tower, from which all the tanks in blocks and other buildings are supplied. The whole of the rain-water is collected in a tank close to the boiler house, and the water used for the boilers and in the laundry.

The warming throughout is on the low-pressure system, steam heaters being fixed in the chambers provided under the main corridor, and flow and return pipes being taken into each block to the coils, pipes, and radiators. The hot-water supply is upon the same system. All the pipes for heating and water supply, &c., are

NEW INFIRMARY AT LADYWELL—GROUND FLOOR PLAN OF B BLOCKS.

fixed in the subway under the main corridor, which extends the whole length of the buildings, 744ft. long.

The contractor for the work was Mr. Charles Wall, of Chelsea, S.W., who has also executed the roads and airing grounds. The whole of the engineering works, including boilers, hot-water, heating, laundry, and kitchen have been carried out by Messrs. Clements, Jeakes and Co., of Great Russell Street, W.C.; the well and pumps by Messrs. Baker and Sons, of Southwark Bridge Road, S.E.; the electric lighting by Messrs. Mackie and Co., of Turnmill Street, E.C.; the engines by Robey and Co.; the lifts by Messrs. Waygood and Co.; the telephones by the National Telephone Company; the wood block floors by Messrs. Goddard and Sons, of Farnham; the fire-escape staircases by the St. Pancras Iron Company; the glazed bricks, baths, and sanitary fittings by the Farnley Iron Company; the hot-air stoves by Mr. John Grundy and Messrs. Clements, Jeakes and Co.; and the stoves and ranges by the Albion Iron Company. Mr. F. S. Durston has acted as clerk of the works. Messrs. Newman and Newman, F.R.I.B.A., F.S.I., were the architects to the Board. The cost of the new buildings has been about £195,000.

Keystones.

The Will of the late Mr. R. A. M. Stevenson, the noted art critic, has been proved at £7,117 odd (gross value).

Eglwys Brewis Church, Glamorgan, a thirteenth-century building, is proposed to be repaired at an estimated cost of £500.

Bury's New Market.—A new market is to be erected at Bury on the Fair Ground. Mr Archibald Neill, of Leeds, is the architect.

A new Rectory House at Keighley for the Rev. H. J. Palmer, is to be erected from plans by Messrs. J. B. Bailey and Son, of that town.

A Memorial Window in the Free Church, Dunnichen, N.B., has just been erected. It is the work of the Royal Establishment of Munich, Bavaria.

A Collection of Water-colour Drawings of Cairo by Mr. R. M. Chevalier are now on view at the Princess' Gallery, 41 Jermyn Street, W. Many of them are architectural.

New Board School at Farsley, Leeds.

The Calverley School Board are about to erect a new school in Wesley Street, Farsley. The plans have been prepared by Mr. W. Bailey, of Bradford.

A new Riverside Walk at Durham has been constructed at a cost of about £800. It lies between Framwellgate Bridge and the Prebend's Bridge, and is to be known as Lambton Walk.

Tenders for Cardiff's new Town Hall.—It has been agreed to extend the time for the submission of tenders for the proposed new Town Hall at Cardiff from July 30th to a date to be fixed.

New Banking Premises at Ripon.—New premises for the Yorkshire Banking Company are about to be erected at Ripon. Messrs. Bedford and Kitson, of Leeds, have prepared the plans.

Lifting a Roof.—The roof of the Central District Board School at Southampton has been bodily lifted in order to provide a second floor and more accommodation. The roof weighed 120 tons.

The Victoria Almshouses, Ardsley.

—What will be known as the Victoria Almshouses are to be erected in the village of Ardsley, near Barnsley. Mr. J. P. Kay, architect, of Leeds, has prepared the plans.

Proposed new Mission Premises in Central London.—It is proposed to spend about £60,000 on the acquisition of a site and the erection of new mission premises in Central London, not far from Wesley's Chapel.

"The Bell" at Edmonton is to be offered for sale shortly. Cowper's description of John Gilpin's ride to "The Bell" is known to everyone. Charles Lamb always took his friends there during the latter part of his life, which was spent at Edmonton.

In Memory of Turner.—The tablet which Mr. Walter Crane has designed for fixture upon the front of No. 119, Cheyne Walk, Chelsea, the house in which Turner died, will shortly be placed in position. It is being executed in lead, and will bear a brief inscription.

Proposed Stratford Spa.—A scheme is on foot for purchasing certain lands belonging to the Stratford-on-Avon Town Council, forming part of the Rowley estate, erecting on them a hydropathic hotel and pump-rooms, and constructing winter gardens. It is understood that the promoters are willing to spend £40,000 on the works.

Gresham's School, Holt, Norfolk.—Plans are being prepared for building, within a quarter of a mile from the town of Holt, a head-master's house and school premises, with all modern requirements, including chemical and physical laboratories. Accommodation will be provided for about 200 boys, of whom about 60 will be boarders.

Municipal Building Scheme at Warwick.—The Warwick Town Council have decided to apply for sanction to borrow £3,500 for the purchase of common land, known as the Pigwells, for building purposes. The Council propose to improve a road, drive another road through the new property, and sell the remainder for the building of cottages.

Cottage Hospital for Radcliffe.—It is the intention of Mr. A. Bealey, of Manor House, Bury, to build a cottage hospital for convalescent purposes and to present it to Radcliffe. The hospital will be erected on land at Radcliffe Close, about an acre and a half in extent. The plans have been approved by the Streets Committee of the Radcliffe District Council.

A Peking Cathedral—M. Favier, the Roman Catholic Bishop of Peking, holds (or held?) the local rank of Mandarin of the grade equal to that of the Governor of a province. His palace and cathedral church and other missionary buildings are (or were?) situate in the Yellow or Imperial quarter of Peking, almost adjoining the Imperial Palace. The cathedral was built at the expense of the Emperor, and cost more than £30,000—two

NEW INFIRMARY AT LADYWELL. GROUND FLOOR PLAN OF ADMINISTRATIVE BUILDINGS.

NEWMAN AND NEWMAN, F.R.I.B.A., F.S.I., ARCHITECTS.

Chinese kiosques facing the main entrance to the cathedral bear inscriptions recording the Emperor's gift.

A New Suburban Theatre, to be called the "Marlborough," is to be erected on the site of the Parkhurst Theatre, in the Holloway Road, and about 120ft. of the land immediately adjoining. The site is now being cleared, and the plans for the new theatre have been approved by the County Council.

The Yorkshire Federation of Master Painters held their annual picnic last week. The members assembled at Thirsk, and drove over the Hambleton Hills to Rievaulx, visiting the ancient abbey and the terrace. They dined together at the Fleece Hotel, Thirsk, Alderman Kendall, of Huddersfield, presiding.

The Hanging Bridge, Manchester.—A deputation (including Mr. F. H. Oldham, president of the Manchester Society of Architects) recently waited on the Improvements and Buildings Committee to ask if they would preserve and expose to public view the Hanging Bridge at Manchester disclosed by the widening operations at Victoria Street, near the Cathedral. The chairman of the Committee said that no precipitate action would be taken in the matter. (For further particulars of the bridge see p. 172 of our issue for April 11th last.)

Wigan Technical College.—On Wednesday last the Countess of Crawford fixed the memorial tablet of the new Mining and Technical College, Library Street, Wigan. The site, 3,000 sq. yds. in area, has been exchanged by the Wigan Council for the site of the old school freehold, and the building will cost about £40,000. The new college is being erected according to the plans of Messrs. Briggs and Wolstenholme, architects, of Liverpool and Blackburn, and will include a hall to accommodate 700 persons, and an engineering drawing department for 100 students; while there is adequate accommodation for students in various other departments.

A Kendal Architect's Claim for Work Done.—At the Lancaster Assizes Mr. John Hutton, architect and surveyor, Kendal, recently sought to recover £147 for professional work done for a licensed victualler of Sedburgh. The defendant disputed the claim on the ground that the work done was unsatisfactory, owing to want of skill and negligence on the part of the plaintiff. The defendant also counter-claimed. The Judge held that the defendant could not legally recover, as an architect was not a guarantor but an adviser, and was not expected to guarantee when certain work would be completed. The jury found a verdict for the plaintiff for £118 11s. 3d. They dismissed the counter-claim.

A Case about a Trade-mark.—The case of *Hubbuck and Son, Limited, v. W. Brown, Sons and Co.* was heard in the Court of Appeal on Friday last. The plaintiffs sued the defendants for infringement of trade-mark, and also for getting up their goods so as to resemble the plaintiffs'. The defendants were paint manufacturers in Glasgow, and sold their paint in kegs of the same shape, size and material as the plaintiffs' kegs, but it was conceded that these features were common to the trade. The main ground of the plaintiffs' complaint was that the defendants' goods were so got up as to enable them to be sold in Spanish-speaking countries under the name "Dos Leones," which had come to denote the plaintiffs' goods. The Court dismissed the appeal.

Extension of the Law Courts.—Mr. Akers-Douglas said recently in the House of Commons: The buildings to be erected on the vacant site to the west of the Law Courts are four new courts and their adjuncts, which will form part of the Royal Courts of Justice, and must be in structural communication therewith. The extension will occupy about one-sixth of the area of vacant ground, which was temporarily laid out as a garden by the generosity of Mr. Smith, but was acquired and was always intended for an extension of the courts when needed. As the essential object in view in the erection of the Royal Courts of Justice was the concentration of the legal business of the country, the Government could not view favourably the suggestion to erect additional courts elsewhere.

Engineering Notes.

The Rotherhithe-Shadwell Tunnel.

—A Select Committee of the House of Commons had before them last week a Bill promoted by the London County Council to construct a tunnel under the Thames from Rotherhithe to a point near Shadwell Market. The tunnel would run for 1,662ft. beneath the river bed, but with the approaches would take a mile and a quarter of roadway on easy gradient. The estimated total cost, including approaches, is £2,198,250.

Messrs. John M. Henderson and Co., engineers and hoisting and transporting machinery makers, King Street, Aberdeen, are building additional buildings, at a cost of between £5,000 and £6,000. Messrs. Brown and Watt are the architects. The area covered will give in ground floor space about 14,000 square feet, but the greater area will be occupied by a two-storey building, which will give 9,000 square feet or thereby of additional working floorage. New offices are provided for in the buildings. The carpenter work is being carried out by Messrs. Watt and Clark, slating by Mr. Alexander Murray, and the masonry by Messrs. Fordyce and Co.

The New Waterworks at Earlestown, Lancs., are now approaching completion. Two boreholes have been made, 100ft. apart, and the water will be raised by two 13-in. pumps and discharged into a covered concrete tank, capable of holding 200,000 gals., or a day's supply. From this tank the water will be raised by a pair of double-acting horizontal pumps, and discharged direct into the mains. A reservoir and high-level tank will, in the near future, be constructed. The works have been designed by and carried out under the supervision of Mr. D. H. Lloyd, gas and water engineer to the district council. The estimated cost of the whole scheme is £23,000; the first section will cost about £6,000.

Public Works in New South Wales.

—The progress of New South Wales as regards its public works is clearly indicated in the annual report of Mr. Robert Hickson, M.Inst. C.E., the Under-Secretary for Public Works for that colony, which has recently reached this country. In his statement of the operations of his department during the twelve months ending June 30th, 1899, Mr. Hickson first refers to the gross expenditure for the year, which amounted to £2,165,818 14s. 11d. Tramway construction cost £174,605 16s. 8d.; country towns' water supply, £42,789 7s. 7d.; water conservation, irrigation, and drainage, £13,666 15s. 4d.; Government architect, £270,989 6s. 3d.; roads and bridges, £644,068 6s. 6d.; and sewerage construction, £202,826 16s. 8d.

A West-End Lighting Improvement.

—An important scheme of electric lighting will be completed within a very few days. It comprises the Vestry of the Parish of St. Martin-in-the-Fields, the "Royal Parish," inasmuch as it includes Buckingham Palace. The area extends in a line east and west from Drury Lane to the Palace, and in the opposite direction from the Horse Guards to Long Acre. For the first seven years—the period during which the instalments of capital and interest on the amount borrowed will be paid off—the annual extra cost will be about £1,400, which is but a small consideration for the inhabitants and tradespeople in the following highly important streets and thoroughfares, all of which are now electrically lighted:—The Haymarket, Panton Street, Whitcombe Street, Leicester Square, Pall Mall East, Cockspur Street, Charing Cross, Whitehall, Whitehall Avenue, Whitehall Place, Northumberland Avenue, Villiers Street, the Strand, Agar Street, Duke Street, King William Street, Chandos Street, Adelaide Street, Duncannon Street, Trafalgar Square, St. Martin's Place, St. Martin's Lane, Charing Cross Road, Green Street, Garrick Street, Cranbourne Street, Long Acre, Bow Street and Endell Street. The electric standards have already been criticised by us, and their bad design need not be pointed out again.

Trade and Craft.

The Huge Cement Combine.

It is perhaps news to some that the term "Portland cement" was first given by a Leeds bricklayer named Aspdin seventy-six years ago to an artificial compound of lime and clay prepared by him which had a fancied resemblance to the oolitic limestone of the island of Portland. In 1825 Aspdin erected works at Wakefield, and the success of the new material became assured, Brunel using it a few years afterwards for the Thames Tunnel. The price then, by the bye, was about 22s. a cask. At the present time the chief centre of the trade is on the Thames and Medway, the first factory having been established at Frindsbury, near Rochester. Year by year the demand increased, new factories were erected, until now the output is enormous, and Portland cement has become one of the most important of the materials used in building and constructional works. As will be seen from the prospectus printed on another page, it is now proposed to amalgamate all the thirty Thames and Medway firms (that is, practically the whole trade, because 80 per cent. of the output is produced at the places named) under the title of the Associated Portland Cement Manufacturers (1900), Limited, the capital of which consists of no less than £2,500,000 cumulative preference shares, £2,500,000 ordinary shares and £3,000,000 first mortgage debenture stock. The objects are to avoid fluctuations in profits, to improve the manufacture, and to lower the cost, while the tendency to cut prices in the winter will be avoided. It will be seen that the profits made have been considerable, and, with the introduction of new machinery and new facilities, should be still larger, so that the amalgamation is one which should find an eager public ready to share in the benefits offered. It should be noted that the capital is not underwritten.

Tiles for Decoration.

The application of tiles to the decoration of the walls and floors of buildings is no new thing. The triumphs of the Persians, the Arabs and the Moors in this method form one of the brightest chapters in the whole history of ceramic art. It is impossible for the modern tile-maker in some respects to attempt rivalry with these glorious productions of the past, as the great demand for his wares is no longer for the decoration of palaces and mosques, where cost and time are not of the first importance, but for the decoration of houses, shops and public buildings where price and time are most important factors in controlling the employment of any material.

It is no longer possible to produce the tiles required for modern purposes by the patient labour of the hand. Machinery has been called in to expedite matters, though unfortunately, in many cases, this gain has been more than counterbalanced by the loss of all artistic quality in the work produced. The aim of Pilkington's Tile and Pottery Company, Limited, of Clifton Junction, near Manchester, is to demonstrate that the absence of artistic merit is not a necessary accompaniment of modern methods of manufacture. Under the able artistic guidance of Mr. Lewis F. Day they have gathered together designs by such well-known artists as Mr. Walter Crane, R.I., Mr. C. F. A. Voysey, Mr. Edgar Wood, and Mr. Day himself, in addition to the work of younger decorative artists of promise, among whom we may mention Mr. John Chambers, Miss Florence Steele and Mr. J. R. Cooper; and the exhibits now at the Paris Exhibition show how excellent is the result. The firm do not claim to have solved more than a few of the problems which beset the application of tile work to the decoration of modern dwellings, but at all events they have brought scientific knowledge and artistic skill to bear on the problem of workshop production in a greater degree than has ever been the case in England before in the manufacture of tiles; a feat which deserves high praise.

Emery Grinding Machines.

Messrs. Poth, Hille and Co., engineers, merchants and manufacturers, of 27 Leadenhall Street, E.C., are the makers of the very handy foot-power emery grinding machine called the "Excelstor," illustrated below. It will do all kinds of work in one-fourth of the time required on a grindstone; it can be attached to any work-bench; it will do three-fourths of the work usually done with a file, and is invaluable for light work. The wearing parts are few and can be renewed at little cost, and there is nothing complicated in the construction; the machine weighs but 20lbs. The wheels are adapted to produce a perfect edge and not to draw the temper of the tools, and a speed of 3,000 revolutions a minute can be maintained without much exertion. The price complete with a 6in. wheel $\frac{3}{4}$ in. thick, and an adjustable tool-

EMERY GRINDING MACHINE. BY POTH, HILLE & CO.

rest, is only 25s. The firm also make all kinds of grinding and polishing machinery, the chief features of which are that good design is combined with good workmanship and compactness with serviceability.

Leaky Chimneys.

A good deal of trouble is occasionally experienced, especially in old buildings, from the leakage of chimneys. Smoke and smell from this cause are found in different parts of the house, and the mystery is whence they come. Wainscotting and other wall coverings, as well as floors and ceilings, very likely hide the actual cracks in the brickwork, and so make the discovery of the mischief difficult; and, in addition to causing smoke and smell, these leaky chimneys are a great source of fire-risk in buildings. By the use of the air-pump with scented air the faulty places in the chimney can be traced and rectified. The pump, which is made by Messrs. Alexander Boyd and Son, of 105 New Bond Street, London, W., consists of a long box or cylinder in which a piston (somewhat like that in an ordinary force-pump) is worked to and fro by a handle. A perforated metal box contains saturated tow or dry tobacco, and scent is thus forced with the air into the suspected space through the outlet nozzle. All old houses should have their chimneys occasionally tested in some such way, so as to avoid even an alarm of fire, and this pump should therefore find a ready market.

Acetylene Gas Lighting.

The Acetylene Illuminating Company, Ltd., have furnished us with a pamphlet in which are very clearly set forth the merits attaching to the new illuminant, acetylene. It will be remembered that this company possesses the right in the British Isles of manufacturing the carbide of calcium by means of electrical furnaces under the Willson patent. What appeals to us most in this little work is the honesty and modesty of the claims made for the new gas. No attempt has been made to prove that acetylene is the cheapest light. It is admitted that it comes behind electric and incandescent gas light. But in many places these lights are not procurable, and in such a case acetylene is then the most suitable illuminant in the market. Acetylene gas should not be confused with liquid acetylene, which is a most powerful explosive, and is prohibited in this country. Many persons interested in the suppression of the new industry have helped to foster this confusion in the public mind, and much damage has also been done to the prospects of acetylene by the makers of ill-designed generators, and by the exploitation of the gas for bicycle and other lamps, for which purpose it is quite unsuited. If it is regarded and treated in every way like coal gas it will be found most satisfactory and quite harmless. To country photographers it should be invaluable, for it is the most suitable light known for photographic operations, and we have had experience of it in this respect.

New Companies.**European, British and Colonial Lands and Buildings Company, Limited.**

This company was registered on July 6th with a capital of £5,000 in £1 shares.

Tilbury and Stanford Brick Co., Ltd.

This company was registered on July 5th with a capital of £15,000 in £1 shares. Registered office: King Street, Stanford-le-Hope, Essex.

The Western Quarries, Limited.

This company has been registered in Scotland with a capital of £10,000 in £1 shares to acquire and develop quarries or mines.

McLintock's Paint and Compositions Company, Limited.

This company was registered on July 4th with a capital of £12,000 in £1 shares to carry on the business of chemical manufacturers and merchants, &c. The number of directors is to be not less than three nor more than seven; the subscribers are to appoint the first. Registered office: 64 Moorgate Street, E.C.

W. Key and Son, Limited.

This company was registered on July 9, with a capital of £25,000 in £1 shares, to acquire the business carried on by T. H. Norris at Great Berkhamsted, Hertfordshire, as W. Key and Son, and to carry on the business of timber merchants and importers, sawmill proprietors, timber growers, veneer cutters, &c. The first directors (to number not less than three nor more than five) are T. H. Norris, E. C. Hall, W. Wilkinson, and J. Mitchelmore. Registered office: Castle Wharf, Great Berkhamsted, Hertfordshire.

Eltringham Sanitary Pipe and Brick Company, Limited.

This company was registered on July 2nd with a capital of £5,000 in £1 shares to acquire the business carried on by W. Ferguson, R. Herron and W. Dodd, at Eltringham, Northumberland, as the Eltringham Sanitary Pipe and Brick Company, and to manufacture and deal in bricks, tiles, pipes, pottery, &c. The first directors (to number not less than three nor more than five) are R. Herron (chairman), W. Ferguson, J. Elrick, J. W. White and W. Dodd. Registered office: 24 Grainger Street West, Newcastle-on-Tyne.

COMING EVENTS.**Wednesday, July 18.**

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Half-yearly meeting of the members.

Thursday, July 19.

INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—Twenty-seventh annual general meeting at Westminster Town Hall. (First day.)

Friday, July 20.

INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—Annual meeting. (Second day.) ROYAL ARCHITECTURAL MUSEUM AND WESTMINSTER SCHOOL OF ART.—Annual meeting at the Museum at 4 p.m.

Saturday, July 21.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS, NEWCASTLE-UPON-TYNE.—Council Meeting at 1.30 p.m.

INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—Annual meeting. (Third and last day.)

Thursday, July 26.

SOCIETY OF ARCHITECTS.—Meeting at the North-Western Hotel, Lime Street, Liverpool, to ascertain the attitude of Provincial architects on the Architects' Registration Bill. 6 p.m.

CONTRACTS OPEN.

EPSOM URBAN DISTRICT COUNCIL.

The Council are prepared to receive APPLICATIONS from Builders willing to Tender for the ERECTION of an ELECTRIC SUPPLY STATION at the rear of their Offices in Church Street, Epsom.

Builders must send in their names to the Architect, Mr. A. E. PRIDMORE, 2 Broad Street Buildings, E.C., together with £2 2s. for the bills of quantities, which will be returned on receipt of a bona-fide Tender.

Drawings and specifications may be seen at the offices of the Architect and of the Town Surveyor, Epsom.

The builder shall under a penalty of £50 observe the rates of wages obtained in the several trades employed.

Tenders are to be delivered at the Clerk's Offices, Epsom, on or before FOUR o'clock, on JULY 25th inst., on the printed forms supplied.

The Council do not bind themselves to accept the lowest or any Tender.

Epsom, July 1900. By order, E. G. WILSON, Clerk of the Council.

EPSOM RURAL DISTRICT COUNCIL.

CHESSINGTON WATER SUPPLY.

The above-named Council are prepared to receive separate TENDERS for:—

1. Supplying about 2,688 yards of 3-inch Cast-Iron Water Pipes, with valves, hydrants, and other fittings.

2. The Excavating of Trenches, the Carting and Laying of the Pipes, and the Fixing of Hydrants, &c.

Specifications of the works can be seen at my Office, or at the Office of the Surveyor to the Council, Waterloo Road, Epsom.

Tenders, upon prescribed forms (to be obtained on application), must be delivered at my Office not later than NOON on FRIDAY, the 27th day of JULY, 1900, addressed to "The Chairman, Epsom Rural District Council, Lonsdale, Epsom."

The Council do not bind themselves to accept the lowest or any Tender.

Lonsdale, Epsom, July 1900. By order, W. O. READER, Clerk to the Council.

COMBINED MESH NETTING.

Averages 20 per Cent. Cheaper than Ordinary. Lists Free.

WROUGHT IRON WINE BINS.

BEACONSFIELD URBAN DISTRICT COUNCIL. TO CONTRACTORS.

The Urban District Council of Beaconsfield are prepared to receive TENDERS for the CONSTRUCTION OF WORKS of SEWERAGE, comprising about 5,000 lineal yards of Stoneware Pipe Sewers, Manholes, &c.

The drawings may be inspected between the hours of TEN a.m. and FOUR p.m. at the Office of the undersigned Clerk to the District Council, at No. 11 Mackenzie Street, Slough, when a copy of the specification, schedule of quantities, and form of Tender may be obtained upon depositing a cheque for £2s., which will be returned on the receipt of a bona-fide Tender.

Sealed Tenders, on the form of Tender attached to the specification, must be addressed to the undersigned, endorsed "Tender for Sewerage Works," and be delivered at No. 11 Mackenzie Street, Slough, aforesaid, on before the 25th July. The Council do not bind themselves to accept the lowest or any Tender.

G. H. CHARLEY,
Clerk to the Urban District Council.
Slough,
July 1900.

CITY and COUNTY BOROUGH of CANTERBURY. NEW LUNATIC ASYLUM. CONTRACT No. 2.

The Visiting Committee of the New Asylum at Stone House, Canterbury, invite TENDERS for the COMPLETION OF BUILDINGS and other Works in connection therewith, in accordance with drawings and specifications, which may be seen at the offices of the undersigned, where also copies of the bills of quantities may be obtained on and after the 16th JULY, on depositing the sum of £10, which will be returned on receipt of a bona-fide Tender.

Tenders on the forms supplied are to be sent to the Chairman of the Committee of Visitors not later than THURSDAY, the 2nd AUGUST, at SIX p.m.

No pledge is given to accept the lowest or any Tender.

VESTRY OF THE PARISH OF FULHAM. TO BUILDERS AND OTHERS.

The Fulham Vestry hereby give notice that they will be prepared at their meeting, to be held on WEDNESDAY, the 25th day of JULY, 1900, to receive TENDERS for the ERECTION OF STABLES (for about 50 horses) and other Works in connection therewith, in extension of their present stables in Munster Road, Fulham.

Quantities and forms of Tender are now ready for delivery, and will be supplied on application to Mr. CHARLES BOTTERILL, A.M.I.C.E., Surveyor to the Vestry, upon payment of a deposit of Two Guineas, which will be returned on receipt of a bona-fide Tender.

The conditions of contract, specification, and drawings may be inspected any day, between TEN and FOUR o'clock, at the Surveyor's Office, Town Hall, Walham Green.

The contractor will be required to sign a declaration that he pays the trade union rate of wages to the several trades that will be employed on the works, and all unskilled adult labour the minimum rate of sevenpence per hour.

Sealed Tenders, with priced bills of quantities, to be delivered before FOUR o'clock on the above-mentioned day. The lowest or any other Tender not necessarily accepted.

By order,

W. J. H. DENSELOW,
Clerk to the Vestry.

Art and Social Revolution.

SOCIAL REVOLUTION, its causes, influences, and, above all, its effects, is a

matter of discussion which is very near to the actual course of events in this present age. History marches upon its irresistible course in many and various ways, and by many and various methods: yet of all its methods, and of all its modes of travel, it brings to pass the greatest changes, good or ill, in the shortest time by the aid of Social Revolution alone. I will not discuss the causes which promote such a state—war, the gradual awakening of a People to a sense of wrongs, of grievances unbearable, or the mad flame of hatred and of blood which springs suddenly into being, like the French Revolution. All these bring about that rousing self-reflection which must ever prove itself a blessing to any nation of strong intellectual stamina; and it is this I wish to look into, examining the effect of Social Revolution upon one branch of our English intellectual effort—our artistic national mind.

To go back into history for proof of what I wish to say will be easy. Let us take for example that wonderful art life of the Greeks, the Greeks who accomplished so much—the splendour of form and beauty in their sculpture, the most perfect architecture the world will probably ever know, and the birth and maturity of a literature which has never been surpassed. Yet all this was practically accomplished and consummated within the life of one man, who lived, it is true, somewhat beyond the average grant of years. Not only was this marvellous record built up within so short a time, but while continuous revolt and war were going on—civil war between city and city, and the great invasion of Xerxes, when the tiny army of the Greeks, which stood for all the civilisation of the world, swept back in a truly miraculous manner the tide of Persian invasion which so nearly overwhelmed them. If we take the history of Venice—Mistress of the Seas, as Ruskin calls her—we shall find here that her artistic vigour was impaired and sapped by the insidious forgetful ease and sluggishness of peace; her wars saw her supreme politically and (excepting Florence) supreme artistically. The growth of Gothic art progressed through all the tumult of the forma-

tive wars of Northern Europe, while the great birth of the Renaissance came at that critical revolutionary time when the Holy Roman Empire was in its final death throes and the modern European States were in the making.

How can it be doubted, extraordinary as it may seem, that Revolution promotes artistic movement, when Assyria, that most militant of ancient empires of Asia, had such a vigorous creative art throughout the period of long wars of conquest? These examples from history should be sufficient to show that there is a link of connection between such patently alien influences as Art and Revolution. To examine into the nature of the link, seeking the reasons for such connection, is more difficult and can only be imperfectly hinted at here; yet we can go a short way towards getting the truth.

Carlyle has claimed that War and Revolution—social, political or artistic—in reality spell Evolution for mankind. Such disturbances, he says, shake the torpidity from the

ease and placid peaceful skies, and now out of sheer wantonness they interpret force as torpidity, art as commercialism, morals as maxims merely, and that fine spirit of sincerity as a lifeless sham. They think they can dispense with that great moving spirit, Force, so they heap him over with conventionalisms, call him uncouth, and cover him with a dainty tissue of eccentricities, and say it is Art. But it is not Art, and never will be, while the Force is absent. What Matthew Arnold demanded of the highest poetry will apply to us here. It must, he says, deal with the fundamental basis of things, with life and death and their problems, with "joy in widest commonalty spread," and Art must do the same. If, through the stress and trouble of Revolution, Art can find a way for the expression of Wordsworth's great hope—can find a way to "joy in widest commonalty spread," there will be an undertone of hope in the complaint of wars and rumours of wars, with their apparent hark-

CHURCH ON THE ARDMORE ROAD, ARDMORE. DRAWN BY H. F. WARING.

liver of a nation until it regains its real moral and intellectual health and ascendancy, which had been tainted by the continued sweets of peace. There can be little doubt that such changes shake a people to the very heart. It is vital to them, and brings them *real feelings, real thoughts, and real ideas* very different from the assumed mediocre emotions of a commercialised peace. It takes them back to primitive facts, the broad chances of life and death, with all the grim brutality as of a return to barbarous existence.

In all this there is one thing, and that is Force, which will redeem any art from the commonplace, any mind from the sham. Why is primitive art so engrossing? Why is that crude Early Gothic sculpture so fascinating? Because of its vitality, its force. It is this force, this living spirit of strong vitality coerced into art which makes it live, almost breathe, and irresistibly appeal to us degenerates of weak nerves and idle senseless conventionalisms. The people of to-day have had a fulness, a surfeit of uneventful

ing backward to barbarism. "Give me hatred," says Carlyle, "but not indifference," and we must demand of our Art either love or hate, but not indifference. We are not, I think, indifferent to-day, but there is much to hate, and, this being so, still are there wide realms to conquer, vast stretches of territorial shams to go down before determined onslaught; and truly this is a noble heritage for artistic futurity.

In speaking as I have done of Force in this article I do not disclaim the benefits of culture. Having once gained our force it must perhaps be civilised, made to conform to art standards, but the fact of its presence is imperative. This alone gives the element of inevitability to any effort, and inevitability is the sign of power, the sign of real imperishable merit in any work.

It will not, I hope, be taken from this that I counsel against peace, my object being rather to show the compensating advantages of war, and truly they are great; yet without peace they would be as nothing. F. B.

Speculative Building.

THE vast majority of speculative building may be described as the compounding of a showy exterior and a moderately-convenient interior with a cheap, unsound and unenduring fabric; or, to dignify the definition, we may call it a combination of inexpensive pseudo-art with a feeble imitation of scientific method. It is no child's play to unite these qualities, though, to the layman, it may seem the very quintessence of ease; but, all these difficulties being solved, What does it matter to the builder if cracks do appear within a year? What if the beautiful tuck-pointing does lose its gaudy effect after a few rainstorms? These are mere details which we can scarcely expect the builder to foresee 'mid the maze of endless items which beset him at every turn—items (to mention but few) of doors and windows, ornamental stone window and door heads ordered by the gross (possibly from some foreign source), and the building all the time needing to be reared up around them! Then, too, what an anxious time is it for him until that bond of stability, the wall-paper, is duly fixed!

We are told that we live in progressive times, and that to avert the catastrophe of being behind the times we must move with them—a fact which is fairly obvious; but on taking any average suburb, and on noting the buildings recently erected and in course of erection, can we, applying to this question the statement enunciated above, cajole ourselves into believing that domestic building, not to say architecture, has moved with the times? Of course, if the times tend to show an advance in instability—moral, social, and material—and in the art of concealing that instability, then we may be very well sure that we are advancing with the times. Though their powers are perhaps somewhat exceeded in some cases, the various local Boards of Works are, it is very generally admitted, doing inestimable good in checking the erection of flimsy dwellings, and the plea of the builder is that he cannot afford to spend more money upon other parts of the fabric, because the by-laws of the Boards are so strict and require absolute satisfaction in the matter of drainage, foundations, thickness of walls, &c., parts which it must be to everyone's interest to have properly built. It is a strange fact that the public, the ultimate dwellers in and possessors of this class of property, do not seem to realise that it is a penny wise and pound foolish policy to stint the builder in these operations; for, in the majority of cases, speculative builders only do what they do, knowing that they can obtain but a certain sum for a completed house; therefore they argue, "Why should we spend money on improvements, although necessary, which the purchaser neither sees nor appreciates?" We should reduce our profit without conferring any known advantage upon the purchaser." This is but the outcome of present-day circumstances. The case seems to resolve itself into the fact that, until the public are prepared to esteem at their proper value the benefits of sound building, and to pay for them accordingly, all that is to be expected is the determination of the builder to keep to his well-practised methods, only doing enough to satisfy the official building inspectors and to make the building apparently inhabitable.

G. P. K.

On Reflection.

Water-Gas.

THE subject of water-gas cropped up in the House of Commons last week on a question concerning the report of the special committee appointed to enquire into its uses and abuses. The sooner the Government bring in a Bill to regulate its uses the better for the general health of the community, for there is not the slightest doubt that gas companies are making too free a use of this deadly poisonous gas. There are many reasons for this. The plant required takes up little space and is not very costly as gas plant goes, the gas is easily and quickly made, and the company can use up its own coke, which is a great advantage. Practically the only material required is the oil for the carburetting. It follows, therefore, that the gas is very cheap, and the temptation to gas managers to dilute their coal-gas with water-gas and so save their coal bill is very strong. Now that coal is very dear, and likely to be still dearer, who can doubt that the gas companies will manufacture greater quantities of water-gas to minimise their expenditure? We are not among those who urge the total abolition of this gas, for it has its legitimate uses. It must be remembered that gas is used now for other purposes than lighting—for driving engines, brazing and other work—and the consumption of gas in such ways, depending as it does upon the state of trade, is liable to fluctuations and is difficult to calculate. Consequently a gasworks manager feels the necessity of a water-gas plant which will enable him to eke out his coal-gas supply and quickly meet any urgent or large demands upon his stock by reason of a sudden briskness in the work of the surrounding factories. Only those people who have worked on gasworks know how sudden and urgent such demands may be. Furthermore, it is desirable that gas for motive power should be as cheap as possible, and the dilution of coal-gas with water-gas should go far to aid in a reduction of price. But its cheapness has ensnared the gas companies into making it for ordinary purposes, instead of for extraordinary purposes and emergencies, and some legislation is therefore urgently required to regulate this abuse, and to enforce upon the companies a somewhat stricter attention to the question of public health.

More Water for London.

WE are glad to see that the East London Waterworks Company are coping vigorously with their difficulties. The ill-advised opposition of the London County Council to their Bill last year has not deterred them from bringing in a fresh Bill this year, and, what is more, it has been passed. Under this Bill they will be enabled to bring up their storage capacity to the enormous amount of 7,500,000,000 gallons, and they are also enabled to get additional supplies from the Thames in case of exceptional drought. That this is a step in the right direction no one can deny, and we venture to say that the London County Council could not have propounded a better scheme in connection with these works. We have little doubt that there will be a good deal of anger among the agitators, and no doubt we shall hear the old cry of "No monopoly" and the stock argument that water is the gift of Providence to man and should be free. This is correct so far as it goes, but Providence has not yet assumed the task of laying mains and services, digging

wells and building reservoirs and pumping stations, and these things cost money, whether they are done by a municipality or a private company. Personally we think the water supply should be under the public control, but if the responsible authorities were inert in the past we cannot now blame the private company for taking advantage of their want of foresight. Ill-judged and, to any water-engineer, absurd criticisms were passed on the East London Water Company when their supplies broke down through wanton opposition to their preventative schemes, but of all water companies this has the worst sources of supply—the uncertain and fluctuating River Lea, from which another company has first taken toll, and deep wells. There are no other sources of supply, so that the policy of huge storage reservoirs to take the extra water during rainy weather is highly commendable. There is one other point upon which we would like to insist—and this concerns all the London waterworks—the necessity of strong defensive works or fortifications to guard all approaches to our water supplies. In case of invasion, not quite so improbable as some people might think, the cutting of London's water supply would be followed by results too horrible to contemplate. If London's water supplies were cut the greatest army in the world could not prevent the fall of the city, and three-quarters of her inhabitants would perish from disease. Probably the London County Council never contemplated the superhuman task of defending their Welsh Water Supply from an invading force.

Shop Blinds. THE London County Council sometimes ex-

hibits a propensity for straining at the gnat and swallowing the camel. One can frequently read in the reports of its meetings that permission was refused to some theatre proprietor or entertainment caterer to erect a glass and iron awning outside his premises for the comfort and protection of his patrons. Permission to erect such structures is one of the Council's prerogatives; but while they jealously guard the privilege it does not appear that they exercise any disciplinary influence over the outside shop blind. In the old days it was rare for a shop window to be less than 2ft. above the pavement; but the great object of to-day is to get every inch of window space that is possible, even if the building suffers architecturally. Incidentally this craze for plate glass is an additional source of danger to the pedestrian, because an accidental slip or push may precipitate him through or partially through the window, with dangerous or fatal results. But it directly affects the blinds, for these must project more and hang lower to cast sufficient shadow to cover the glass. When sun blinds were only used as sun blinds no harm came, but some enterprising shopkeeper appears to have left his shop blind down in wet weather and to have been rewarded with additional patronage by the folk sheltered under it. At any rate the majority of them are down now in wet weather, and the result is that no man of average height, say 5ft. 8in., can walk along the pavement with his umbrella up without the umbrella or his hat or both being wrecked by the cross bar of a shop blind. Shop blinds are merely a graceful concession to the shopkeeper to prevent goods being damaged and his shop being converted into an oven. And we doubt not that, if necessary steps were taken, they could be abolished. Such an extreme step, however, is not desirable, because the public also derive some benefit from them in both wet and fine weather. All that is necessary is a by-law which will enable the County Council to regulate their use and erection and prevent them degenerating into a public nuisance.

MR. WALTER H. BRIERLEY.

MEN WHO BUILD.

No. 60

Messrs. DEMAINE and BRIERLEY.

IT is a nice question whether or not it is advantageous to an architect to have his residence and professional practice centred in an ancient cathedral city. Later works are all overshadowed in such places by the grand historic relics of all the architectural periods since Norman times, and your average sightseer resents as an intrusion anything later than (let us say) the early Georgian era. He begrudges the modern growth which inevitably in our populous and still growing country radiates from the mediæval nucleus, and in his mind he resents, although the resentment may find no expression on his tongue, the snug villas that perhaps for a mile or so around enfold the original city that our forbears knew and that by comparison seems now so small. Only when England begins to decay and her population to dwindle will the tourist of that future era find his sense of the romantic and of the eternal fitness of things preserved from outrage. At present he must needs go to the decayed Dutch towns by the Zuyder Zee for his supremest satisfaction, for even in such derelict places as the town of Sandwich modernity is seen and the pulse of life still beats, however feebly. At York the pulsations are steady and strong. Suburbs stretch to every point of the compass, and Roman Eboracum and the mediæval city of York form but a central speck. The Roman city is not evident to the casual glance, for the Middle Ages' walls of York overlie the

works of those sturdy colonists from Italy, and irreverent modern enterprise has destroyed much else, the fine railway station of York standing on the site of the Roman cemetery. But the city yet offers the finest exercise imaginable for the imaginative sojourner within her gates, for it is possible to make its complete circuit on the ancient walls, and to look down from the elevated battlements in a bird's eye view that gives a clear conspectus of ancient and modern alike.

There have been many unworthy buildings erected in York within our time—the products, possibly, of those who have been crushed by the ever-present domination of the overshadowing Minster. This fact brings us again to that nice point with which we started; and in truth it is but rarely that you will find thriving firms of architects in cities of this description. Inspiration lurks more generally in spots barren alike of scenic beauty and of historic buildings. Hence the rise of the Glasgow and Birmingham schools of artists and of decorative illustrators. At York,

ance. Yorkshire villages are, in fact, of the grimmest, and at the same time most uninteresting, kind. There is no excuse for this, for although the scenery is often harsh, wind-swept and barren it should in modern times beget what it did of old, a masculine style characteristic of the surroundings.

In talking with Mr. Brierley, whose work has lain, of course, chiefly in Yorkshire, one finds an ardent advocate of "local style," and his completed works do not belie his principles. Thus we find in his new church at Rufforth, that village set on the windy wolds, a note of stern, four-square strength, a sparing use of enrichment, that render the building at one with its surroundings; and in his design for a church at Goathland, and his Mallyon Spout Inn at the same village, one may seek with success a reflection of the conditions obtaining at that weather-beaten moorland spot.

The firm of Demaine and Brierley, of which Mr. Walter H. Brierley is now the sole representative, has had many incarnations. Taking its origin in John Carr, whose practice began

HOUSE AT FULFORD, YORK.

however, we find an exception to this rule. Messrs. Demaine and Brierley have long carried on their architectural practice, and have greatly helped to leaven the somewhat sordid lump of modern work in both York city and county. From their offices in Lendal, that quiet thoroughfare in the midst of the city, have proceeded plans and designs for halls on Yorkshire wolds and in Yorkshire dales, for villa residences, for banks, schools and churches, that have done a great deal towards redeeming the reputation of the provinces in matters of architectural taste, and have shown that we in London have not the monopoly of distinction in design. It is just this note of distinction, this rare quality of style, which Messrs. Demaine and Brierley have happily imported into the business of a varied country practice. There is plenty of room for it in Yorkshire, as those who have travelled that vast county well know, for by some accursed fate it has generally happened that within the circuit of the Ridings situations of the most delightful character have been bedevilled by houses of the most abject appear-

a hundred and fifty years ago, the business has a history which may best be shown in the following tabulated form:—

Name.		Began to practise	Retired or died
John Carr ..	The renowned "Carr of York"	about 1750	died 1807
Peter Atkinson, senior	Assistant and successor in part to last	" 1785	" 1805
Peter Atkinson, junior	Son and partner of last, and afterwards successor	" 1801	" 1842
Richard Hey Sharp	Partner with last as Atkinson and Sharp	from 1819	to 1828, when he retired
John Bownas Atkinson	Sons and partners of P. Atkinson, jun., and afterwards successors	1832	died 1875
William Atkinson		1837	retired 1878 died 1887
James Demaine	Partner with last under the title of Atkinson and Demaine, and afterwards successor	1870	retired 1899
Walter H. Brierley	Partner with last as Demaine and Brierley, and now successor	1885	—

Although the old style of the firm during the last partnership is retained, we are here concerned only with Mr. Brierley's personal handiwork. Prominent in this connection is his elaborate and careful restoration of Welburn Hall, a noted Yorkshire mansion built in 1609 and unoccupied for close upon a hundred years

HOUSE AT FULFORD, YORK.

before Mr. Brierley's clients spent £50,000 on its enlargement and restoration. The accompanying illustrations will convey an idea of how pleasing a task this must have been: the restoration and remodeling of so romantic a seat and the planning of the additions east and west of the original building—additions made necessary alike by increased accommodation for the family and by reason of the greater needs of modern households. The "View from the South-west" in particular among the illustrations of Welburn is interesting, for it shows at a glance the characteristics of the old work and the new, and the modern embellishments upon the original severity of the style which Mr. Brierley has permitted himself. To the right is the original building, high-shouldered, and, truth to tell, not a little grim of aspect, especially if we imagine the addition of the oriel away. This, then, is how they built in the first years of the seventeenth century—not without some suspicion of the semi-fortified mansions of earlier periods still lingering in the sheer walls and simple outlines of the old building. Very different are the tendencies of these times, as instanced in Mr. Brierley's new wing, seen stretching out to the left. Lines have a tendency toward the horizontal, rather than to the perpendicular; a cheerful domesticity, rather than a gaunt reserve, seems the dominant note, and the many and large windows argue that sense of security which, almost more than anything else, has changed the aspect of domestic work of late years. Our two plans show the interesting

WELBURN HALL, YORKSHIRE.

—is seen in the growing series of elementary and higher grade schools that he has designed and built in the last few years—those in and about the city at Scarcroft, Park Grove, Fishergate and Shipton Street—involving an

—demands which have not yet, unfortunately, been properly satisfied in London. This "central hall" system, with its class-rooms and offices grouped round, is bound to be a coming feature in Board School designing in general. One of Mr. Brierley's recent works is the Jubilee Children's Ward for the County Hospital at York, while to his domestic work must be added the new and imposing buildings of "North Cliff" Filey, overlooking the Yorkshire coast at that picturesque spot; addition to Burtonfields, Stamford Bridge; new wing at "The King's Manor," York; Nurses' Home and other additions at The Retreat, York.

Sufficient has already been said to show the variety of Mr. Brierley's practice, but we have as yet made no mention of the very numerous banking premises erected by him, chiefly for the York City and County Bank, comprising branch establishments at Doncaster, Rotherham, Horsforth, Bridlington, Bishop Auckland, and Whitby, together with two in progress at Selby and Shildon. They all partake of the same character, simple or elaborated, according to the relative importance of the towns in which they are situated. Stone built, with that air of dignity and reserve which seems to be an essential feature to banking business, they all have a strong Renaissance feeling, and are characterised by broad wall-spaces, judiciously left plain and free from the vicious modern practice of breaking up surfaces in needless and distracting alleged decoration. The design for the Selby branch in particular, shows this just sense of reserve, and will afford a new feature in the market-place of that little town, whose street architecture has hitherto had nothing to show the stranger. If

WELBURN HALL, YORKSHIRE.

disposition of the house and its garden, with the pretty feature of the loggia; and the illustrations of the great hall and the great drawing-room serve to indicate the scale upon which this interesting work was done.

Centred in a city like York, with a vigorously pulsing life of its own, the firm of Demaine and Brierley is responsible for a great deal of recent work within and without the encompassing walls. From the numerous modern residences in the suburbs built at an average cost of from £1,500 to £3,000 apiece we may turn to the more imposing residence at Fulford designed by Mr. Brierley, illustrated here in two views. It is a brick house, cast chiefly in the early eighteenth century convention. The two gables of generous width, breaking up what would otherwise be a somewhat severe formality in the front elevation, give a fine air of dignity to the mass. As Diocesan Surveyors the firm have acquired a widespread and intimate acquaintance with this great Yorkshire diocese, and, besides the building of some thirty parsonage houses and churches, as well as numerous restorations, have carried out the building, restoration, or enlargement of Welham Hall, Malton; Rawcliffe Hall, near Goole; Rufforth Hall, formerly a farm house; Hawbarrow, Heversham, for Canon Argles; and houses at Brompton, near Northallerton, and Easingwold. Another and important side to Mr. Brierley's activity—especially important from the public and educational points of view

outlay of £60,000. These are characterised by a feature first introduced into Board School planning by Mr. Brierley, viz., the arrangement of the "central hall," which makes at once for collective instruction and good administration and for thorough sanitation and athletic exercise

WELBURN HALL, YORKSHIRE.

banking companies and corporations in general are thus to be found embarking upon buildings of real architectural character, they will deserve our gratitude for leavening the dull and heavy lump of undistinguished buildings in our small towns. The Doncaster building for the York City and County Bank is naturally on a more elaborate scale than that of most of the others. It is a very real and welcome addition to the architectural amenities of that horse-racing town, which indeed is not greatly distinguished for the beauty or the imposing nature of its buildings. The Mansion House of Doncaster is perhaps the only other secular structure in Doncaster which would arrest the eye of the passing stranger; but that is a classic design of much beauty and strength, executed considerably over a century ago. Situated almost directly opposite the site for the new building of the York City and County Bank its commanding character naturally suggested to Mr. Brierley the advisability of designing something, if not exactly on the same lines, at least with the same feeling. Accordingly, here we have a double elevation in Portland stone, with a refined rusticated ground floor, and Corinthian pilasters of bold projection dividing the windows of the first floor and supporting a massive frieze and cornice. The interior of the banking premises is a very pleasing and original design, being vaulted instead of treated with the usual type of ceiling found in banks. The result is peculiarly dainty. Mr. Brierley is not one of those architects who try to obtain the credit for all the work which proceeds from their offices. On the contrary, he gladly recognises the part played by his assistants, and declares that such success as he has achieved is owing in no small degree to the exertions of an able and loyal staff.

EARLY CHRISTIAN CHURCHES IN IRELAND.

INISCLOTHRAN is a haunt for the antiquary and the architect; it was the island home of Queen Maeva in the fourth century and of St. Diarmid in the sixth century. From Athlone you take a steamer up the Shannon, passing through charming scenery, and it is not long before you reach the island of Inisclothran in Lough Rea, for it is only twelve miles by water from Athlone.

Limestone is easily procured, so that the

church builders had not far to go for their principal building materials. With one exception—that of the Tower Church—the buildings cluster together at the south end, forming a little colony of their own round the parent church of St. Diarmid. It would appear from the number of ruined and half-covered stone walls, which seem to run in every direction, that these buildings were enclosed, as well for the protection of cattle as for defences in the time of war. Teampull Diarmid was the first work of the saint when he selected this island as his home, and dates from the middle of the sixth century. Here we have one of the diminutive buildings of the early Christian Church still retaining in what is left of it some of the peculiar features of that remote, shadowy, but interesting period. The ends of the side walls project a foot and a half beyond the face of the gables, thus unintentionally forming buttresses, a faint foreshadowing of what ultimately became an important

and magnificent architectural conception. The measurement from one outer extreme to the other is only 14ft. Internally it measures 8ft. by 7ft., being thus one of the smallest churches in Ireland. It is duly orientated a few points north of east, thus showing that its foundation was laid in the first portion of the year. The doorway in the centre of the west end bears evidence of having been slightly disturbed, being 1in. wider at the lintel than in the centre of the ope, owing no doubt to an inward movement of the jambs. The remnant of the gable over this door rises to a height of 15ft. from the present ground line. The east window has disappeared. There appears to be no doubt that this church once possessed a stone roof, although no vestige of it now remains. In fact, the wonder is that any portion of it, walls or gable, has survived through the long roll of storm-swept centuries and the ruthless devastation of barbaric warfare.

Between the walls of this church and Teampull More stands a little stone with crosses carved on both sides of it. They are rudely cut on a natural slab, and are of very early date.

The church of Teampull More stands within 12ft. of Teampull Diarmid. In point of size and development this monastery is by far the most important ruin on the island. The church consists of a single nave 47ft. 7in. long by 21ft. 5in. wide, the masonry walls rising to about 13ft. and being in fairly good preservation.

The two graceful lancet windows in the east end are long, narrow, and well recessed, to all intents similar on the inside, but strangely unlike each other outside—one being severely plain and the other elaborately moulded. These windows are much later than the church, and their insertion has evidently been at the expense of what at one time must have been a beautiful double-chambered piscina, with an octagonal column dividing it in the centre—the base of which alone remains, crushed over as it was by the intrusion of the window jambs. Possibly this church, like more of its neighbours, had only one window to light it from the east. The windows on the south side have also the appearance of later additions and are unequal in every respect. All traces of doors have vanished, but the ope, which have been arched and protected by the Board of Works, seem to indicate the position of a west door and an entrance on the north side of the cloister.

The subsequent additions consist of a vaulted sacristy (sometimes called a penitential prison) and a chapter room, which form a range on the north side and were connected with a cloister. The outline of the three remaining cloisters is still traceable; the walks are only 35 ft. long

BANK AT DONCASTER. DEMAINÉ AND BRIERLEY, ARCHITECTS.

INTERIOR OF BANK AT DONCASTER.

Most of the arches opening to the garth are gone, but judging from the springers that are left they must have been rudely constructed. The door into the sacristy from the church seems to have disturbed a window on the north side, as some of the cut-stone still remains, and at one time the sacristy seems to have had a door into the cloister. This compartment is lighted by a very fine specimen of fifteenth-century single-light window, evidently an insertion of a later date. The south cloister appears to have had a shed or lean-to roof against the church—a very usual mode of covering such walks; but no trace is left to tell the story of the north and west cloisters—of their construction or what they led to. An upper chamber exists, and when perfect it covered the chapter house, sacristy,

"Chancel Church," and here we find the first foundation—or the early church forming the chancel of a more extended house—the nave being a subsequent addition. The entire dressings of the chancel arch are lost, and most of the window dressings have disappeared, but the east window is fairly perfect, and closely follows those of Clogas (Tower Church) and the Church of the Dead. These windows vary in width, seldom being more than 6in. wide at the exterior ope owing to an almost absolute impossibility of procuring glass. The construction of these windows shows the influence of the coming style on its predecessor—in the blending of the two. Underneath the window stand the remains of the ancient altar, rudely built of rubble stones, but minus the altar slab. To the east of the chancel wall is a rough heap

distance to the south of the churches which have been described, and consists of four walls ranging from about two to nine feet high, and entirely devoid of any worked detail.

There is no doubt that this is the most modern church on the island. It may have been the church for the women of the settlement, or for special purposes like the galilees of some of the great English cathedrals—a place where women were allowed to see their relatives who were monks. Near this church, half buried, with its face downwards, was found a stone bearing incised on its surface a Celtic interlaced cross, with an Irish inscription. This cross and the one already mentioned are quite equal to the best at Clonmacnoise, and clearly prove the antiquity and importance of Inisclonmacnoise as a religious establishment.

The Teampull Clogas, or the Tower Church, stands isolated and lonely, crowning the highest point of the island. It is remarkable for possessing a square tower at the west end, which gives the church its name. On plan this church is rectangular, being 34ft. 8in. by 16ft. 8in. The east window is Hiberno-Romanesque work, but primitively cut on the outside, being 3ft. 4in. high by 7in. wide, with the arch scooped out of a single stone. This is rather strange, as the interior work of the window is worked with advanced skill. The tower is square on plan, battered in the lower portions, and bonded into the old gable, to which it is added. It was entered on the ground floor from the inside of the church by a square and badly-formed doorway. The arrangement for entering the upper stages of the tower is peculiar in the extreme—a stone staircase leads to a landing, from which some gangway or staging of wood must have extended to the doorway, which entered the upper floor from the centre of the gable end. This stairway is built into the north wall of the church, with a window facing its two doors, and is clearly indicative of not very early work.

At one time—in the last century—a man named Fairbrother, who belonged to the Society of Friends, settled on this island, and from his occupation it became known as the "Quaker's Island." This good man had no love for the past, and regarded this church in particular as a sort of fairland quarry—one which yielded ready-made squared stones—and he used them lavishly to build his residence. The south side of the tower painfully reminds us of this, as it has been denuded from top to toe of its covering, and stands a melancholy monument to the Quaker's devastation. In the remains of his house can be seen many fine, old-worked stones built in as ordinary rubble work. Close to the east end of Clogas, in the corner of a field, a small circular fort or dwelling can be traced, and beside it some huge slabs like a tumbled cromlech, evidently the remains of Queen Maeva's royal residence.

To those who care to investigate the conditions of life which existed in remote times—in the dawn of Christianity—and its evolution as it advanced and prospered through the middle ages down to the Dissolution—these crumbling walls reveal many phases, and act as a veritable link between the past and the present. They seem like chapters through which the story of life has run, in which each special feature forms a picture, an illustration of "the strange, eventful history." Such a story, fragmentary though it be, cannot fail to be of great value as a tangible asset in the records of our country, and therefore worth preserving with far more care and attention than has hitherto been bestowed on it by the well-meant efforts of the Irish Board of Works.

Building Trades' Gift to the Nation.

Her Majesty the Queen has been graciously pleased to endow two beds, their Royal Highnesses the Duke and Duchess of York endow one bed for a soldier or sailor, Her Royal Highness Princess Christian of Schleswig-Holstein one bed for the King's Royal Rifles, and their Highnesses Princess Victoria of Schleswig-Holstein and Princess Aribert of Anhalt a bed for a "Greenjacket."

WELBURN HALL, YORKSHIRE. DEMAINÉ AND BRIERLEY, ARCHITECTS.

and east cloister, the internal walls of the lower apartments forming intermediate supports for the flooring. This chamber, possibly the community room, was spacious and well lighted, and at the north end had a beautifully-traceried window, which, on the inside, had an open back, well recessed, with a stone seat running round it, giving it an unusual air of comfort. This chamber appears to have been entered from the north-east end, possibly by a circular stone stairs rising from the ruined foundation, which still exists. The sacristy contains a number of cut-stone fragments, to which it is impossible to assign a place, but some of them are curiously worked, and all are interesting. It is worthy of note that the interior walls of the church were once plastered.

The next adjoining building is known as the

of broken masonry, conjectured to be a "saint's bed." A tree has forced its way into the north wall, and is slowly but surely working the total destruction of the masonry. Close beside and almost in line with the Chancel Church is the Church of the Dead. The building is a fairly good example of the type of early Christian churches in Ireland. The extreme dimensions are 23ft. 8in. by 15ft. 8in. The walls have crumbled away to only a few feet high, and have lost all distinctive features of detail except the east window, which is similar in most respects to that described above. The little that is left of this church will soon be lost unless the growth of the ivy is speedily checked.

The fifth of the churches forming this cluster is, Teampull Murry. This church—St. Mary's, as it is sometimes called—is situated a short

AMERICAN ARCHITECTURE: AS OPPOSED TO ARCHITECTURE IN AMERICA.*

By ERNEST FLAGG.

AT no time since the Europeans first began to build in America has there been anything which might properly be called an American style of architecture. There have been American ways of building, as, for instance, our high buildings with the skeleton construction, and the cast-iron fronts of thirty or forty years ago; but the decorative features have been used in accordance with passing fashions, supposedly modelled on European usage, with no such modification as would stamp them with what might be called an air of nationality; or else they have been extraordinary attempts by individuals at originality. None of these attempts have met with popular favour.

All the so-called "styles" of the past have been created by a slow system of evolution from what had gone before, accomplished by the combined effort of all the minds engaged, working along the same lines, each one contributing his infinitesimal share to the never-ending process, a process which is precisely similar to that which produces our fashions in dress. No one knows exactly who is responsible for the change, but we can see that change is always in progress; to the uninitiated it may not seem very apparent from year to year, but if we compare the fashions in dress at intervals of ten or fifteen years the change is striking enough for anyone to distinguish. So it is in architecture, though, owing to the nature of the materials used, change occurs more slowly. If we study the

History of Architecture in Europe, we shall find that, from the tenth century, all the great changes in style were simultaneously common to all the countries. Thus we find in practically all European countries at about the same epoch the styles which are classified in a general way as Romanesque, Gothic, Renaissance, Rococo, &c., but in each country or province, soon after their introduction, they assume a distinctive local character. We also find that some one country is in advance of the others, and that every great change spreads rapidly from the place where it was first developed to all the other countries, but that the minor changes do not spread rapidly, and are confined generally to the different localities where they originate, and go to make the local or national distinctions of the general style. It is natural that as communication becomes more rapid between different sections these local differences should disappear, and this is exactly what we find has happened. In France, for instance, during the Gothic epoch, we find distinct local characteristics in the different provinces; thus the Burgundian, Aquitanian, Touranian, those of the Isle de France, &c.; while to-day the style is national, or, we may say, Parisian.

Barriers.

Now, it seems not at all unlikely that the causes which have led to the breaking down of the barriers between the different provinces of one country will in future operate to break down the barriers between the different countries, that local characteristics will become less and less pronounced, and that even the minor changes in the fashion of building will tend to become more world-wide. This is exactly what has occurred in the fashions for dress. Local distinctions are rapidly passing away, and a dress that is fashionable to-day in Paris is also fashionable in New York, Berlin, Rome, St. Petersburg, London, and in every other civilised capital. If France leads in this respect, and the others follow, it must be because there is in the French mind a quality which fits it to lead in such matters, for the bondage of the other nations is entirely voluntary.

Owing to the peculiar situation of America

and to the natural independence and lack of reverence of the American mind, the course of architecture here has presented an anomaly in the development of style, and rules which apply elsewhere do not seem to apply here. Nevertheless it is very certain that the process of development which works everywhere else will in time be found working here; indeed, it becomes more evident daily that this process is already well under way. The foundation for any such development must necessarily begin with the schools. In every European country we find that before the young men begin to build they undergo a long process of training, either in schools or as apprentices, to fit them for the work. In the past we have thought such preparation unnecessary. Almost every young American as soon as he is able to draw a straight line has felt himself competent to undertake any work of architecture, and not only that, but he has found that most people have been ready to agree with him in this way of thinking. People having large sums to invest, if not willing to entrust them to him at the start, have been willing to do so after a few years, when he is supposed to have had the necessary experience. These methods still hold true in many places to-day. Physicians, engineers, lawyers, and other professional men must have been properly trained before being employed; not so with architects. Most employers, indeed, feel that they are very good architects themselves, and few have any distinct notion of what constitutes an architectural training. This is an entirely

Unnatural State of Affairs,

and nobody who understands the American mind can believe that it will last. Indeed, there is at the present time every indication that it will not last. Schools of architecture multiply on every side, young men flock abroad to seek architectural training, and the results of this movement are already beginning to be apparent in our architecture. Fortunately, this force is a unifying one. I say fortunately, though I doubt if it could be otherwise. The great majority of our students are thinking and working in the same style, though this can by no means be said of our practising architects. They are for the most part still borrowing from any epoch of antiquity, or designing in a style of their own invention as the fancy seizes them. They deprecate what they call the "Frenchifying" of American architecture, as if there were any such thing as American architecture in the hedge-podge which we see about us.

In the meantime the French influence is slowly but surely predominating. Our young men go to Paris and become convinced of the wisdom of the French methods. From the great masters of the French school, under whose influence they are brought, they imbibe such logical, reasonable, and convincing instruction that I do not believe it possible for a young man anxious to learn to come away unconvinced. The converts which these men make after their return among the young men who themselves are not able to go abroad are as ten to one.

A Revolution is in Full Progress

among us, and it is beginning just where it ought to begin; that is, with the students. Let no one mistake the introduction of what appears to be modern French architecture as only a passing fancy to go the way of the "Richardsonian Romanesque," "Queen Anne," and "Italian Renaissance." It is an entirely different affair. It means much more than appears on the surface. The French resemblance is only an incident; it may, indeed, soon fall and pass away, but the movement means that the principles which the French use are being introduced here, and these will last, because they are founded on good taste, guided by common-sense. Henceforth American architects are to be properly instructed before they enter upon their duties. American architecture is not to be Frenchified, unless France can dominate the fashions of the world in building by her taste and skill, as she has dominated them in dress. The movement means that our architects of the future will apply to the art in this country the same logical reasoning, and that they will have the

same careful preparation for the work that helps the Frenchman to lead the world in the Fine Arts. It also means that in the future the whole body of American architects are to work together along the same lines, to think in the same style. Thus we are about to enter upon a course which will make possible the evolution of a national style of our own, or perhaps enable us to set the fashion for the world.

Views and Reviews.

SEWAGE PURIFICATION.

One of the most difficult problems in connection with the drainage of large towns is that of providing an efficient method of sewage disposal. Until about thirty years ago the processes involved in the natural destruction or purification of effete organic matter were not definitely understood. From ordinary observation and experience it was evident that sewage properly distributed over the land in suitable quantities became rapidly broken up and resolved into simpler compounds suited for plant life. These changes were largely attributed to the oxidising action of the atmosphere, until Pasteur positively demonstrated that fermentation and putrefaction were directly due to the presence of immense multitudes of micro-organisms. The recognition of this vital principle has resulted in the introduction of various ingenious arrangements to ensure in some convenient manner the rapid purification of sewage by bacterial agency. Within the last few years great strides have been made towards this end, whilst new and interesting developments are being constantly brought forward.

The author of the book under notice is eminently qualified, from his long and varied experience, to write upon this subject, and he has produced an admirable *résumé* of modern ideas and methods relating to bacterial purification. The first portion of the volume deals with the chemical constituents of ordinary sewage and effluents, together with the procedure to be adopted in collecting samples for analysis. The various species and characteristics of sewage bacteria are then described in detail, including the preparation and inoculation of the nutrient media necessary for the examination of bacterial life.

In connection with the cultivation of bacteria for the destruction of organic matter in sewage the author discusses the important question as to the possibility of the survival of pathogenic or disease germs after passing sewage through bacterial tanks or filter beds. The results of the investigations of Laws, Andrews, Houston and others are mentioned here. From the numerous experiments which have been made it is reasonably inferred that a properly designed system of bacterial purification is unfavourable to the life and growth of pathogenic organisms, more especially if the filtrate is subjected to a considerable amount of aeration and nitrification.

A large amount of useful information is given respecting the construction of bacterial filters or contact beds, together with descriptions of different systems which have been introduced, such as the Scott-Moncrieff, Exeter septic tank, Dibdin or Sutton, Lowcock, Ducat, Whittaker-Bryant, Stoddart, Candy-Caink, &c. The sterilisation of sewage by heat, chemicals, and electricity is also brought under consideration. The concluding chapter refers chiefly to the agricultural value of bacterial effluents, and the direct relation of trade effluents as affecting the general efficiency of the bacterial process.

The book is clearly and concisely written, the illustrations are excellent, and we commend the work to all who are in any way interested in this subject.

"Sewage, and the Bacterial Purification of Sewage." By S. Rideal, D.Sc. London: R. Ingram, Pleydell House, Pleydell Street, Fleet Street, E.C. Price 14s.

New Aberdeen Hotel.—The new Huntly Hotel, which has been built from designs by Mr. R. Duncan, of Huntly, has a frontage to Castle Street and the Square, and has cost about £6,000.

* A paper read at the Second Annual Convention of the Architectural League of America, held at Chicago in June last.

Masters and Men.

The Norwich Bricklayers' strike still continues.

The Taunton Carpenters' and Bricklayers' Strike has been settled, after having lasted fifteen weeks, the men resuming work last Monday. They came out on a demand for a rise of a penny an hour, with a code of working rules, and now they have accepted the masters' terms of a halfpenny an hour rise to take place at once, and a further rise of a halfpenny an hour in the first week of June next. Considerable satisfaction has been felt at the settlement, as the building trade has been almost at a standstill since April 1st.

Strike at West Ham.—A strike occurred last week among the workmen in the employ of Messrs. Gregar and Sons, builders, who have the contract for the restoration of the West Ham Technical Institute and Library. The Corporation inserted a special clause in the contract that only union men were to be employed on the work. A carpenter was challenged to produce his ticket, and then admitted that he did not belong to the union. His discharge was demanded, but this was not acceded to, and about thirty of the carpenters refused to work with him, and left with their tools. They were very soon followed by the bricklayers and labourers, and all work came to a standstill.

Bristol Building Trade Wages.—During the past few months the master builders have been in constant negotiations with the men, who asked for an increase in wages of a halfpenny per hour, to come into operation on June 30th last, together with sundry modifications in the walking time rules. The whole of the branches of the building trade have now signed, together with the master builders, a set of revised rules mutually agreed upon, and these rules have been deposited at the office of the Builders' Association and will now be issued to all members. The plasterers do not receive an increase of wages at present, as they had a rise last year, when there was a little difference of opinion between the Builders' Association and that section of the trade, but satisfactory arrangements have been made with regard to the other claims.

Trade in May.—The Board of Trade states that employment in the building trades has continued to improve during May, and remains good in most branches. The percentage of unemployed union members among carpenters and plumbers at the end of May was 1.9, compared with 2.2 in April and 1.3 per cent. in May, 1899. In the furnishing trades employment has continued to improve, and remains good. The percentage of unemployed union members at the end of May was 1.0, compared with 1.3 in April and 0.9 per cent. in May of last year. Employment in the engineering and metal trades has remained good. The percentage of unemployed union members in this group of trades at the end of May was 2.3, compared with 2.4 in April and also in May, 1899. Forty-four fresh disputes occurred in the month, involving 15,931 workpeople, of whom 10,043 were directly and 5,888 indirectly affected. Of these disputes 25 occurred in the building trades and five in the metal, engineering and ship-building trades. Changes in the rates of wages of about 181,200 workpeople were reported during May, averaging an increase of 1s. 0½d. per head weekly.

A New Bowling Pavilion at Blairgowrie has been built at a cost of £250. Mr. J. A. R. Macdonald is the architect.

Palestine Exploration Fund.—The annual meeting of the general committee was held on Wednesday last in the museum of the fund, 38 Conduit Street, W. Sir Charles Wilson read the report, which explained that the principal researches throughout the year were the excavations within a four-mile radius embracing Tell es Sâfi, Tell Zakariya, Tell Judeideh and Tell Sandahannah, on the eastern border of the Philistine Plain. The finds include a villa dating from Roman times.

R.I.B.A. EXAMINATIONS.

PASS LIST.

THE following gentlemen have passed the midsummer examinations of the Royal Institute of British Architects:—

Preliminary.

David Alexander Adam (Newcastle-on-Tyne), Percy Tidswell Adams (Bournemouth), Ernest Gladstone Allen, Hubert Dennis Aubrey, Gervase Bailey, Christopher Bannister (Crowthorpe), Robert Gerald Barrow (Bideford), Tom Forest Beazley (South Shields), Leslie B. G. Benson (Yeovil), Arthur Gilbert Berry (Norwich), Richard H. P. Bevis (Southsea), Ellis Rawson Birks, Henry Blackadder (Broughty Ferry, N.B.), Fitzroy Frederick Boldero (Penkridge, Staffs.), William Edward Brooks, Baldwin Brown (Bradford), George Ronald Bryce (Glasgow), Albert Edward Bullock, Stephen Burgoine, Geoffrey Burton, Benjamin Harlow Butters (Brighton), William Wellesley James Calthrop (Chelmsford), Archibald Neil Campbell, Cyril Barnabas Chesshire, George Reginald O. Chorlton (Manchester), Henry Francis Clarke (North Shields), Charles Emmerson Clouting (Cambridge), William Henry Collin, Robert Tyers Cooke (Leicester), Joseph Berkeley Cubey (South Shields), Ernest Thomas Cunliffe (Blackburn), Thomas Lawrence Dale, Noel John Dawson (Ipswich), Sidney Reynier Day (Skipton), Charles Willing Denton, Alfred William Douglas (Matlock Bank), Harold J. T. Duncan, Harold Hicks Earnshaw (Manchester), John Joseph Eltringham (Durham), Harold Quentery Farmer (Stalybridge), Henry F. P. Ford, Douglas Alfred Forster, Edward Lawrence Gaunt (Ilkley), Frank Stanton Gildersleeve (Hastings), Charles John Goodwin, Reginald John Goulston, Robert Francis Graham, B.A. Cantab.; Leonard Bishopp Grant, Jordan Green (Birmingham), William Greenwood (Blackburn), Ronald Hamilton Greig, Sydney Robert Griffen (Plymouth), Arthur Bernard Harvey (Canterbury), Arthur Hugh Hasnip (Hastings), Walter William Hitchins (Plymouth), Douglas John Hobgen (Chichester), Arthur Rowland Holman, Percy Aspden Horrocks (Bolton, Lancs.), Walter Arnold Ingledew (Tynemouth), Thomas Frederick Ingram (Wakefield), Charles Henry Jackson, Hugh Parry Jones (Conway, N. Wales), Matthew M. C. Jones (Glasgow), John Norman Keadley, John Harold Kennard, Harold Kershaw (Worthing), William Alexander Kidd (Greenock), James Henry Lang (Dukinfield), William Henry Lomas (Burnley), Charles Ernest Lovell, Percy Wells Lovell, Percy Luker, John Bernard Lund (Chorley, Lancs.), William Mackintosh (Inverness), Herbert Pemberton MacNalty (Winchester), John Hatton Markham, Hugh J. C. Marshall, Charles Redford Morrison, Vibert Middleton (Newcastle-on-Tyne), Charles William Milburn (Newcastle-on-Tyne), Stanley Charles Miles (Bournemouth), Ewart Gladstone Millar, Christopher John Monson (Newark), Andrew Muir (Edinburgh), Ernest Ranson Mundle (Newcastle-on-Tyne), Harold Franklyn Murrell, Edward Robbins Nixey (Hartlepool), Robert Douglas Ogden (Manchester), Basil Oliver (Sudbury, Suffolk), George Wilfrid Page (Bolton), David Parkhill (Belfast), Claude Paterson (Bowdon, Cheshire), Basil Pendleton (Manchester), Leonard Pierpoint (Warrington), Montague Corry Pile (Newbury), Claud Vincent Ponder (Eastbourne), Albert Reginald Powys (Somerset), Harold Oswald Prestwick (Lancashire), Henry Melancthon Pritchard (Cardiff), Mowbray Procter (Hartlepool), Edgar Quiggin (Liverpool), Thomas Herdman Rae (Sunderland), Frederick Raine (Newcastle), L. A. G. L. Rawles, G. R. H. Reaney, Thomas Edgar Richards (Cardiff), Thomas Morgan Richards (Penarth), Frederick Gibbon Richer, William Ewart Roberts, Wilfrid Robson (Saltburn), William Herbert Rogers, Percy Havery Ross, Samuel Runcie (Glasgow), Tom Sadler Rushworth, Herbert Ryle (Newcastle), Hayward Lewis Samson, Henry Partridge Sanders (Cardiff), Victor George Santo (Bromsgrove), Lawrence poantlebury (Launceston), Jesse Francis chneider, T. T. G. Donaldson Selby, Christopher Long Sharp (Blackpool), James Hughan

Shearer (Exeter), Isaac Taylor Sifton, Harold Slater (Blackburn), H. R. G. S. Smallman, Neil Campbell Smith, E. T. L. Smith, Robert Ernest Stewardson, George Harrison Stone (Tuxford), H. S. Walcott Stone (Taunton), Charles Stonehouse (Blackburn), Percy Ripley Strong, John Towneley Sugden (Manchester), Harry Cecil Swindells (Manchester), John William Thorpe (Lytham), Maurice Tobias, Alfred Nicholson Tucker (Plymouth), Percy Turner (Bradford), James Irving Tweedie (Annan), James Henry Vaughan (Newport, Mon.), Louis Charles Veale, Francis Guilford Waddell-Dudley (St. Albans), Richard Arthur Waite (Bradford), H. H. J. Walder (Southampton), Marshall Eyre Walker, Samuel Wallis (Kettering), William Ernest Watson (Greenock), Harry West (Newbury), John Charles Whettam (Weymouth), Thomas William Whipp (Scarborough), Herbert Hodges Whittington, William Whymper (Framlingham), Arthur Gilbert Wood (Stoke-on-Trent), Henry Edward Woodsend (Nottingham), Alexander Lionel Woodward, Henry J. Wyeth, Reginald William Yates (Huddersfield), Henry Young (Bedford).

Intermediate.

(In order of merit):—Andrew Rolls, Clement Stretton (Leicester), Charles Thomas Palmer, Leonard William Ensor (Huddersfield), Sidney Hall Goodwin, Reginald Percy Chamberlain (Leicester), Norman Austin Leech, John Swarbrick (Manchester), John Brown (Northampton), Francis Robert Boyd Haward (Great Yarmouth), Leslie Patrick Abercrombie (Manchester), Edwin Osman Payne, Percival William Hawkins, James Miller (Sheffield), Frank Edward Stratton (Salisbury), John Norman Randall Vining, Arthur Tedman (Bristol), Wilfrid Stonehouse Payne, William Steel (Sunderland), Willie Hemingway (Bolton), Henry Makins Tait (Glasgow), Charles Frederick Ward (West Bromwich), Arthur Haynes Johnson (Winchester), Archibald Lawrence Holder, Geoffrey Goodwin Moorhouse (Liverpool), Guy Church, Sir Francis Charles Rupert Ford, Bart. (Ilkley, Yorks), George Lister Thornton Sharpe, George Herbert Jackson (Boscombe), James Morton Lethbridge, Basil Procter (Newcastle-on-Tyne), Fergusson Barclay (Weston-super-Mare), Henry Douglas Crewdson, William Herbert Hobday, John Parlett, George Maurice Roe (St. Leonard's-on-Sea), Godfrey D. B. Shepherd, William Peter Steel (Sidcup), Victor Wilkins, Arthur A. Williamson (Dundee), Robert Gordon Wilson, junior (Glasgow), Archibald Herbert Winterburn.

Final and Special.

Samuel Chesney (Stourbridge), George Edward Clay, Charles Heaton, Fitzgerald Comyn, Harold Cooper (Blackburn), Charles Archibald Daubney, William Ernest Emerson, James Ernest Franck, Arthur Reginald Groome (Manchester), Herbert Haines, Emanuel Vincent Harris, Frederick Milton Harvey (Gorleston), John Stanley Heath, Percy Erskine Nobbs, M.A., Sidney Vincent North, Cyril Wontner Smith, William Herbert Swann, Alexander Symon, Andrew Mitchell Torrance, junior, Robert Percival Sterling Twizell (Newcastle-on-Tyne), Charles Edward Vardell, Clyde Young.

New Workhouse Infirmary at Highgate.—The new Highgate Hill Infirmary, erected for the Islington Guardians at a cost of £273,000 (including the site), was formally opened last week. It stands in the grounds of the former smallpox hospital on Highgate Hill, and will accommodate about 800 patients. The various wards are 100ft. apart, but are connected together with corridors and open iron galleries for use in case of fire. While possessing no claim to architectural beauty, the designer having been rigidly bound down in the matter of expense, the building is excellently well laid out for the purpose to which it is to be devoted, and ample provision has been, or is being, made for the accommodation of the large staff of nurses, surgeons and attendants who will have to be lodged within reach of the patients. Mr. William Smith, of Chancery Lane, is the architect and the builders were Messrs. Kirk and Randall, of Woolwich.

COMPETITION FOR S. SERF'S CHURCH, EDINBURGH.

TOWARDS the close of last year the committee of management invited about ten architects to submit designs for the new building. Eight acceded to the request, and their designs have been on view at S. Cuthbert's Church Hall this week, being well displayed on screens in a good light, but the absence of competitors' reports is to be regretted.

The committee are to be commended on the manner in which the competition has been conducted. Mr. Macvicer Anderson, F.R.I.B.A., was appointed assessor, and his recommendations were adopted, as follows:—"Experientia," 1st; "Cruciform," 2nd; and "Crux," 3rd. The author of designs placed 1st and 2nd is Mr. George Watson, of Hope Street, Edinburgh, Messrs. Sidney Mitchell and Wilson, of Young Street, Edinburgh, taking third place.

On examining the designs one would unhesitatingly endorse the assessor's opinion as to the design placed first, it being unquestionably the best. The building is to consist of a nave 38ft. wide with north and south transepts, the chancel with semi-octagonal end being toward the east, with vestries, &c., on either side. The principal entrance is placed at the west end of the south wall, giving access to a wide lobby and leading also to the gallery stairs, the organ being in the tower, over the ladies' room.

The general appearance of the church externally is very pleasing; the treatment is bold, with just sufficient touches of detail to give it interest. A square tower with presumably a copper-coloured spire is placed at the corner of the two roads, and groups well with the building, though perhaps it would be improved if not of quite such sturdy proportions. The position of the session house, which is almost detached from the church, is hardly satisfactory, as it does not group well and will eventually block the view of the church hall to be erected afterwards.

The internal treatment, though interesting, is not so satisfactory, the barrel-vaulted timber roof over so wide a span and of comparatively short length having rather a bald appearance, and the chancel arch being too small in proportion to the nave does not improve the general effect.

On comparing the plans with the elevations one regrets to see the tower marks nothing more important than a ladies' retiring room and w.c. and the organ works. The method of arriving at the total of 800 seats for the area can hardly be regarded as satisfactory, as 54 of this number are placed behind the choir seats in the chancel, and the remainder are calculated at 2ft. 8in. back to back. Probably the area will not seat more than 700—if that.

As is frequently the case in competitions, the design placed first is incomparably superior to the remainder. One is not so ready to endorse the assessor's opinion as to the design placed second, also by Mr. Watson, which is of the cathedral type, the tower being placed at the crossing—a questionable arrangement for so small a church. The exterior treatment is bold, though the square tower with low-pitched roof is plain, almost coarse, and with lancet windows appears to be out of keeping with the remainder of the design. The plan, however, has its good points, the transepts having an unobstructed view of the pulpit, and only the seats for elders and choir are placed in the chancel. The session house occupies the same unsatisfactory position as in the first design, and the church seats only 2ft. 8in. back to back.

On the whole Mr. Watson is to be congratulated on his designs and for the artistic manner in which they are executed, both being illustrated by well-drawn exterior and interior views.

"Crux," placed third, also sends an artistically-prepared set of drawings. The plan shows a nave 31ft. wide with north and south aisles 11ft. wide. This appears to be the most satisfactory way of seating the congregation owing to the shortness of the site, and the spacing of the seats being 2ft. 9in. back to back is more satisfactory than the first and second designs. The chancel is placed at the west

with the entrances at the east towards the proposed side road, a square tower of lofty proportions marking the principal entrance. Externally the design is full of spirit and would look exceedingly well; the interior, too, is interesting, reminding one of the quaint Cornish churches.

Design D. is a good plan, with chancel at east end and morning chapel to one side. The design is not improved by the excrescence on the tower and the commonplace tracery to windows, and the drawings and perspective are poorly executed. "Wholly Red" submits a design consisting of nave, north and south aisles, chancel to the east, with session house and vestry on either side. The tower and spire mark the principal entrance to the west. The remaining designs by "Tyde What May," "15th Century," "Faldstool" and "Iona" are of little interest, and unsuitable for a modern church.

Bishop Jewel's Porch at Sunningwell, near Oxford.

OUR illustration shows the porch of the village church of Sunningwell, which, though actually situated in Berkshire, is within five miles of Oxford. It is particularly interesting, from more than one point of view. It was built by John Jewel (a celebrated divine and

its needs for many years to come—a couple of centuries, roughly speaking. The porch is, besides, a very picturesque structure, and worthy of preservation on every ground which can plead for a building—artistic, archaeological, or historic.

A brief examination of the porch is enough to show the damage it has suffered in the course of time. The wall, on two of its faces, is cracked right through the middle of the windows. The angles are bulged out; the arch of the door has spread, loosening the keystone, which is ready to drop out; while the door no longer fits the opening. The ceiling, moreover, is starred with cracks; and on the south side the wall of the porch has become altogether detached from the west wall of the church, by some four or five inches. The whole structure, in fact, is in imminent danger of collapse.

The cause of this dangerous state of affairs is twofold. It is to be found, firstly, in the nature of the soil on which it stands; and, secondly, in the heavy, modern, concrete roof which covers it. The whole church stands on soft earth, with no really solid foundation nearer the surface than six or seven feet. The northern angle of the west wall has subsided considerably, producing a deep fissure in the wall itself, near the west door and through the west window; and this movement has undoubtedly affected the porch itself. Then, again, the foundations of the porch are very

BISHOP JEWEL'S PORCH AT SUNNINGWELL, NEAR OXFORD.

controversialist, who in his later years became the official champion of Anglicanism) between the years 1550 and 1552, unless, indeed, Jewel had the porch built after his consecration as Bishop of Salisbury—that is, between 1560-1571. Its appearance, at any rate, with the mixture of Gothic and Tudor Renaissance detail, points to its erection during the period of Jewel's lifetime.

The porch stands at the west end of the church, covering the original west door, and it is in plan a heptagon—a figure very rare, if not unique, as the motive for the plan of a building. It is by no means improbable that a seven-sided form may have been given it for symbolical reasons; on the other hand, the shape may have had its origin in some question of practical convenience. The point is, in any case, one which can hardly be determined now. It derives additional interest from the fact that it was built at a time when church building, or structural addition to churches, had practically ceased to be undertaken. The Reformation found the Established Church in possession of buildings more than sufficient for

shallow, and do not spread out to any width; the walls, also, are built of small, irregular rubble, the mortar employed being of poor character. The fact of the foundation being poor, and unequal to the load upon it, has occasioned a considerable sinking, and helped to crack the walls.

The second factor is the heavy concrete slab with which the porch was ceiled in recent times. This slab, which is somewhat higher in the centre than at the sides, can hardly be less than six or eight inches thick, and must therefore weigh about three tons; besides, now that it has begun to crack, its shape must cause it to exert a great outward thrust on the walls. This is borne witness to by the fact that at some time or another it has been found necessary to put a kind of rim round the porch at the ceiling level, with an iron tie connecting the band from side to side. It is evident that in order to put this interesting building into a permanent state of repair the foundation must be made secure, and the ceiling removed.

To make the foundation secure, not only

should the porch itself be underpinned, and piers carried down to a solid foundation, but the north-west angle of the church should be underpinned at the same time. The concrete ceiling should also be removed, and replaced by a lighter one of wood. To do this a sum of at least £150 will be required. It is not, it may be added, intended to "restore" the porch in any way; all that is necessary is to make it secure against further decay.

The above particulars are taken from the report of the architect, Mr. Ambrose Poynter.

A small sum has been collected in the parish, which, however, is a very poor one, and it is hopeless to look for further help locally. In these circumstances the rector and churchwardens have issued an appeal, which has our hearty sympathy, in the hope that those living outside the parish may be induced to help in the preservation of a structure of more than local interest.

All contributions should be sent to the Rev. B. G. Collett Whittington, Sunningwell Rectory, Abingdon, Berks.

Engineering Notes.

A New Pier at Cromer has been constructed at a cost of £12,000.

Electric Trams at Southend-on-Sea are about to be introduced. Seven and a half miles of metals will be laid.

Electricity for Gloucester.—The Corporation electricity works at Gloucester, which have cost nearly £44,000, were formally opened by the civic authorities on Thursday.

Queenborough Pier was practically destroyed by fire last week. It was built to replace the structure destroyed by fire on May 19th, 1882, and cost about £100,000.

The New Central London Railway will not be opened till Monday, July 30th. The delay has been caused by the unforeseen duration of the decorators' work on the superstructure of the stations.

Institute of Sanitary Engineers.—At a meeting of the Election Committee held on July 11th Mr. C. B. Burnett (Sandhurst) and Mr. A. Timberlake (Kings Langley) were elected members, and Mr. W. J. D. Rudman (Bristol) was elected an associate.

The Electrical Standardising, Testing and Training Institution have made the following awards as a result of the recent scholarship examinations:—To Mr. F. E. Berry, Wellingborough School, Maxwell Scholarship, value 50 guineas, tenable for two years; to Mr. A. W. Scrooby, Dunheved College, a prize value 20 guineas.

Electricity in East London.—A Select Committee of the House of Lords have found proven a Bill to empower the authorities of Limehouse, St. George's-in-the-East, and Mile End Old Town to supply electricity in these districts, which will in due course become, with Whitechapel, the borough of Stepney. It was stated that the existing generating stations in Whitechapel will be able to supply at 1s. per unit cheaper, approximately, than the present company.

New Pier Pavilion for Bournemouth.—The Bournemouth Town Council decided last week to erect a pavilion at the shore end of the pier at a cost of £37,000. In addition to a central hall and galleries, which will hold large audiences, the scheme provides for a supply of shelters below, on the beach, with refreshment rooms. The chief ground of opposition was that the new building would probably result in the closing of the Winter Gardens.

High Speed Electric Railways.—Last Friday at a meeting of the Association of Municipal and County Engineers Sir W. H. Preece gave an address on the proposed electric railway between Manchester and Liverpool, which was rejected by a committee of the House of Commons this session. Sir William explained the details of the scheme, which was to run a service of trains on the mono-rail

principle between Liverpool and Manchester, a distance of 34 miles, at a speed of 110 miles an hour. There would be no risk in such a speed, and as a matter of fact some of the trains on the present English railways ran at times at a speed of 80 miles an hour. Anyone could travel in absolute comfort at a speed of 200 miles an hour, and the only risk would be that of a sudden stoppage. There were two reasons why electric traction was superior to steam traction, the first being that they could apply at once to the driving wheel the whole power at their disposal; and the second being that the application of power was continuous, whereas in a steam locomotive the application of power was variable. There were, of course, dangers in all railways, but in this railway they would be reduced to a minimum. There would be no risk of collision, for no train would leave Liverpool until the one before had passed Warrington. Then under the system derailing was practically impossible, and, further, there would be no junctions and no points. When the Bill was before the Parliamentary Committee the question of the power of braking the speed exercised the minds of the committee, and unfortunately at that time they had not sufficient knowledge from the experience gained to answer the questions put. They had since found out that with the Westinghouse air brake the train could be stopped within 900 yards; but in addition to that they had on the coaches two motors, each of which could be reversed, and the result would be that the motor would be converted into a dynamo—it would generate electricity itself and would act as a check and become an electric brake, and would without doubt stop a train going at 110 miles an hour at 500 yards.

Ludgate Hill Station.—The Court of Referees of the House of Commons had last week under consideration the Bill of the South-Eastern and Chatham and Dover Railway Companies, on an objection by the promoters to the Corporation of London being heard in opposition. Sir Prior Goldney (City Remembrancer), representing the City Corporation, said the Bill was to authorise the two amalgamated companies to make certain widenings of the London part of their system, three upon the South-Eastern Company's and three upon the Chatham Company's lines. The object of the widenings, which he admitted were well outside the City—at Charing Cross and Lambeth—was to make urgently needed improvements in the passenger accommodation for the persons living on the companies' system and travelling to and from London daily. Upon the companies' system and within the City was a purely passenger station—viz., Ludgate Hill—which had been the subject of a great deal of comment, anxiety, and complaint. The matter had on several occasions been brought to the notice of the Board of Trade, and, while not alleging distinct pledges by the company, he said correspondence had passed which led to the belief that the company intended to take action. The President of the Board of Trade, however, in reply to a question in the House, admitted that the companies had not carried out what was hoped at this station, on the ground of cost. The Corporation had been constantly approached, and they had therefore taken steps to oppose the Bill. He agreed that Ludgate Hill was not referred to in the Bill, nor was there reference in it to works or taking of lands in the City. The Bill provided for the bringing from suburban and outlying districts over these companies' lines into London generally a largely increased number of passengers, which must be deposited at, amongst other stations, Ludgate Hill, which confessedly was at present wholly inadequate for the people using it. The Corporation wished to provide that these widenings should not be completed until corresponding widenings and facilities had been made at stations within the City. They therefore sought power to oppose the preamble of the Bill in order to secure protective clauses.—The Court suggested that the objection was one which should have been raised on the second reading of the Bill, and ultimately, without calling on counsel for the Bill, refused to give the Corporation the right to be heard in opposition to it.

Correspondence.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.
BIRMINGHAM.

SIR,—I was very much pleased to find in your last week's issue a complaint about the inadequate salaries paid by architects to their assistants. It hardly seems right that an assistant after from five to eight years' hard work and expensive training should only receive about half the salary that a bricklayer or carpenter gets. I know an assistant who has been in the profession for eight years, and at the present time he receives the splendid sum of 25s. per week; for overtime he is granted tea money, which, if amounting to more than 8d., is followed by a lecture on extravagance. I sincerely trust that before long the Institute or some of the numerous architectural associations will take the matter up.—Yours truly,
HOPEFUL.

HOLBORN, W.C.

SIR,—I am glad to see someone has at last had the courage to broach this important subject, and am only surprised that it has apparently never occurred to anyone to do so before. "Disgusted" simply speaks the truth without exaggeration when he describes the hard lot which usually falls to an architect's assistant. In the majority of cases he who enters the architectural profession with no means of practising for himself when qualified learns to regret his action.

About twelve months ago I was seeking a situation and advertised as usual. One answer I received was most encouraging. The writer wanted to know amongst other things if I could prepare plans and details, and also if I could write shorthand and use a typewriter. For these services he would have given me the astonishing sum of £1 per week! Needless to say, I did not accept the offer.

If assistants would unite as "Disgusted" suggests something might be done towards curbing the rapacity of some members of the profession, but individual effort will not be of much use. However, things cannot go on for ever as they are at present, and I, for one, hail "Disgusted's" letter as a glimmering of the dawn of that day when architects' assistants' salaries will be commensurate with the qualifications required of them by their employers.—Yours faithfully,
NIL DESPERANDUM.

LONDON, N.

SIR,—I am much pleased to see that "Disgusted" has taken up the cudgels on behalf of "underpaid assistants." Perhaps you will permit me to say a few words, as I have had considerable experience amongst architects in town and country.

Let me say at once that the profession is in a far worse condition to-day than it was twenty years ago—so far as architects' assistants are concerned. At the time mentioned I was principally engaged in competition work, accepting engagements in various parts of the country. I had no great reason to complain, as I never accepted a salary below £3 3s. per week and travelling expenses, overtime paid at the rate of time and a half. But the frequent change enabled me to gain a large experience of architects and their ways. I have met some excellent "specimens" and at times some terribly bad ones. Did space permit "I could paint some interesting pictures." I have found architects who almost literally depended for their existence on the premiums paid by their pupils, paying some assistant a beggarly pittance of 30s. a week to look after them, teach them, and pose as "my manager." The pupils were put through the usual course of training in such cases—the five orders *ad lib.*, plain and coloured, enlarged and further enlarged, tracings of rejected designs, and copying drawings of buildings that existed only in the imagination. I have often met so-called architects who could not design a creditable building to save their lives, and who were absolutely dependent upon the ability of the assistant whom they employed, whose salary did not exceed £2 a week. These architects are the "black sheep" of the profession, but the quest on is,

how can we improve these things and better the position of the assistants generally? By combination. The assistants themselves must strike the blow. Let there be a central body having branches in every town throughout the country; let the subscription be moderate, and let all engagements be made through that one central body. Let all the members be classified and the lowest salary commence at 30s. per week. Let there be three classes, A, B and C, as follows:—

Class A should consist of members who are experienced and thoroughly qualified, who have a good knowledge of building construction, fair artistic ability, and are able to design, and who can be relied upon to manage during the absence of the principal. Salary, £3 3s. per week.

Class B should embrace those who have a fair knowledge of detail and construction generally, and are capable of making a set of drawings with a little supervision. Salary, £2 2s. per week.

Class C should take the juniors, who, having diligently completed their articles, should be capable of tracing neatly, have a fair general knowledge, can make themselves useful and prepare drawings from rough sketches. Salary, 30s. per week.

These are merely general ideas upon which to proceed, and of course further discussion will "sow the seed," and, let us fervently hope, produce a healthy crop.—Yours truly,

VIGILANS.

To the Editor of the BUILDERS' JOURNAL.

SIR,—As an architect's assistant, I read with interest the letter by "Disgusted." I think, with that gentleman, that it is time we did unite together, but I cannot help thinking that it is to a great extent our own fault that we receive such paltry remuneration. We have only to scan the advertisements that come out weekly in the several building papers under the heading of Assistants Requiring Situations, and there we can see partly the root of the great evil. Can we wonder that architects give such small salaries when, for a single advertisement, an architect was simply overwhelmed with applications for the vacancy, several gentlemen with experience varying from four to six years offering to engage themselves for the magnificent sum of 25s. per week. I am pleased to be able to say that their valuable services were not accepted. This is only one instance, but it will serve to illustrate what I mean.

I firmly believe that if the standard of salaries could be raised many smart and capable draughtsmen would be content to remain as assistants and not launch out for themselves, and so the tendency would be to improve the outlook both for the architects and their assistants.

I should be pleased to co-operate in a scheme for improvement upon the present system of assistants' salaries.—Yours, &c.,

HOPEFUL.

Strength of Beam.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am obliged to "J. E. J." (see p. 447 of last week's issue) for pointing out a slip in my working of the formula on p. 411 of your issue for July 4th. It is correct until almost the last line, where 202 lbs. per foot run is stated instead of per inch run. This will make the total safe load over 13ft. = 14 tons.—Yours faithfully,

HENRY ADAMS.

Lindfield Place.

To the Editor of the BUILDERS' JOURNAL.

WALKERN, HERTS.

SIR,—In the interesting account of the visit of the A. A. in your issue for last week it is stated that the large and beautiful screen which stands in the chapel was rejected from the parish church at its restoration. Now this so-called restoration was nothing less than a spoliation. In Mr. Lomer's account of it in Clarke's Local Directory for 1883 he says, on page 119, "Those repairs were carried on without the smallest regard to propriety or respect for antiquity. Some of the most beautiful fragments of fourteenth-century glass I ever

saw were removed from one of the south windows, and a brass-plate to the memory of Richard Chaloner, which I remember *in situ* on a stone on the floor, now lies before me, dated 1501. Beautiful wood carvings were also removed from the church. In short, there was a general spoliation of nearly all that was ancient, a Perpendicular altar tomb has been removed, and the brasses of a slab representing a man, woman, and their seven children taken away. There was at the same time discovered on the east wall of the south transept a painting about 12ft. high, representing SS. Michael and Margaret, a many-headed monster below their feet. S. Margaret appeared with long, flowing hair, and a crown with the nimbus, a small human figure kneeling at her feet to obtain intercession on behalf of the soul then weighing in the scales. The colours used were red, black, and ochre. S. Michael had wings composed of peacocks' feathers." An engraving may be seen in Vol. II., "Sussex Archaeological Collections." According to parish accounts the rood loft was taken down 1583-6. The hour glass was in the church in 1601.

The bells, five in number, date from 1573 to 1682. Some few years ago it was proposed to recast the tenor (1600) and to make it a heavier bell, at the expense of Mr. W. Sturdy, of Pax Hill Park. At that time, knowing Mr. Sturdy, I suggested to him to give an entirely new bell and preserve the old one, which was cast about the time his house was built (1599-1601). When next I saw him, he told me he had fallen into my views, which to his honour he at once carried out, and the old bell now does duty at the cemetery.

Now why cannot this old screen be again restored to the Parish Church?

Pugin, in his "Screens and Rood Lofts," amongst others mentions Burgh in Lincolnshire as possessing some fine work. On going there some years ago I found but little left—a Jacobean font cover and a pulpit. On asking where all the carved work was I was told, in Mr. —'s sawpit. Happily on the appointment of the present rector he recovered a considerable amount of it and placed it once more in the church. Again, the present Vicar of St. Giles's Church, Camberwell, hearing that some of his parishioners had several brasses belonging to the old church, obtained them without much trouble and placed them on the back of the present stalls in the chancel.—Yours, &c.,

S. B. CHITTENDEN.

Stripping Varnished Wallpaper.

To the Editor of THE BUILDERS' JOURNAL.

BALHAM, S.W.

SIR,—The reply given by your expert on page 428 of your issue for July 11th to an enquiry by "A.R.I.B.A." is a little unsatisfactory. If a contractor undertakes to "strip all wallpaper," the architect is legally justified in insisting upon the performance of the contract, although some of the paper referred to may be varnished and the plastering rather shaky withal. In this, therefore, your expert has rightly advised, for if the contractor is so careless as to sign an impracticable or undesirable undertaking without reservation he must not afterwards complain if he is required to carry it out.

But your expert states that he has never before heard of difficulties with plaster, and he does not answer "A.R.I.B.A.'s" question as to the custom of the trade in this matter. Sir, the plastering difficulty is one of the commonest troubles of the decorator's business, and whatever solvent is used the operation of stripping varnished paper will try the strength of the soundest lime plastering, and involve an enormous amount of stopping, making-good, and facing-up. A really practical architect would not require varnished paper to be stripped, nor would a cautious contractor consent to do it without a very ample addition to his estimate. The custom of the trade is not to strip varnished paper if and where sound, but any curled edges and loose parts should be stripped off, and the joints and stripped edges, if any, thoroughly glass-papered down, so that they may not show through the new paper. The commoner custom is to clear the surface, but where a better job is needed a brush over

with strong soda water will remove all dirt and bite into the surface of the old varnish, giving a key for the new paper. If the proposed new paper be thick, the wall should be lined with brown paper.

There are circumstances under which I should advise stripping varnished paper, but they are very exceptional, and when the caustic solution referred to is used it is almost impossible to keep it from damaging skirtings and other decorative work. I have in such cases successfully spread a thick caustic paste over the paper to be removed, which answers admirably and saves the surroundings; but even then there is still the damage to the plastering and the expense of facing-up.

It is common enough for architects and dilapidation surveyors to specify old varnished paper to be stripped, but the requirement is more often honoured by the breach than the performance, and where done it is nearly always a case of the architect unwisely insisting upon it. It is, of course, important for sanitary reasons to strip the ordinary absorbent paper, but these obligations scarcely obtain on good varnished work with the above treatment. There is, however, no reason why the surface should not be washed over with a disinfecting fluid to meet any scruples in that direction.

Yours faithfully, J. D.

Memorials of Greater London.

To the Editor of THE BUILDERS' JOURNAL.

ESSEX HOUSE, MILE END ROAD, E.

SIR,—You have been good enough from time to time to take note of the work of the Committee for the Survey of the Memorials of London. May I ask you to give publicity to the enclosed report (see p. 464) of its work, presented by Lord Monckswell at the recent meeting, at which Mr. Leonard Courtney presided. Will you permit me to invite on behalf of the Committee that assistance which a direct appeal through your columns makes possible?

In extending the work of the survey of the memorials of London from the East to the West-end, it is necessary for us to have the assistance not only of such as are the guardians of those amenities which we wish to see preserved but of all who are interested in doing this, of all those who would prefer to see the city they live in a beautiful rather than an ugly city—a city great for its history rather than its modernity.

The appeal we make is therefore not so much an antiquarian appeal as an appeal on the ground of good citizenship for help in the maintenance of the things that are beautiful and the things that have historic interest in the Greater London of our own time. Our work is to record these, with a view to making it easier to preserve them, and to this end we ask for help of two kinds:—(1) An increased honorary membership, a minimum payment of £1 ls. annually entitling to all the Committee's publications. (2) The active help of young architects, draughtsmen, painters and amateur photographers who would give their labour in lieu of subscription.

If any such would put themselves into communication with me I shall be happy to give them full particulars.—Yours obediently,

C. R. ASHBEE,

Chairman of the Committee.

The second of the new blocks of Admiralty Buildings is now finished. It has not yet been settled whereabouts the next outgrowth of the department is to take place. The fourth side of the quadrangle was at one time talked about as the site for the third new block, and it is still uncertain whether it may not be set up there instead of the low ornamental screen and covered way originally intended. But there is considerable opposition to thus shutting in and spoiling this square, which, with the dome surmounting the new edifice at the back of it, makes rather an effective show from the Horse Guards' Parade. To fill in this fourth side with another high building will materially affect the backs of the other three piles, and there is great reluctance to do it if it can be avoided.

MEMORIALS OF GREATER LONDON.

IN placing before the public the fourth report of the Committee for the Survey of the Memorials of Greater London some recapitulation of its objects may be of use as well as some statement of the work it has accomplished.

The object of the Committee has been to take up certain areas in London, and in them to register and record with drawings, photographs, and other records, whatever may be deemed to be of historic or æsthetic interest. The work is not confined to buildings only; any valuable open space, any remnant of an old village green, any beautiful tree, any object of local life or custom that may have a definite external embodiment, or any interesting piece of handicraft, even if it be but a signboard or a wrought iron gate, comes within the Committee's survey.

The aim is to draw attention to these things; if they are in private hands to get the owner's consent towards their registration; if under the guardianship of any representative public or semi-public authority, to encourage their maintenance, for public purposes, as national trusts.

The method upon which the work has been carried out has been simple. The area undertaken (about 30 parishes in the eastern side of London, together with the portions of Essex adjoining and included in the area of Greater London) has been divided up among the active members the Committee, and they either independently, or in conjunction with the secretary of the Committee, have filled up certain forms upon a definite classification.

A very large and beautiful collection of drawings, photographs, sketches, measured work, &c., has now been compiled by the members of the Committee, and is mounted and arranged in great albums according to the parishes of London. This portion of the work is similar to the famous Crace collection in the British Museum, and the Committee believes that when completed it will form a unique collection of what the Great London, at the close of the present century, still retained of historic interest or beauty. The Committee calculates that about 200 forms have been filled up, and about 2,000 drawings, photographs and sketches made. It has further to be added that in cases where a building within the survey has already been written about or illustrated, such as Waltham Abbey, Eastbury House, Barking, or Brooke House, Clapton, the Committee confines itself to giving a bibliographical survey, and noting its actual condition at the time of registration.

If, again, any piece of work appears to deserve special attention, such as the Trinity Hospital, in Mile End; the Church of St. Mary, Stratford-atte-Bow; Hill Hall, near Epping, the work of John of Padua; and the Great House, Leyton; the Committee seeks among its members to arrange for the preparation of a monograph upon the building in question. Two of these monographs have already appeared, and are in the hands of members of the Committee. They are supplied to all subscribers to the Committee's work of one guinea or more during the year of publication.

The most important portion of the Committee's historical, as distinct from what may be called its "watch" work, is the compilation of the register or survey of London buildings (see page 406 of issue for July 4th last).

It will be remembered that by the resolution of the London County Council in 1897 the Council recognised the work of this Committee as already in progress, and agreed to print such of its records, from time to time, as went to the making of the body of the register, provided those records could be brought within the administrative County of London, and provided the printed books were reserved only to subscribers and members of the Committee. After some delay it was arranged that the work should be done in parishes, beginning in the eastern districts of London, and taking up a western district as soon as possible. The original intention had been to take about six or eight parishes in a volume; closer examination, however, showed that the material the Committee had

already got together was so great, and it seemed so advisable to print *in extenso* a work that was to rank as monumental in the history of London, that it got narrowed down into the doing of one parish only, and one at a time, thus practically giving to each parish a separate volume.

The first of these volumes, dealing with the parish of Bromley, is now printed, and will be in the hands of members of the Committee shortly. The second, which is partly in type, deals with the parish of Bow.

The third volume of the register, it is hoped, will be an even more important one, and will deal with the parish of Chelsea. The Committee has already started forming its Chelsea collection, and a series of beautiful drawings of the houses on Cheyne Walk has been partly made. The completeness or full value of this volume of the register will much depend on the response made by residents in Chelsea to the appeal for permission to make notes and drawings of its many fine interiors, and otherwise assist the Committee to further the ends it has in view.

Westminster Abbey, Somerset House, St. Paul's, Waterloo Bridge—even the city churches—have many advocates, and there are many to defend them if they are injured. But not so the little things, the beautiful private houses of London, the noble pieces of old workmanship, the little pieces of local history that still exist in many parts, and that go to make up the interest or beauty of the great city. If every gentleman who inhabited a house that was built, say, before the year 1800, and took a pride in it, would have it photographed inside and out, its ceilings, its cornices, or any interesting thing in it, and would send plates to the secretary of the Committee, and would fill up the Committee's forms, it would add greatly to the completeness of the work to be done.

THE WESTMINSTER IMPROVEMENT.

SOME important evidence on the æsthetic aspect of the London County Council's Westminster improvement scheme was given at a meeting of the House of Lords Committee held last week to consider the Bill promoted by the Council for the purpose of carrying out various metropolitan improvements. Canon Duckworth, Sub-Dean of Westminster, said the Abbey garden, at the rear of the Abingdon Street houses, was the ancient garden of the infirmary of the Benedictine Abbey, and was the only open space which the Abbey body had for their use. The amenities of that garden would, in his opinion, be much injured if high buildings were erected in Abingdon Street. The Dean and Chapter had for the same reason opposed the previous syndicate scheme for dealing with this area. Very high houses on this site would detract from the beauty of the garden, and many of the best views of the Abbey would be destroyed. The Dean and Chapter considered themselves to be national trustees of the Abbey. He thought Abingdon Street ought to be continued in a straight line from Old Palace Yard, and not slanted towards the river as now proposed, which would entail the destruction of trees in the Victoria Tower Gardens some 20 years old.

Sir Alexander Binnie, chief engineer of the London County Council, said he had prepared the plans for the Westminster improvement. Under the scheme Millbank Street would be made 70ft. wide throughout and straightened out towards the river. The embankment wall would be extended to Lambeth Bridge, together with the Victoria Tower Gardens. The estimate for the work was £80,000, and for the land £235,000. At the Lambeth Bridge the new road would not end in a line with the Grosvenor Road, but with the foreshore; there was a scheme, however, in preparation for rebuilding Lambeth Bridge and its approaches, under which the Grosvenor Road would be widened to 60ft. by the taking in of the foreshore.

Mr. Young, F.S.I., valuer to the London County Council, in giving particulars of the property to be acquired by the Council for the carrying out of the works proposed, said the

cost of the acquisition of the property required for the whole of the Westminster improvement would be £1,189,000, with an addition of £50,000 for a portion of the site of Millbank Prison upon which to re-house the 1,854 people of the working classes who would be disposed of. The houses put up on the Abingdon Street site would be of the same height and character and architecture, so as to harmonise with the surroundings. In regard to the objections of the Abbey authorities, he thought it would be a great safeguard that any plan of rebuilding Abingdon Street would require the consent of the First Commissioner of Works and the County Council. Any postponement of the scheme would add to the cost of the property to be acquired. A committee of the Institute of British Architects was watching London improvements, and they were satisfied with the Westminster scheme, and when the question of rebuilding came no doubt the Council would do as they had done in the Strand case—submit the plans to the consideration of eminent architects.

Mr. T. G. Jackson, R.A., said he thought the line of the proposed street would destroy the surroundings of the Houses of Parliament and the Abbey. At present the line of Abingdon Street was parallel to the Houses of Parliament, and the street formed a fine approach from the south and had evidently been considered by Sir Charles Barry, who had placed St. Stephen's Porch of the Houses of Parliament to harmonise with it. The line of the proposed street would be awry with that of the Houses of Parliament, and would defeat Sir Charles Barry's intention, as the vista would miss St. Stephen's Porch and part of the Houses of Parliament. It was quite possible to keep the line of the Houses of Parliament in making the new street.

Mr. Alex. R. Stenning, F.R.I.B.A., M.S.I., agreed with what had been said by Mr. Jackson. The new approach should be worthy of the Houses of Parliament. He agreed that it would be better to keep the existing line of Abingdon Street and by means of a slight turn reach Lambeth Bridge. If that were done about one-and-a-quarter acres of land would be thrown into the gardens, but the low-level sewer would not need to be touched. The extra cost, he should say, would amount to about £50,000.

Mr. Freeman said the Council desired to make the improvement in the best possible way, and did not take up a rigid position in the matter. Mr. Stenning had estimated the additional cost at £50,000, and as the matter had widened by the introduction of æsthetic considerations the promoters would consider the matter. He asked that the Westminster improvement should stand over and the remainder of the Bill be taken. An estimate had been made of the increased cost of adopting the amended plan for the Westminster improvement, and it was found that it would entail an extra expenditure of £150,000, and there would also be an extra cost of £100,000 entailed in widening the Grosvenor Road. If the line of Abingdon Street were left and the improvement commenced at the end of the Victoria Tower Gardens and the road curved from there to the foreshore at Lambeth, the total extra cost would be £60,000, and only a minute fraction of the gardens would be touched.

Eventually the committee gave their decision as follows:—The committee find the preamble of the Bill is proved, but they are unanimously of opinion that the present Westminster scheme and that for the proposed approaches to the new Lambeth Bridge, together with the widening and necessary alterations to the Grosvenor Road, should have been presented to Parliament as one measure. The committee cannot approve of the proposed thoroughfare from Old Palace Yard to Lambeth Bridge as contained in the Bill, but are willing to agree to an alternative plan suggested, that the improvement should start with a straight road from the Houses of Parliament to the end of the Victoria Tower Gardens, and from thence by a curve to join the proposed widened Grosvenor Road, so as not to take any appreciable part of the Tower Gardens.

The clauses were postponed to allow amended plans to be prepared.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Book on Bank Fittings.

HAMPSTEAD, N.W.—HAMPSTEAD writes: "Could you inform me whether there are any books published on banks and their fittings? Also, the names and addresses of any firms supplying bank fittings?"

No book has been published on bank fittings. We would recommend your correspondent to write to Mr. Fawkes, Anchor Works, Chelmsford, and to Messrs. Lascelles and Co., Bunhill Row, E.C.

Cost of Building Lunatic Asylums.

WOKINGHAM, BERKS.—CUBE writes: "Can you inform me the average price per foot cube (net cubical capacity) of large modern lunatic asylums? Would 9d. or 10d. be the correct price for South Wales? I take 'net cubical capacity' to mean cubed from measurements taken internally, i.e., measurement of breathing space; and the term net is used thus in comparison to the usual method of cubing, including walls, &c."

Lunatic asylums cost from £120 to £160 per inmate, or about 9d. per cube foot on the ordinary method of cubing. If breathing space is intended by net cube measurements the price might rise to 10½d. per foot cube.

HENRY ADAMS.

Bandstand Roofs.

ULVERSTON.—FURNESS writes: "Which is the best form of ceiling for a bandstand in the open air? Should it be flat or otherwise, not taking into account the form or shape of the roof itself?"

All the bandstands we have ever seen have had flat, hollow ceilings acting as a sounding board. But if our correspondent will refer to the particulars of new patents this week on this page he will find a few particulars of a bandstand with a ceiling and floor of parabolic section.

Architects' Remuneration.

HALIFAX.—FAIRATION writes: "When the terms are arranged on the basis of a percentage on the outlay, is not the architect entitled to reckon his commission upon the total cost of the works, valued as if executed by a builder, and of new materials, as per the schedule for 'Professional Practice and Charges of Architects' published under the sanction of the Royal Institute of British Architects. The legal adviser to my clients says that the value of old materials re-used arising from the taking down of buildings required to be cleared off the site, to give place for new work, must not be reckoned, being of no cost to the clients, and if the whole works had been carried out in this way would not be chargeable for commission by architect, and he ignores the other clauses in above 'professional charges' as to measuring off work and getting out builders' accounts, and other items stated as chargeable, by advising the clients that they are not liable for any so-called extra services rendered in carrying out the work or caused by stopping contractor or the bankruptcy of same, &c., although not anticipated in arranging terms by either architect or clients. As the terms state in this case that the commission is to be chargeable upon the outlay, and the legal adviser states that as the old materials were of no cost to the clients they must not be reckoned or added to cost of work for commission purposes. H. P. B. in his reply evidently does not see the point raised in the way I should like, as he says old materials should be taken into account at the price of old materials in calculating the commission

due to architects. This to me is not fair at all, seeing there is more trouble involved in getting measurements and particulars of old work, and specifying where the same is to be used. It is also contrary to Clause 5 in schedule of 'Professional Practice and Charges of Architects,' and comes hard upon the architect where the whole erection is carried out in old materials, as in the taking down of old work and rebuilding same on adjoining site."

We adhere to the answer already given to "Fairation" in our issue for July 11th, if we understand his question. It is quite possible, however, that we do not. The note which he has appended to his original query increases the confusion. It would seem from it that the old materials or some of them consist of work not taken down at all, but allowed to remain so as to form part of the completed building. This would introduce an entirely new factor into the problem. The extract sent from "The Schedule for Professional Practice and Charges of Architects" does not touch the question, because, as has been frequently held, the scale charges do not bind the client unless there has been a special agreement with him that they shall do so. In the present case the one fact that seems clear is that the terms were arranged on the basis of a percentage on the outlay, and the only question is what was the outlay. We think it was what the new materials cost plus what the old materials used were worth, plus the cost of the labour. What the relevancy of the allusion to the bankruptcy of the builder is, we fail to see.

H. P. B.

Sanitary Institute Examination.

SANITARIAN writes: "Would you be good enough to give me a list of books required to pass the examination for membership of the Sanitary Institute and the prices of same. Is this the best examination dealing with practical sanitary science?"

The Sanitary Institute examination is one of the best of this description. Full particulars may be obtained from the Secretary, Sanitary Institute, Margaret Street, London, W. The following books are recommended: Moore's "Sanitary Engineering" (Batsford), 30s.; Reid's "Practical Sanitation" (Griffin and Co.), 6s.; and Knight's "Annotated Model Bye-laws," 12s. 6d.

T. E. C.

New Patents.

These patents are open to opposition until August 27th.

1899.—Sewage Purification.—10,386, W. M. DUCAT, 13 Devonshire Terrace, Hyde Park, London, W. The filter bed is covered with a double roof so as to conserve the natural heat of the sewage and that given off during the process of purification, thus guarding against the retardation or delay of bacterial action, particularly in cold weather.

Lead Glazes.—13,163, J. NOAD, High Street, East Ham, and T. H. L. BAKE, 20 Gayton Road, Harrow. The object of this invention is to reduce the risk of potters and others contracting plumbism when applying lead glazes. Instead of white or other lead compounds one of fritted lead is used. It consists of refined metallic lead, sulphur and silica fritted together, ground, washed and dried.

Sawing Machines.—13,470. G., A. R., W. R., and J. BULLIVANT, all of Moston Lane, Harpurhey, near Manchester. The usual way to "haunch" parts of doors is to use a single saw, make two parallel cuts, and then cut out the intervening part with a hand chisel. By this invention all this is done at once; a set of circular saws are mounted on a shaft obliquely, so that they have a "wobbling" action and cut a slot in the wood.

Pulley Stiles.—13,472 (Patentees, same as preceding invention). Instead of mortising the pulley stile of a sash frame a slot is cut from the top edge and a plain sash-cord pulley is fitted in on a pin, without the usual plate and fittings.

Rainwater Pipe Caps.—15,690. C. WILLIS and A. BATES, 1 Bond Street, Halifax. These are usually made of wire; according to this invention they are spun out of sheet metal in a lathe or stamped in a mould.

Purifying Sewage.—15,765. C. J. WHITTAKER, Willow House, Blackburn Road, Accrington. The sludge is used to inoculate the crude sewage, supplying it with the necessary micro-organisms. "Sludge" includes the sludge liquor and the scum.

Bandstands.—17,814. H. H. SPITTAL, 93 John Street, Glasgow. The roof and the floor of the bandstand are curved parabolically, so that the sound is directed outwards with more force and volume. The musicians are supported on a kind of false bottom.

The following specifications were published on Saturday last, and are open to opposition until September 4th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—10,832, BALMER, shoring and strutting. 13,348, HERCHENBACH, discharge valve. 13,895, PAYART, portable huts or houses, for military, colonial or other purposes. 13,904, LETHEREN, mortice locks. 14,201, DUDMAN, paving material. 15,989, HOPE, dredging or excavating apparatus. 16,501, ZIENTARSKI, process for the production of artificial stone, cement or plaster from sand, lime and other materials. 16,628, ANDREWS, arc lamps. 17,096, MORGAN, fixing handles to picks, mattocks, and other tools. 17,320, BROWN, portable tables. 17,402, BISHOP AND BURN, measuring tap or device for drawing off given quantities of liquid from vessels. 17,853, THOMPSON (Firm of *Terranova Industrie C. A. Kapferer and Schleuning*), manufacture of cement. 18,623, WAINWRIGHT, manufacture of tubes.

1900.—1,631, HULETT, handling and unloading apparatus. 2,631, HERVIEU, apparatus for generating acetylene. 3,812, CARMAN, rotary kilns. 4,993, ADAMS, water-closet apparatus. 5,572, O'BRIEN (*Wagner*), acetylene lamps. 5,728, ALLEN AND GARY, book-cases, drawers, &c. 6,038, RATHENAU, manufacture of calcium carbide. 6,073, BURGESS, connection for flushing pipes. 6,216, NOPPEL AND NOPPEL, compressing and exhausting pumps suitable for clearing and testing drains. 7,205, CROWE, raising and lowering grates. 7,591, LENG, machine for finishing glass articles. 7,612, KACHELMANN, suction and forcing pumps. 7,613, PETERSEN, locks. 7,695, GRACIE, machines for turning and facing sludge doors. 8,080, LUNDIN, steel castings and their manufacture. 8,081, LUNDIN, steel castings and their manufacture. 8,953, MCCONNELL, pipe and similar non-conducting coverings. 9,218, IMRAY (Firm of *A. F. Smulders*), apparatus for dredging and discharging dredgings from barges. 9,360, SINKOVIC, bob levels. 9,535, THOM, combined spirit level and straight-edge. 9,574, STOCKFISCH, construction of beams or girders of angle, tee, channel or other cross section. 9,646, PITT, gate-operating mechanism. 9,742, LAKE (*Bahls*), devices for locking the nuts of screw fastenings.

A Story of Tinworth.—It is stated that on one occasion a clergyman visiting the studio of George Tinworth, the sculptor, observed a terra-cotta and Doulton ware pulpit—now in Washington—decorated, of course, with panels of scriptural subjects. On the pulpit door Tinworth had put a bird's nest to proclaim "Foxes have holes, and birds of the air have nests, but the Son of Man hath not where to lay His head." "That, you know," he explained to the cleric, "is for the bishops and canons to see when they go up into the pulpit dressed in their fine robes." Ten years afterwards, Tinworth was rather taken aback by the same clergyman turning up at the studio to remind him of the incident, for the clergyman was Dr. Benson, who had in the interval become the Archbishop of Canterbury!

Bricks and Mortar.

APHORISM FOR THE WEEK.

"To the solid ground

*Of nature trusts the mind that builds for aye,
Convinced that there, there only, she can lay
Secure foundations."*—WORDSWORTH

Our Inset Sheets.

THE church of St. Mary Magdalene, Addiscombe, was commenced some years ago by the late Mr. E. B. Lamb, F.R.I.B.A., but was left incomplete at his death, in consequence of some difficulties of an ecclesiastical nature between the minister and his Bishop. Later, the present vicar, the Rev. H. Glover, raised funds for its purchase, and a large amount of money has since been expended upon its completion and internal decoration. The view, taken from the West, shows the church as completed (when it will accommodate over one thousand worshippers), with the proposed extension of the nave and aisles and the addition of an entirely new west end, with a fine west window, a south porch, &c. At the east end, next the chancel, which faces the road, a lofty tower is proposed to be erected, beneath which is the principal entrance to the church. This entrance has lately been completed, including a portion of the tower. The chancel inside has an arcade of polished granite columns and arches above, which gives depth to the traceried windows. The stone pulpit and desk have been enhanced by the addition of some rich traceried panels; and a new Credence table with elaborate canopy has been erected. The new work has been designed and carried out by Mr. E. Beckett Lamb, of Craven Street, Charing Cross, son of the original architect.—Mr. T. Raffles Davison's drawings of Welburn Hall are in illustration of the article on the work of Messrs. Demaine and Brierley, architects, on page 455 of this number.—Seacroft has lately been erected at Milford-on-Sea, near Lympington, Hants. It is on the cliff, and has a fine view over the Isle of Wight, Christchurch, and the open sea. It is close to the New Forest, and is built for occupation during portions of the year as a sort of bungalow. Especial care has been taken to make it weatherproof under exceptional circumstances, hence the treatment of rough-cast on solid walls. The house has been built for the architect, Mr. W. Ravenscroft, of Reading, by Messrs. Collier and Catley, of the same town.

Death of Mr. Martin, of Birmingham.

WE regret to hear of the death of Mr. William Martin, the well-known architect and surveyor of Birmingham, which occurred on Wednesday last at his residence, Lyndhurst, Erdington, in his 72nd year. During his apprenticeship Mr. Martin studied at the Birmingham School of Design, and afterwards became the managing clerk in the office of Mr. D. R. Hill. The connection with Mr. Hill was a very fortunate circumstance for the young architect, since it enabled him to study a branch of the profession which had been specially cultivated by his partner—namely, the designing of gaols and asylums. Mr. Martin showed great aptitude for the work, and the firm of Hill and Martin obtained a great reputation in this particular line. Mr. Martin was interested in the erection of the gaols at Swansea, Cardiff, Worcester, Warwick, Guernsey, St. Albans, Mold, Kirkdale (Liverpool), the county gaols of Surrey, Flint, Carmarthen, Cardigan and Merioneth. He also designed the Wandsworth Prison and the Swansea House of Correction, Weston Reformatory, and the additions to Saltley Reformatory. Mr. Martin's second partnership commenced in 1864, with the late Mr. John Henry Chamberlain, and was continued until the latter's death. Not the least noteworthy of the contributions of Messrs. Martin and Chamberlain to Birmingham architecture is to be found in the Board schools. On the death of Mr. Chamberlain, the

firm was carried on by Mr. Martin himself, and subsequently with the assistance of two of his sons, the title of the firm being changed only last year to that of Martin and Martin. Of their later work mention may be made of the preparation of the designs for the new lunatic asylum at Hollymoor, which were adopted after a competition; also of the erection from their plans of the new telephone exchange. Mr. Martin was also the architect of the reconstruction of the Grand Hotel. He married the daughter of the late Mr. Brown, of Shenstone, and of his family five sons are now living.

Vandalism at Byland Abbey.

MR. W. A. RUSSELL, of Bradford, writes to the "Times" as follows:—"I desire to call public attention to an act of vandalism. Quarrying in the ruins of our abbeys is not, as might have been supposed, a thing of the past. On Monday I visited Byland Abbey, near Coxwold, in the North Riding of Yorkshire (once the home of Tristram Shandy). Byland, which is the largest original Cistercian house in England, is in a very neglected condition; the outside walls, which show some beautiful features of design, are still standing, but the interior is filled with mounds of ruins. These mounds have quite recently been opened, but not for purposes of research. A mason's shed has been erected against the wall of the north transept for the 'dressing' of the stones, which—if any other testimony than the mason's shed were necessary—are, on the authority of the nearest neighbour to the abbey, to be used for building purposes. The excavations have disclosed beautiful and very complete sections of shafts, as well as carved capitals and pillar bases, &c. The idea of these being reduced from beautiful examples of Early English carving to mere square blocks of building stone is too dreadful to contemplate, and it is to be hoped that all societies and others who take an interest in the preservation of our ancient buildings will raise an emphatic protest against this spoliation of a fine old ruin."

New Market Hall for Leeds.

THE question of the erection of a new market hall, to take the place of the present covered market in Kirkgate and Vicar Lane, Leeds, was under the consideration of the Markets Committee of the Corporation last week. It may be recollected that plans of the proposed structure were prepared by Messrs. Leeming and Leeming, architects, of London and Halifax, the cost of which was estimated at £80,000. The matter came before the City Council in January last, and the scheme was approved, but it was decided that no action should be taken with the building at that time, the chairman of the Markets Committee and the chairman of the Finance Committee (the Lord Mayor) being requested to confer together as to the most suitable time for borrowing money, having regard to the rate of interest which would have to be paid. At last week's meeting, the Markets Committee resolved to communicate with the architects with the view of taking the necessary steps to obtain tenders. The new building will contain both shops and stalls. The frontage to Vicar Lane will be put back so as to bring it into line with the improvement carried out in that thoroughfare, from which, as well as from the other streets, the façade will have a very imposing appearance.

An Old Bit of Whitehall.

THE historic landmarks of Whitehall are being gradually "improved" out of existence; for instance, Sir John Vanbrugh's "pill-box" residence in Horse Guards Avenue, the "Olde Red Lion," and the whole of King Street. But it is not quite certain that the old tilt yard at the back of the Horse Guards Parade will be demolished. What is far more likely is that it will be utilised by the War Office for the accommodation of some branch of the establishment, in all probability that relating to fortifications. The tilt yard, which was the delight of Queen Elizabeth, stood somewhat to the south of Horse Guards Yard, adjoining the

north gate of King Street. It was here that, according to Sydney's State Papers, good Queen Bess "commanded the bears, the bull, and the ape to be baited," and on the following day some "solemn dancing." The Tilt Yard Coffee House, which was a famous resort of military officers, stood upon the site of the present office of the Paymaster-General.

A. A. School of Design.

THE designs made by students of the Architectural Association which have been exhibited at the rooms in Marlborough Street are highly commendable, and are a proof of the excellent work which the Association is doing, a work that will have a wide bearing. The school holds monthly meetings under the direction of a visitor, and it speaks well for the tuition that the Committee of Visitors includes the most prominent and capable architects of the day. A stone doorway was the subject set for the elementary class, and the large number of drawings exhibited showed a very fair average merit. The design for a billiard room given in the advanced class proved to be very popular, though there was nothing worthy of special praise. There were better designs shown for a garden house in a nobleman's park; those by Mr. Munro Cautley, Mr. E. B. S. Shepherd and Mr. W. Milner were very good. Mr. Edwin Forbes's design for a forecourt to a town mansion deserves mention, though the gate itself is not pleasing. Other designs were shown of a cottage hospital and an entrance cloister. Taking it as a whole, the exhibition was most satisfactory.

Ayr Town Hall.

THE question of rebuilding the town hall at Ayr was recently discussed by a committee consisting of fourteen councillors. The matter was under discussion for two hours, when the following motion was agreed to:—"That we ask for competitive plans to provide the necessary accommodation required for police purposes, on the ground floor if possible, and to provide a hall capable of accommodating 800 or 1,000 persons, the remaining space to be utilised for rooms *en suite* with the present Municipal Chambers. Any plans the cost of which will exceed £8,000 may be excluded." The amendment provided for the police accommodation being on the ground floor, for the sanitary inspector's and burgh surveyor's offices being on the first floor, and that the remaining space be used for providing a hall *en suite* with the Council Chambers to hold 600 to 900, the scheme not to cost more than £8,000.

Royal Architectural Museum.

THE annual general meeting of the Royal Architectural Museum and Westminster School of Art was held at the museum in Tufton Street, Westminster, last Friday, Mr. Aston Webb, A.R.A., presiding. Mr. Maurice B. Adams, hon. secretary, moved the adoption of the report, which stated that the Westminster School of Art continued to justify its high reputation as one of the most important schools of art in the kingdom. In the examination held in 1899 64 students of the school sat for examination, with the result that 14 per cent. attained the highest award ("excellent"), against 7.4 per cent. for the whole of the United Kingdom, and only 1.4 per cent. failed, against 27.4 per cent. Two of the students were bracketed third amongst the 1,527 candidates who sat for drawing from the life, and were awarded Queen's prizes. In the National competition, in which all schools of art took part, medals and prizes were awarded to the following Westminster students:—William Batchelor, John Bart Higgin, Henry James Strutt, Edgar G. Peman, and Isabel M. Smith. The subscriptions for the past year only amounted to £69 10s., and it would be quite impossible for them to keep the institution open if it were not for the School of Art, which brought in over £1,000 a year in the way of fees. The institution's impecunious condition was now a thing of the past. He urged that art students should turn their attention to applied art, in

which they would stand a far better chance of success than as mediocre painters. Mr. W. H. Seth-Smith seconded the motion, and subsequent speakers deplored the cloud under which Gothic art was at present. Mr. Emerson suggesting that the study of both Gothic and classic art would lead to the evolution of a system of architecture suited to the requirements of the new century. The report was adopted. The Chairman nominated Mr. W. Emerson, president of the Royal Institute of British Architects, as president of the institution in place of the late Duke of Westminster. Mr. J. H. Pollen seconded the motion, which was unanimously agreed to.

The Housing Bill.

THE Housing of the Working Classes Act (1890) Amendment Bill was read a second time in the House of Lords last Friday. Earl Carrington, supported the Bill, but thought it a disappointing one. The Housing of the Working Classes Act of 1890 consolidated and amended foregoing Acts on the subject and simplified and cheapened the machinery involved in municipal action. In 1889 the London County Council came into existence. Its predecessor, the Metropolitan Board of Works, used to clear areas and sell land to building companies, and housed 27,000 persons up to 1889. The London County Council began to build themselves in 1892, and in eight years housed 10,000 persons. What the Council had in hand now and had completed in the last sixteen months amounted to accommodation for 25,000 people, at a cost of £1,500,000, and they confidently expected that schemes they were now considering would enable them to house an additional 24,500, making a grand total of 60,000 within the next five years. They could have done better. What was wanted for urban districts was:—

(1) The period within which loans for building purposes must be repaid should be extended to 100 years. (2) Compulsory registration of the real owners of all property should be provided for, so that those benefiting from insanitary slums and illegal overcrowdings could be immediately and drastically dealt with. The Land Transfer Act of 1897 was not compulsory except in a few parts of London. (3) Power to the local authority to have destroyed, without compensation, and at the cost of the owner, insanitary slums injurious to health, where the owners failed to make them really habitable, after being called upon to do so. If then the owner refused to rebuild, the local body to have the power to do so upon equitable terms. (4) Power to local authorities to insist upon a much better transit service to and from the suburbs of the great towns. At present cheap transit followed the peopling of a new district. If overcrowding was to be really prevented cheap transit must be used largely for the development of a new district, and must not be left merely to follow its development. (5) The local governing bodies in our great towns should be empowered to acquire land compulsorily outside their own jurisdiction for the erection of workmen's dwellings. The Bill before the House gave this last concession, but refused to entertain the other points which were considered so essential to the welfare of the community at large.

North Lew's Preaching Cross.

LAST Friday being the Feast of St. Margaret, the Bishop of Bristol unveiled and blessed the venerable preaching cross in the market-place at North Lew—a village situated upon the northern fringe of Dartmoor. The cross, having fallen into a lamentable state of decay, has just been restored by Messrs. Harry Hems and Sons, of Exeter. The cross, which was formerly one of the finest in the West country, was originally erected by the Benedictine Monks of the Abbey of SS. Mary and Runon at Tavistock, and is in the main of 13th century work. The shaft is entirely new, and consists of a splendid monolith of grey Dartmoor granite—London Bridge is built of the same material, probably the best granite in the United Kingdom. North Lew, exposed as it is

to the storms and winds of the neighbouring bleak moor, is locally reputed to have been the place where, in some age remote, "the Devil died of cold," and the remains of his Satanic Majesty are said to have been buried afterwards beneath the now restored preaching cross.

City Church Remains Discovered.

EXCAVATIONS on the site of the Church of All-hallows-the-Great, Upper Thames Street, were recently begun by the City of London Brewery Company, to whom the property belongs. An ancient wall some 20ft. below the surface has now been brought to light. In the three spaces excavated the wall has been cut through after much labour, and the ends are open to view. It is of unusual thickness, and consists chiefly of stone, being of a solidity to almost defy the efforts of the workmen to loosen it. It is of very ancient structure, and is built upon huge oak beams. A difference of opinion seems to exist as to whether it is (1) a part of the old Roman wall which took its course along Upper and Lower Thames Street towards the Tower, or (2) a part of the foundation of the original church of Allhallows-the-Great, which was founded in 1361 by the Dispencer family. Mr. Charles Welch, the Guildhall librarian, expresses the opinion that the wall was that of the original church. The course of the Roman wall, it should be mentioned, could scarcely have gone up so high as the site in question. One point that supports the theory that the discovery is one of the foundations of the old church is that Sir Christopher Wren, when rebuilding churches after the Great Fire of London, always utilised, where practical, the foundations of the churches which had been burnt down. In this case, judging by the formation of the church of Allhallows-the-Great, which was razed to the ground only a few years ago, he probably used part of the foundations.

A Ruskin Exhibition.

A RUSKIN Exhibition was opened last Saturday at Coniston Institute, and will remain open for the ensuing seven weeks. There has been brought together a representative series of drawings, a number of portraits and relics, some rare volumes and manuscripts, and a few examples of—or after—those artists whose names Ruskin has made so familiar to his readers. The relics will appeal to anyone who knows "Præterita"; the manuscripts and drawings, arranged chronologically, and in most instances trustworthily dated, may be useful to students of Ruskiniana, and the drawings are a pictorial biography in themselves. The examples have been lent by Mr. and Mrs. Arthur Severn (the Brantwood Collection), Mr. A. Wedderburn, Q.C., Mrs. George Holt, Mr. and Miss Hilliard, Mr. and Mrs. John Bolding, Mr. James P. Smart, junr., Mr. F. Hollyer, Mr. Baxter, Mr. W. Collingwood, R.W.S., Mr. W. G. Collingwood, and the Trustees of the Ruskin Museum at Sheffield. The exhibits total 462.

The Exhibits.

THE first wall of the hall of the Coniston Institute contains work of Ruskin's juvenile period, aged ten to nineteen, in which, beginning with copies to amuse himself, and lessons from Mr. Runciman, he proceeded to imitate Turner's vignettes. Pencil-work drawings, after copying Prout, are next in order, and then attempts to learn colouring from Copley Fielding. In the 1835 sketches, when he was on the Continent, the progress in his drawing is very marked, and his 1837 picture is a "Cottage in Troutbeck" (applying colour to outline). The 1838 sketches are chiefly done on grey paper after David Roberts, R.A., and on a side wall are hanging a few of the fine series of drawings made in the autumn of 1840 and the spring of 1841. In 1842 his drawings were made in brown pen-and-brush work. The period of "Seven Lamps of Architecture" includes the paintings "Abbeville, 1848," and "Chapel at Reu, near Abbeville." Alongside are studies for "Modern Painters," to illustrate the drawings of mountains, and after this a group for "Stones of Venice" (1851-3). Two pictures entitled

"Capital" and "Sculpture at the Cathedral of Bourges, France," are from "Examples of the Architecture of Venice," and on a screen in the middle of the hall are sketches made in Switzerland in the sixties. An end wall holds a few copies and natural history studies, such as he made for his school at Oxford in 1871, and the remainder of the pictures illustrate Ruskin's drawings during the last ten years of his working life. There are also a few examples, original and copies, of the art work about which Mr. Ruskin has written, and mediæval manuscripts belonging to and framed by him. To Turner much space has been given. After Turner are a few frames representing Bewick, John James Ruskin (a drawing by John Ruskin's father), Samuel Prout, William Hunt, Sir Edward Burne-Jones, Meissonier, Miss Francesca Alexander, Miss Kate Greenaway, R.I., Albert Goodwin, R.W.S., Lawrence Jermyn Hilliard, Mr. Arthur Severn and Mr. and Mrs. W. G. Collingwood. Glass cases contain relics, manuscripts, printed works, photographs, &c.

An Artistic Bequest.

THE great art collection of the late Mr. Constantine Ionides, of Brighton, has been bequeathed to the nation. Two important conditions are attached to the bequest—the first, that the collection shall be kept together in the Victoria and Albert Museum and exhibited in a room or rooms and be termed "The Constantine Ionides Collection;" the second, that every object is to be exhibited and nothing hidden. This seems to involve not only the display in cases of the magnificent collection of engraved gems and similar objects which the late owner always kept in cases, but the framing and hanging of a vast number of fine prints which have hitherto been religiously retained in portfolios. There have been few collectors of taste so catholic as the late Mr. Ionides—everything, in fact, that was fine found in him an appreciative admirer; books, prints, gems, pictures, carvings, carpets, objects of every sort and of every age. Yet the collection does not strike the spectator as in any sense an *olla podrida* like the Soane Museum. It is just such a collection as a man of taste would wish to live with. These things were arranged about the rooms of Mr. Constantine Ionides' house, and no apartment, save the great library, built by Mr. Philip Webb, gave any suggestion of a formal museum.

Memorial to the Rifle Brigade.

A STAINED glass window has just been placed in Winchester Cathedral to commemorate the centenary of the Rifle Brigade and to perpetuate the memory of the officers and men who fell in the Soudan and in Crete. The window, which was designed by Mr. E. Kempe, is intended to convey the lesson of self-sacrifice for the good of others as being the true principle of the soldier's life. At the apex of the window is a crown surmounting a Maltese cross, which is encircled by a wreath tied with bands on which are inscribed the names of the chief battles in which the Rifle Brigade has at various times taken part. In the two top lights of the central division are represented the Crucifixion, with the figure of the centurion saying, "Truly this Man was the Son of God." Below are the figures of S. Stephen, S. Lawrence, S. Edmund, and S. Oswald, and the side lights are filled in with the figures of S. George, S. Maurice, S. Alban, and S. Martin.

New Baths for North London.—A large number of the principal residents of Islington inspected last Wednesday the additions and improvements which have been made to the public baths in the Hornsey Road, one of three sets of buildings which have been erected by the parish of Islington under the Public Baths and Washhouses Act. The additions include a new first-class swimming bath for women, thirty-seven additional private baths, a new establishment laundry, new engines and boilers, and two artesian wells with pumping machinery capable of raising 25,000 gals. of water per hour. The Baths Committee claim for these baths the distinction of being the largest set of baths and washhouses in the world.

Builders' Notes.

London County Council Improvements.—At the consideration of the London County Council (Money) Bill, which has already passed the House of Commons, by the Earl of Morley's Committee in the House of Lords some amendments were made involving the withdrawal of the amount set down in the measure in connection with the acquisition of Spitalfields Market. The sum so struck out was £177,500.

Registration of Plumbers.—The following committee was appointed last week (with power to add to its number) for the purpose of approaching the Government with a view to secure the introduction in the next session of Parliament of legislation dealing with the registration of plumbers:—Lord Hugh Cecil (chairman), Mr. John Aird, Mr. M. Austin, Dr. R. Farquharson, Mr. C. Fenwick, Sir W. Cameron Gull, Sir R. Hanson, Mr. Lees Knowles, Sir L. M'iver, Mr. J. Richardson, Mr. H. S. Samuel and Mr. J. Wilson.

London County Council.—At last week's meeting of the Council Mr. N. Robinson enquired whether it was true that there had been a financial hitch in the purchase of No. 17 Fleet Street, and whether it was true that the owner now wanted £1,300 in addition to the modest sum of £20,000 already agreed on. The chairman of the General Purposes Committee replied in the affirmative, adding that the matter was under consideration. It was recommended by the Asylums Committee that a central station for the supply of electricity and water should be provided at Horton Manor Asylum, Epsom, at a cost of £39,000. The station is intended to supply all the asylums which may be erected on the Horton estate. The tender of Messrs. T. and W. Farmiloe was accepted for the supply of paints from July 18th to December 31st.

Government Building Contracts.—At last week's sitting of the House of Commons Committee on War Office Contracts Mr. H. Wells, of the firm of Martin, Wells and Co., builders and contractors, stated that in 1899 they had a contract for certain buildings and works for the War Office. Certain irregularities arose in the payment of labourers on fraudulent notes. As soon as the irregularities were discovered they were directed not to pay unless the demand was signed by an officer. All the books of the firm were placed at the disposal of the War Office when they sent officers to make inquiries. In reply to the Chairman, Mr. Wells said he had had experience of these building contracts for the War Office for 45 years. In his opinion, it would be good for the War Office, good for the country, and good for the contractors if there were a right of appeal or an arbitration clause in all Government contracts. He challenged anyone to prove his work defective.

An alleged Encroachment of Foundations and a Gable.—The case of *Robinson and another v. Stevenson and another* was recently heard at the Shropshire Assizes. The plaintiffs claimed damages for an alleged encroachment in the course of the erection of a house. The defendants claimed that the land was their own, and, further, that, if it was not their land, what had been done was done with the full knowledge and acquiescence of the plaintiffs. In 1891 the plaintiffs purchased a plot of land. Subsequently the defendants purchased a plot of land next to it, and in May of last year they commenced to build upon it. Soon after it was found that they were building upon the land of the plaintiffs to the extent of 7in. The gable of the house came over it, and the footings under it. The plaintiffs, to oblige the defendants, had consented to the temporary removal of a wooden fence so as to facilitate the erection of the house, but they had objected to the foundations being partly laid on their land. Judgment was given for the defendants.

"Houses" or "Public Buildings": an Interesting Decision.—At Lambeth recently Mr. Priestman Moses, of Old Kent Road, was summoned by Mr. Ellis Marsland,

district surveyor for Camberwell, for failing to comply with a notice of irregularity served upon him under the terms of the London Building Act. In April 1897 the Local Government Board made an order giving the control of children of defective intellect or physical infirmity to the Metropolitan Asylums Board. The Asylums Board came to the conclusion that the most effectual way of dealing with such children would be to locate them in different parts of London in small homes in close proximity to the centres at which the London School Board provide special instruction for such children. In pursuance of that decision the Asylums Board purchased a house in Elm Grove, Peckham, and proposed to make alterations and additions with the view of adapting it for the accommodation of fourteen or fifteen children. In carrying out this work the architect, Mr. Charles Henman, proposed to retain the original wooden staircase and to place an outside iron staircase as a means of escape from fire. Mr. Marsland, the district surveyor, took the view, however, that this was the conversion of a house into a public building, and that consequently the terms of section 68 of the London Building Act, 1894, applied. That section requires that in every public building the floors of the lobbies, corridors, passages and landings, and also the flights of stairs, shall be of fire-resisting material and carried by supports of a fire-resisting material. Mr. Herbert Smith, who had been instructed by the Asylums Board to appear for the defendant, argued that this was not a public building, and that in regard to this dwelling-house the Board were in the same position as a private owner. In the result Mr. Hopkins upheld the district surveyor's contention and made an order requiring the defendant to amend the work in accordance with his (the surveyor's) requirements, but agreed to state a special case for the opinion of the Divisional Court.

Building Covenants on the Portland Estates.—The case of *Baily v. Lewis* came before Mr. Justice Cozens-Hardy in the Chancery Division last week. The plaintiffs, who were trustees of the Portland estates, moved to restrain the defendant, a draper, of Oxford Street, until the trial, from building in breach of a covenant. Counsel for the plaintiff stated that there was a passage called Hollis Passage between the premises occupied by the defendant in Hollis Street and Cavendish Buildings, and the defendant held a lease from the Portland Trustees which contained a covenant that he would not, without the consent of the trustees, erect any building or make any alteration in the premises. The defendant had built a wall which blocked the passage, and it was the desire of the trustees that the passage should be kept open. The defendant had a reversionary lease, giving him the soil of the passage, but it was provided that the passage must not be built on. The plaintiffs asked for an injunction to restrain him from dealing with the passage in any way inconsistent with the provisions of the building agreement. For the defendant, it was contended that it was intended that new buildings should be erected, and there was an understanding between the architect to the trustees and the defendant as to building on the passage. Mr. Justice Cozens-Hardy said it was not even alleged that there was any agreement in writing entitling Mr. Lewis to do what he had done. The defendant might have a good case at the trial, but, in the meantime, he must grant an interlocutory injunction.

Housing and Municipal Trading.—Mr. Sheppard, builder and contractor, Bermondsey, gave evidence against trading by municipal authorities before the Joint Committee of the two Houses on Municipal Trading. His view was that proper supervision, which was necessary for efficient work, did not exist in the case of municipal employment, and that it was unnecessary that local authorities should provide dwellings for the working classes, since private enterprise could compete with anything a county council could do in this direction. Mr. D. S. Waterlow, chairman of the Housing of the Working Classes Committee of the London County Council, and a director of the Improved Industrial Dwellings Com-

pany, gave an account of the operations of the County Council in the matter of the housing of the working classes. Until last year, when the Council adopted Part 3 of the Housing Act and decided to acquire a site containing an area of nearly 40 acres, the Council's operations had been restricted to the provision of new dwellings in lieu of those destroyed by them or their predecessors in carrying out various street improvements and clearances of insanitary areas. Up to March of the present year the Council had erected and finished dwellings to accommodate 10,000 persons, consisting of 48 blocks of dwellings and one common lodging-house. These buildings had been erected for a capital expenditure of £609,000, of which £101,690 was the estimated value of the land, and £507,000 the cost of the buildings. They were producing a gross annual income of £41,300. It was proposed to erect on the estate mentioned, situate at Tooting, 1,100 single and double cottages of various grades to meet the requirements of several classes of workmen. Accommodation would, it was anticipated, be provided for 8,400 persons. By means of tramways to Blackfriars, Westminster, Waterloo, and the Borough, access was given to the busy centres. It was anticipated that the laying out of the estate and erection of the cottages would involve an expenditure of £450,000. After further evidence the committee adjourned.

Workmen's Compensation.—The case of *Timmins v. the Leeds Forge Company, Limited*, came before Lord Justice A. L. Smith, Lord Justice Vaughan Williams, and Lord Justice Romer in the Court of Appeal last week. It was an appeal from the decision of Judge Greenhow, sitting at the Leeds County Court, under the Workmen's Compensation Act, 1897. The applicant for compensation was a labourer in the employment of the Leeds Forge Company. The question was whether the injury to the workman was caused by an "accident." The evidence was shortly as follows:—The applicant's duty was to lift planks of timber. On January 26, 1899, he was engaged in shifting timber from one heap in the yard to another heap. He had been moving the timber the day before and had no difficulty in moving it then. The timber consisted of pine deals 14ft. long, 11in. wide, and 3in. thick. On January 26th the planks were all frozen together, there having been a frost during the night. The applicant began work at 11 a.m. and had a difficulty in moving the planks from the beginning. At about 4.15 p.m. he bent down to lift a plank which was fast to some others with the frost, when he fell down in pain. The lower planks in the heap were more firmly fastened together on account of the rain and frost. He never had any difficulty before that occasion. The applicant was ruptured in consequence, and was injured. The County Court Judge found the above evidence to be true. It appeared that the applicant had been previously ruptured, but the County Court Judge found upon the evidence that he was practically cured of the old rupture, and was as good a man as he was before it, and was entitled to the same remedy as if this had been a rupture for the first time. The Judge also found that the rupture was, in fact, caused by the lifting of the timber and not by some other cause, and that it was, under all the circumstances of the case, an injury by accident arising out of and in the course of the employment, and that the employers were liable to pay compensation. He accordingly made an award in favour of the applicant. Counsel for the employers contended that there was no "accident" in this case. There was nothing fortuitous or unexpected. The workman knew that the planks were frozen together, as he had been working from 11 a.m. to 4.15 p.m., when the accident happened. The work was the man's ordinary work, which was rendered heavier than usual by the frost. The Court dismissed the appeal on the ground that the lower down the workman got in the stack of timber the harder the planks stuck together, owing to the rain and frost, and this was unknown to the workman. Accordingly, when the workman tried to lift one of the lower planks he ruptured himself, owing to the difficulty of lifting it, on account of its being frozen fast to the other planks.

Professional Practice.

Alloa.—The recently-formed Alloa Unionist Club proposes to erect a club-house in Union Street and Coalgate at a cost of about £2,000. Mr. John Melvin, of Alloa, is the architect. The main entrance will be from Union Street, and the ground floor will be reserved for a cloak room and lavatory accommodation. The stair leading to the upper storey will be finished in pitch pine. On this floor there will be a billiard room 32ft. 6in. by 27ft., giving accommodation for two tables. There will be a recess behind, about 23ft. long by 10ft. wide, the floor of which will be raised, and a settee formed all round. The roof will be open, and the room will be provided with all modern requirements. The secretary's room, 17ft. by 14ft., will be entered from a corridor 7ft. wide, and adjacent to it will be a reading room 31ft. by 15ft. 6in., both of which rooms will be lighted with corbelled oriel windows. It is also proposed to have a card room entering off the reading room and shut off by folding doors, so that when occasion requires the two rooms can be thrown into one, giving accommodation for 300 persons. The heating will be by means of open fireplaces, and it is proposed to light the whole premises by means of electric light. The entire surface of the walls will be treated with cement harling. The contractors are:—Mason and brick work, Mr. J. Phillip, Tili-coultry; carpenter and joiner work, Mr. R. Kier, Tili-coultry; slater work, Mr. J. Walker, Alva; plaster work, Mr. J. Grant, Alloa; plumber work, Mr. J. Philp, Alloa; painter work, Mr. J. Robertson, Alloa.

Barby, Rugby.—The church of St. Mary at Barby has been restored under the direction of Messrs. W. and C. A. Bassett Smith, architects. The work has taken two years. The church itself dates from the thirteenth century, although fragments of much earlier work were found buried in the plaster which covered the walls, and in the floor were included a number of Saxon coffins, with handsomely carved lids; one, which was replaced beneath the pavement in the south aisle, upon being opened, was found to contain a perfect skeleton. Fragmentary portions of delicate tracery and several very early frescoes were also found hidden beneath the plaster, and these, where possible, have been preserved by being built into the walls. With respect to the work of restoration, it may be said that all the walls, where not rebuilt, have been cleaned and re-pointed. The majority of the windows have been re-set, and the greater portion of the south wall and the whole of the columns supporting the arches have been re-built. The arches themselves, however, have not been interfered with beyond the cleaning process. New roofs have been erected over both north and south aisles, and also over the chancel aisle and chancel. The ceilings of the aisles are of fir, whilst that of the chancel is of oak. In the course of the work several arches and doorways, giving evidence of a much larger building, were discovered. In the south wall of the chancel a beautiful arch was found filled in with brickwork, and covered with plaster. The brickwork has been removed, the archway opened out, and now forms a side chapel, though it is not intended to utilise the same for such a purpose, the object being to restore the building to something like its former condition. At the west end the tower arch has been opened, giving free access to the belfry. A staircase by the side of the doorway on the north side, which was also discovered whilst the work was in progress, has been cleared, and found to lead to a small chamber over the north porch. The floor of the church has been lowered to its original level, and the doors have been made to open outwards. To attempt to define the character of the various windows would be rather a difficult matter, as no two are of exactly the same design, but in the work of restoration much delicate stone carving, which had been hidden from view, was brought to light, and has been utilised to the best advantage. The floors have been relaid with solid wood, whilst in the aisles the old paving,

as far as possible, has been used, with the addition of a bordering of fancy tiles. The chancel steps have been paved with tiles, made specially for the purpose, from the pattern of one found buried beneath the floor of the church. The pulpit has been retained, whilst the old communion rails have been brought forward to the entrance of the chancel, forming a low screen, and new communion rails have been provided. The old-fashioned high-back pews have been demolished, and, for the present, chairs will be used. Externally, there has also been much done in the way of renovation: the north porch has been restored to its conjectured original state, and an entirely new porch built at the south side of the church. Up to the present time £3,000 have been expended, but much more is still proposed to be done.

Bognor.—The new Duchess of Teck Memorial Home of Rest for Working Women and the Victorian Convalescent Home for Surrey Women—to give them their full titles—occupy a splendid position facing the sea, with a frontage of more than 200ft. The buildings, which have been erected from designs by Messrs. Lainson and Son, architects, of East Street, Brighton, are in the Renaissance style of architecture, and are simple in treatment. They are faced externally with red bricks and terra-cotta dressings, while the roofs are boarded and felted, and covered with red Broseley tiles. The external walls are built in two thicknesses, with a 2in. cavity between, thus avoiding any chance of damp penetrating through the walls. This arrangement will also tend to keep the rooms warm in winter and cool in summer, and will, to a very great extent, prevent the noise of the sea in rough weather from being heard in the home. The use of timber in the exterior of the building has been avoided, as in such a position it would be likely to be much affected by the weather. For the same reason, and as being more weather-tight, wrought-iron casements and frames have been used for the windows. By adopting this plan the periodical expense of external painting will be reduced to a minimum. The buildings have been planned to enable all the principal rooms to face the south, overlooking the sea, while the cloak rooms, staircases, bath rooms, lavatories, servants' bedrooms, &c., face north. The rooms are approached on both floors by a wide, well-lighted central corridor. The floors are of tubular fireproof construction, the ground floors being laid with pitch-pine wood blocks, wax-polished, and the upper with ordinary floor boards. Internally the walls are covered with "Serapite," a specially hard and non-absorbing cement, and the decorations are carried out in Duresco. The ventilation is effected by Boyles' inlet and outlet ventilators, and fanlights will be hung over the ward doors for the free circulation of air. The rooms will be warmed by open fires, which also assist the ventilation, while the corridors and dining-rooms of both institutions will be heated by hot-water radiators, from an independent boiler in the basement of the Victorian Home. The coal and beer cellars and boiler-house will be in a small basement. The drainage is thoroughly up-to-date, with necessary inspection and disconnecting chambers, all well ventilated, and connected with the sewers in the roadways. The two homes are quite similar in design and general arrangement; they are connected by a covered corridor, and will be under the superintendence of one matron.

Blairstown.—At the beginning of last year rumours were current about the instability of Blairstown Free Church, and Mr. William Mackison, F.R.I.B.A., city engineer, Dundee, was asked to report on the matter. In the face of Mr. Mackison's report it was imperative that something must be done, and the Deacons' Court, after fully considering the matter, recommended the congregation to form a building fund with a view to the erection of a new church. Funds were raised and designs by Messrs. MacMillan, Aberdeen, were adopted. These show a church in Early English Gothic style, with transept, aisles, apse, and a small back gallery. The halls are a special item in the scheme, a happy use being made of the present church, the walls of which are to

remain for this purpose. The main feature in the adaptation of the hall plan is a fine central vestibule or reception room, all the other rooms opening off this. The hall building will consist of a hall and class-rooms adjoining; these can be connected for special meetings to form one hall, which will then give sitting accommodation for 550 persons. In addition, there are minister's vestry, class room, cloak room, lavatories, heating chamber, library, waiting room, and, what is a distinct novelty in those parts, a "tea-kitchen," fitted up for providing for soirées, &c. The new church will be situated on the site of the present halls. The aisles are divided from the nave by stone pillars with stone arches, and clearstory windows above. The roof will be of circular form and timber-lined, having principals resting on stone pillars and corbels with intermediate ribs. Much attention has been paid to the heating and ventilation of the building, and the systems employed will be of the most modern and improved description. The sitting accommodation provided will be slightly in excess of that of the present church, and it is estimated that the total cost will be about £6,000.

Douglas.—The new Gaiety Theatre and Opera House, which has been built from designs by Mr. Frank Matcham, of London, has an auditorium roughly calculated to seat 1,750 persons; it comprises stalls, pit, circle, three private boxes on either side of the stage, and a fine amphitheatre, with a large gallery at its rear. The flooring of the basement is of black wooden tiles (dove-tailed), extending from the back of the pit to the orchestra. The gangways are wide, and the exits sufficient to allow the house to be emptied in a few minutes. The private boxes and the fauteuils in the stalls and the circle are upholstered in rich blue Utrecht velvet, and the amphitheatre and pit in repp of a similar shade. The proscenium has an opening of 30ft. by 28ft. There is an asbestos fireproof curtain, and an act-drop by Mr. W. T. Hemsley covers it. The stage, 68ft. deep by 56ft. wide, makes the production of big pieces possible, while the artistes' comfort in well-lighted dressing-rooms has been fully regarded. Mr. Phillips acted as clerk of the works and Mr. Alexander Gill, of Douglas, was the contractor.

Kirkcaldy.—In the new police buildings at Kirkcaldy, the accepted design for which is by Messrs. Williamson and Inglis, architects, of Kirkcaldy and Edinburgh, there will be 30 cells—22 for male prisoners and 8 for female—with matron's and turnkey's rooms, kitchen, doctor's room, &c. The police-constables are provided with large muster and recreation rooms, charge room, with telephone room and room for productions and stolen or found property. Separate rooms are also provided for the chief constable and his clerk, an inspector, a detective, and a sergeant. The court room is placed on the upper floor, as well as a magistrates' room, rooms for the fiscal and the clerk of the court, male and female prisoners, &c. A caretaker's house is also included in the scheme. The main block, containing the court and private rooms, will face St. Brycedale Avenue. The estimated cost of buildings is about £16,000, which sum does not include furnishings, boundary walls, or the laying out of the grounds.

London.—The new Passmore Edwards Boys' Club and Institute in Barking Road, Canning Town, E., has been built by Messrs. James Smith and Sons, of Norwood, from the designs of Mr. H. C. Lander, A.R.I.B.A. The site is irregular. The central part of the ground floor is occupied by the clubroom, which is lighted by two semicircular windows. Near the entrance to this room, and separated from it by a glass screen, is the manager's office, which will also serve the purpose of a general enquiry office. At the opposite end of the room is a counter where tea, coffee and light refreshments can be obtained; this room will be the general meeting-place for members. A fireproof staircase leads from the back of the clubroom to the reading-room immediately overhead; on the same floor are two classrooms and two smaller rooms at the back for chess and draughts. Returning to the same staircase access is given to the top floor, the greater part

of which is occupied by a billiard-room, containing three full-sized tables. Adjoining the billiard-room, and occupying the remainder of the top floor, are the caretaker's apartments. At the back of the main block on the ground floor, and more or less at right angles to the Barking Road, is the large Passmore Edwards Hall. This is entered from the Barking Road by the same doorway as that which serves the club premises. The hall, which will accommodate 280 persons, will be available for concerts, lectures, or as a gymnasium; at one end is a stage. Communicating directly with the stage are three retiring rooms, one of which will be devoted especially to members of the gymnasium and running club and is fitted with a shower-bath. In the half-basement under the stage and retiring rooms are three slipper-baths with hot and cold water, drying and store rooms for linen and towels, and a boiler room. The workshop occupies the top floor of this rear block. In addition to the club premises, and without any means of direct communication, is the public refreshment department, which has its own separate kitchen and larder. Electric light is fitted throughout. The main front is of red pressed bricks with terra-cotta dressings and strings. The foundations rest on gravel. The cost of the buildings is about £7,828, towards which Mr. Passmore Edwards contributed £5,000 and Mr. J. R. Roberts and Mr. W. H. Brown £1,000 each.

London.—The new baths and wash-houses for Bethnal Green were commenced in 1898 and have cost £20,000. Mr. R. Stephen Ayling, A.R.I.B.A., of Westminster, prepared the designs. Water is obtained from an artesian well which has been constructed at a cost of nearly £1,000, and from which a supply of 3,500 gals. an hour may be obtained. There will be no swimming bath, but in other respects the establishment is fully equipped. The machinery and other heavy equipment is naturally arranged in the basement; and there also are the store rooms and other offices for the working staff. The entrances to the baths have been placed in the principal frontage, on Cheshire Street, and are planned so that one attendant can issue the tickets to both sexes. Passing through spacious and well-lighted waiting halls, the baths are reached, namely, 20 men's second class, 10 men's first class; 10 women's second class, and 5 women's first. The large bath-rooms are divided into separate compartments by slate divisions, and painted in enamel. The whole of the baths are in porcelain from the Farnley Iron Company. Adjoining the Board School in Abbey Street is the laundry entrance and pay office. A somewhat unique feature is the long corridor for storing the perambulators in which the washers usually bring their linen; in most of the London baths this has been omitted, with the result that the waiting halls are often almost impassable. The ironing and mangling room contains three box mangles (all under-driven), with the necessary ironing tables, ironing stoves, &c. The public wash-house is at the corner of Abbey and Cheshire Streets, and is fitted with 40 washing compartments, and the same number of drying-horses. At the end of each range of washing compartments is an under-driven hydro-extractor. This apartment is ventilated not only by fanlights made to open, but also by an electrically driven fan in the turret. The appearance of the building is of a simple character, effect being obtained more by the colour of materials than elaboration of design. The materials generally are red bricks, Portland stone dressing and plinth, and Westmorland sea-green slates. The contractors were Messrs. Holloway, of Deptford, for the buildings, and Messrs. Berry for the engineering work.

Lynn.—A school room, the first instalment of the new Union Church buildings to be erected on Wisbech Road, was opened last week. The building was erected by Mr. W. F. Smith, of Lynn, from designs by Mr. J. L. Carnell, A.R.I.B.A., at a cost of just under £400. It is in the modern style of architecture with red brick facings, and all ornament has been avoided, both externally and in the interior, and the windows are large. Inside, the

walls are plastered, with a plain match-board dado in narrow widths, and the roof principals are of plain chamfered wood with iron tie rods. There is room for 160 sittings; the building is heated with an open slow-combustion tiled stove, and lighted with eight 16-candle power electric lamps, and there are the usual offices at the back. The school will for the present be used for public worship as well as for Sunday School work.

Surveying and Sanitary Notes.

The Drainage of Douglas is to be completed at a cost of about £30,000.

Improvements in Soho.—At a Consistory Court at St. Paul's Cathedral last Thursday, Dr. Tristram granted a faculty authorising the sale and conveyance of the fee simple of a portion of the churchyard of St. Anne's, Soho, to the Strand Board of Works for the purpose of widening Wardour Street. The churchyard was closed for burials in 1853, and any bodies disturbed are to be removed to Woking. The price agreed on was about £500, the Strand Board of Works to defray all costs.

City Building Leases still continue to command high prices. At the Mart, Tokenhouse Yard, E.C., Messrs. Farebrother, Ellis and Co. recently let on lease for eighty years the building site on which at present stand the Royal Ophthalmic Hospital, St. Mary's Chapel Schools and Chapter House, possessing a total frontage of 318ft. to Finsbury Circus, Blomfield Street and East Street, and occupying an area of 18,230 superficial feet. The bidding started at £5,000 a year, and after brisk competition the site changed hands for £9,500 per annum, or at the rate of about 10s. per foot annually.

Improvements at Margate.—The Margate Corporation propose to construct a promenade, commencing on the Parade, opposite Duke Street, and extending along the foreshore to Clifton Baths, reclaiming land where necessary from the sea. There will thus be provided a continuous promenade and carriage drive extending for about a mile and a half along the sea front, and having a width of 85ft. A cliff drive will also be made at Westbrook, which, when the new road is laid out in connection with the Bridewell Hospital estate, will form a cliff promenade extending half way to Westgate.

The Enlargement of the Law Courts.—At the fortnightly meeting of the Strand Board of Works last week the Medical Officer, in his report, called attention to the fact that the Government proposed to enlarge the present Law Courts by building on the open space bounded by the Courts and St. Clement's Lane. A short discussion ensued, the members considering that the only open space in the neighbourhood should not be built upon. A resolution was passed suggesting that the Government should build at the back of the Courts, where there was a space which had not been utilised.

Norfolk Bridges.—At the meeting of the Eastern Highways Committee of the Norfolk County Council, estimates were presented for the repair or rebuilding of four bridges—Besthorpe, Sutton (Wymondham), Billingford (near North Elmham) and Great Ryburgh. Mr. G. B. Ketteringham (Attleborough) was given the contract for the Besthorpe bridge at £119 10s.; Mr. Bowden (Wymondham) that for the Sutton bridge for £165 10s.; Mr. T. H. Blyth (Foulsham) the contract for rebuilding the Billingford Bridge for £205; and Mr. O. Tuthill (Fakenham) for the repair of the Great Ryburgh Bridge for £238.

The Widening of London Bridge, which the City authorities have in view, will undoubtedly be a work of great public utility. The precise nature of the scheme of alteration, with other important particulars bearing on the subject, cannot be known until the Bridge House Estates Committee present their report. It is understood that it is proposed to widen

the footpaths of the bridge on each side by means of cantilevers. Some members of the Committee are credited with thinking that the cost will over-ride the benefit, others that the general symmetry of the bridge will be spoiled, while a certain number desire to postpone all alterations for two or three years. The Corporation have also in view the improvement of the approaches to Southwark Bridge, and the establishment of a municipal steamboat service.

Addition to the Postmen's Park.—More than two years have passed since the movement for the extension of the Postmen's Park was commenced at the instance of the vicar and churchwardens of St. Botolph's, Aldersgate. For a while it seemed as if the project was doomed to failure, the sum asked by the Parochial Charity Commissioners—£12,000—being so large that there appeared to be little prospect of its being raised. Many of the City companies, together with the Corporation and the London County Council, have subscribed, however, and the sum has been all but raised, and the purchase completed. The opening of the new portion of the garden and the cloister erected by Mr. G. F. Watts, R.A., for the commemoration of "Heroes in Humble Life," will take place on Monday, 30th instant, when the Lord Mayor and Sheriffs will be in attendance. The memorial is of very simple design, and is attached to the wall of the building which runs at right angles to Little Britain. It consists of a red-tiled roof sloping from the wall, and is supported by seven pillars. The floor is about 7ft. wide, and runs a distance of some 50ft., while a seat stretches the entire length. Above the sloping back of the seat the space is divided into six portions by tiers formed of brown glazed bricks, and in these spaces memorials will be erected from time to time recording heroic deeds by people in lowly walks of life.

The Strand Improvement.—At the Guildhall, Westminster, last week, the case of *Guscombe and Mrs. Fanny A. R. Sandwith v. the London County Council* was decided before Mr. John Troutbeck, sitting as High Bailiff, and a special jury. It was a claim under the Land Clauses Act by the freeholders of the shop and premises 342 Strand, and Nos. 2, 4, and 6 Catherine Street, adjoining, for compensation for the compulsory acquisition of their property for the purposes of the Strand improvement. The property was stated to be owned by several families, and to form one of the finest business sites to be found in London. It was let on lease to Mr. White, a jeweller, who had occupied the shop at the corner of Catherine Street for 35 years. In 1891 Mr. White renewed his lease for 21 years, at a rental of £500 per annum for the first seven years, £600 for the second, and £700 for the third seven years. That by no means represented the value of the premises, but he was an old tenant. Then he sublet to other tenants, who paid £550 a year, Mr. White paying the rates and taxes. The plaintiffs claimed for their freehold interest as trustees under marriage settlements, &c., the sum of £24,319. Mr. F. T. Galsworthy, surveyor, of Waterloo Place, Pall Mall, Mr. Edward Bousfield, of Gresham Street, and Mr. Daniel Watney, of The Poultry, having given evidence in support of these figures, counsel for the L.C.C. said that the London County Council recognised that this was an excellent site and a first-class position, but he contended that the outside value was £16,000. Mr. Samuel Walker, surveyor, of Moorgate Street, and Mr. G. H. Glaisher, of St. James's Street, S.W., said they were of opinion that the property was worth £16,508; and Mr. James Green (Weatherall and Green) put the amount at £16,582. The jury awarded the claimants £21,578, including 10 per cent. for compulsory sale.

"The Architectural Review."—The delay in producing the July number—the Special Summer Number—of this magazine has been largely due to the fact that it contains a beautiful illustration of the well-known picture of "Perseus and Andromeda," by the late Sir Edward Burne-Jones. The "Review," however, was on sale on Saturday, and we feel sure that its contents will fully compensate for the delay experienced in its production.

Keystones.

An Exhibition of Mr. Walter Crane's work is to be held at Budapest in the autumn.

The Oldest Bell in England is stated to be one at Oughton, Lancashire, which dates from 1296.

A New Wing to the Bristol Lunatic Asylum, at Fishponds, has been completed at a cost of about £45,000.

A New Masonic Hall at Leeds is being erected in Great George Street. The foundation-stone was laid last week.

The Right Hon. J. M. Meade, late president of the Dublin Master Builders' Association, died suddenly on July 14th.

A Bust of Hahnemann, the founder of homoeopathy, who died in Paris in 1843, has been put up over his new tomb at Père-la-Chaise.

The Nurses' Home at Kensington Infirmary is to be enlarged. The designs of Mr. Ernest Flint, of 80 Coleman Street, have been adopted.

An Electricity Supply Station at Epsom is to be erected in Church Street, from designs by Mr. A. E. Pridmore, architect, of 2 Broad Street, Buildings, E.C.

Rougham Primitive Methodist Chapel, after being closed for renovation, was re-opened last week. It has been cleaned and decorated by Mr. Mason, of Massingham.

A New Church for Mickleton, Methley.—The Earl of Mexborough has given £1,000 to the fund for the formation of a new parish and the building of a new church.

All Souls' Church, Harlesden.—The east window of this church is to be filled with stained glass at a cost of £250, as a memorial of the late vicar, the Rev. H. E. Carlyon.

Park Chapel, Chelsea.—It is proposed to pull down this quaint old building and to erect in its place a church with a tall spire, designed by Sir Arthur Blomfield and Sons.

The New Buildings of the Dental Hospital of London, now being erected in Leicester Square, are estimated to cost £40,000, and to meet this funds are urgently needed.

A Memorial Tablet of the late Mr. George du Maurier, the celebrated "Punch" artist, has just been placed by Mrs. du Maurier on the front of New Grove House, Hampstead, now a Children's Home.

The Benedictine Church of St. Begh, Whitehaven, was re-opened last Sunday after alterations extending over eight months. This mission was founded 200 years ago, and the present building, by Pugin, dates from 1868.

Gift to Birmingham University.—Lord Calthorpe has given twenty-five acres of land as a site for the new scientific department of teaching and research which it is proposed to establish in connection with Birmingham University.

The Park Hall and Park Hotel, Hanwell, recently opened, has been designed by Mr. G. H. Pargeter. Messrs. Speechley and Smith, of Richmond, were the contractors, and the furnishings were supplied by Mr. J. Sanders, of Ealing.

The Death is announced of Mr. T. M. Lockwood, F.R.I.B.A., of Chester. The deceased was seventy years of age. Among numerous other buildings he designed the Law Courts at Chester Castle and the new buildings at the Chester Cross.

The New Glanadda Mixed Schools, Bangor, North Wales, are being warmed and ventilated by means of Shorland's patent Manchester stoves and patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Church Building Society at its meeting on Thursday last, at the Church House, granted a number of sums towards rebuilding, repairs, &c. The amounts included £1,000 for the new Church of St. Silas, Nunhead, and £100 for Christ Church, Kensal Green.

Royal Academy Elections.—Mr. Joseph Farquharson has been elected to fill the place

of Associate rendered vacant by the retirement of Mr. Philip Morris. Mr. Val Prinsep was chosen to fill the post of Professor of Painting, Mr. Herkomer, R.A., having resigned.

A New Wesleyan Chapel at Darley Dale is to be erected shortly from designs by Messrs. C. O. Ellison and Son, of Liverpool. The building will be close to the Whitworth Institute, and will seat 350 worshippers; the estimated cost is £2,600, exclusive of the land.

Bishop Heber's Church.—A movement is on foot at Malpas, Cheshire, for the restoration of the church with which the name of Bishop Heber will ever be associated. The Bishop's father, Reginald Heber, was the builder of the Rectory, and his mother was the architect.

Fire occurred at Messrs. Doulton and Co.'s factory in the basement of the terra-cotta department at Lambeth. With several fire-engines and three river floats the fire was got out before it did very serious damage. Immediately above the basement were 400 tons of partly manufactured pottery.

The Ruskin Memorial.—Mr. Onslow Ford, R.A., has accepted a commission to execute the memorial which, with the consent of the Dean, Mr. Ruskin's friends and admirers propose to place in Westminster Abbey. An appropriate site in Poets' Corner has been allotted by the Dean. It is above the bust of Sir Walter Scott.

Workmen's Cottages for Warwick. Warwick is feeling the need of workmen's cottages and has decided to borrow £3,500 for the purchase of common land known as the Pigwells for building purposes. It is proposed to improve a road, make another road through the new property and sell the remainder for building cottages.

Mr. Taubman, the author of the statue of Sir Sydney Waterlow which will be unveiled at Waterlow Park, Highgate, by Princess Louise, Duchess of Argyll, on Saturday next, has not long settled down to work in London, after studying and working on the Continent. A model of the statue occupies a prominent position at the Royal Academy Exhibition.

A New Dancing Hall for St. Pancras is being erected in Tavistock Place. Mr. F. W. Foster is the architect and Mr. J. Carmichael the builder. The hall will be 90ft. from front to back, and 36ft. wide. The ballroom will be on the ground floor. The lower portion of the building will be faced with stone, and the upper storey will be in red brick.

New Welsh College.—The Bangor City Council has decided to purchase the whole of the Bishop's Park for the city, at a cost of £15,500, and to offer six acres of it, valued at about £3,000, to the authorities of the North Wales University College, for the purpose of erecting a new college. The park is situated in the centre of the city, adjoining the cathedral.

New Hotel at Harrogate.—The Hôtel Majestic, the property of the Fredericks Hotels Company, Ltd., is the latest addition to the hotels of Harrogate. It stands in its own grounds of ten acres and overlooks the Valley Gardens and Spa concert-room. It is built of red brick and yellow sandstone, and has been furnished and decorated by Messrs. Maple and Company.

A New Institute at Hessle, Hull, is being erected from designs by Mr. Bilson, architect, at an estimated cost of £1,500. Mr. Marsden is the contractor. The new building will comprise on the ground floor a large room to contain three billiard tables, a bagatelle room to contain two tables, a games room, and, above, a Board and committee room, caretaker's rooms and the usual out-offices and conveniences.

London Board Schools.—At a meeting of the London School Board held last Thursday the report for the year ending March last was received. The total price of the sites purchased was £3,577,187 5s. 7d., and costs were £473,633 18s. 7d. The total number of permanent schools which had been erected and opened to Lady Day, 1899, was 439. During the year under review ten additional schools and six enlargements were opened, providing a total accommodation for 10,616 children.

The Building Trade, St. Andrews.—For several years back the building trade in the city has been exceptionally brisk, but all the big jobs have now been finished. There is practically no building going on now, and there seems no immediate prospect of any new houses being erected. At one time, not so long ago, houses could not be got, but the wants of the city in this respect seem for the present to be pretty well supplied. Many tradesmen have, in consequence, had to seek employment in other towns.

Cardiff's New Asylum.—On Monday last week Councillor Veall presided over a special meeting of the Cardiff Asylum Committee to consider applications from a large number of architects for an extension of time for sending in competitive drawings for the proposed new buildings. It was decided to grant 21 days' extension. The effect of this decision is that the designs in the preliminary stage of the competition are to be delivered not later than 12 o'clock noon on Saturday, September 15th.

The Organ in York Minster.—Respecting the condition of the organ in York Minster it was some time ago found necessary to consult Sir Walter Parratt, who pronounced it to be in "a thoroughly unsound condition," and deprecated any money being laid out in partial repair. The organ, indeed, has so rapidly deteriorated during the last few weeks that it has been found necessary to expend £50 to render it available for the daily services. The Very Rev. Dr. Arthur P. Purey-Cust, Dean of York, appeals for assistance to raise the sum of £4,000 necessary for its restoration.

New Underground Railway in Paris. Paris, after waiting nearly 30 years, has at last a section of its underground railway, and will be repaid for the inconvenience of months of upheaval of some of the principal thoroughfares. The Metropolitan or Underground Electric Railway from Vincennes to the Porte Maillot was opened on Thursday last. The intermediate stations are at the Place de la Nation, Lyons Terminus, Bastille, Hôtel de Ville, Palais Royal, Champs Élysées and Place d'Etoile. The line will thus give easy access to the Champs Élysées entrance of the Exhibition.

Church Bells Rung by Electricity.—In the parish of Runwell, Essex, an apparatus has been lately invented by the rector, the Rev. H. K. Harris, for ringing the church bells by electricity. The origin of the invention is rather curious. The rector finding a difficulty in obtaining bell-ringers rang the bells for three months himself. In order to save the labour involved in performing this task, he invented the "automatic ringer," and erected the apparatus in the church tower. By connecting the machine with the electric current already in use for lighting the church and rectory the bells are now rung with perfect order and precision. The "automatic ringer," for which a patent has been obtained, can be supplied to churches and buildings whenever required. The profits will be devoted by the rector to the fund for restoring his ancient church of Runwell.

The late Signor Segantini.—The wife of the famous Italian painter Segantini, who died unexpectedly of pneumonia last year in the Engadine, has written to the editor of the "Rivista di Studi Pschei" an account of a curious incident which occurred at their home on the Maleja 13 days before her husband's death. Segantini was then perfectly well, and had just finished his important painting entitled "Death," in which a mountain scene was represented, with the figure of a woman weeping over a bier. Segantini was resting in the studio when his wife entered, thinking him asleep. He then told her that, while quite awake, he had seen his own body on the bier, and had seen her weeping over it amid the scenery represented in the picture. Thirteen days later Segantini died in the small mountain cottage on the Schaffberg above Pontresina where he stayed while painting. The scene as his body was carried down the mountain was identical with that of which he had had so clear a vision 13 days before.

New Companies.

Foreign Lands Company, Limited.

This company was registered on July 10th with a capital of £24,000 in £1 shares (12,000 "A" and 12,000 "B") to acquire and deal with real and personal property, and to carry on the business of contractors, builders, miners, engineers, timber merchants, financiers, &c.

South-Eastern Brick and Terra Cotta Company, Ltd.

This company was registered on July 12th with a capital of £15,000 in £1 shares to acquire the business of a company of the same name (now in liquidation). The first directors (to number not less than three nor more than five) are G. H. Trollope, H. W. Trollope, J. R. Trollope and J. S. Brown.

Mill, Palmer and Co., Limited.

This company was registered on July 14th with a capital of £5,000 in £1 shares (2,000 five per cent. cumulative preference) to acquire the business of varnish, japan, colour, and oil manufacturers, chemists, &c., now carried on by G. M. O. Rogner, at 19 High Street, Wapping, E., as Mill, Palmer and Co. G. M. O. Rogner is sole managing director.

Ewesley Quarry Company, Limited.

This company was registered on July 12th with a capital of £10,000 in £10 shares to carry on at Ewesley, Northumberland, or elsewhere, the business of quarry and colliery owners and workers, coal and iron masters, brick and coke manufacturers, &c. The first directors (to number not less than three nor more than five) are to be appointed by the subscribers.

S. Blewitt and Co., Limited.

This company was registered on July 6th with a capital of £4,000 in £1 shares to carry on the business of colliery proprietors, ironstone dealers, coalmasters, coke manufacturers and merchants, brick, tile, terra-cotta and earthenware manufacturers, patent fuel makers, &c. The number of directors is to be two; the first are S. Blewitt and F. Minton, jun. (both permanent).

James Davie and Co., Limited.

This company was registered on July 6th with a capital of £1,500 in £1 shares to acquire the business taken over from the Domestic Appliances, Limited, by W. McIlroy, and to carry on the business of timber merchants, sawmill proprietors and manufacturers of and dealers in wooden articles of all kinds. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers.

South Coast Improvement Company, Limited.

This company was registered on July 13th with a capital of £5,000 in £1 shares to acquire land and property, and to carry on the business of builders, contractors, decorators, hotel proprietors, licensed victuallers, club proprietors, merchants, &c. The first directors (to number not less than two nor more than ten) are to be appointed by the subscribers. Registered office: Hatherton Chambers, Old Square, Birmingham.

Escolme Sanitary Pottery Co., Ltd.

This company was registered on July 6th with a capital of £10,000 in £1 shares to acquire the business carried on by F. W. Ison at Woodville, Derby, as the Midland Sanitary Pottery Company, and to carry on the business of potters, makers of sanitary and other earthenware, &c. The first directors (to number not less than two nor more than four) are T. E. Storey (chairman), Frederick W. Ison and T. C. Foster. Registered office: Woodville, Derby.

John Stenning and Son, Limited.

This company was registered on July 11th with a capital of £36,000 in £10 shares to acquire the business carried on at London, East Grinstead and Robertsbridge as John Stenning

and Son, to adopt an agreement with W. V. K. Stenning and A. H. Stenning, and to carry on the business of timber merchants, sawmill proprietors, iron and steel merchants, &c. The first directors (to number not less than three nor more than five) are W. V. K. Stenning (chairman), A. H. Stenning and W. J. Stenning.

Arklow Terra-cotta, Brick and Tile Company, Limited.

This company was registered in Ireland on July 16th, with a capital of £12,000 in £1 shares, to acquire lands in the townland of Ticknock, Arklow, held under lease dated April 5th, 1900, from the Earl of Wicklow, by Joseph C. Macraith and Thomas J. Troy, and their interest therein, and to carry on the business or trade of brick, tile, and terra-cotta manufacturers and potters. The first directors (to number not less than three nor more than five) are Vere Ward Brown, Arthur E. Mills, David L. Craig and Thomas J. Troy. Registered office: 1 College Street, Dublin.

R. and J. Creighton, Limited.

This company was registered on July 7th with a capital of £50,000 in £1 shares (25,000 preference) to acquire the business of timber merchants carried on at the Alexandra Sawmills, Carlisle, under the firm of R. and J. R. Creighton, and, generally, to carry on in all or any of their respective branches the businesses of timber and slate merchants, sawmill proprietors, builders and contractors, engineers and metal founders, &c.; and, further, to carry on in all or any of their respective branches the businesses of electrical engineers, electro-platers, brick and tile, pipe and terra-cotta makers, wood workers, cabinet makers, painters and varnishers. The first directors (of whom there shall be not less than three nor more than six) are R. Creighton, B. Scott, J. C. Dove, and J. Maxwell. Registered office: Alexandra Sawmills, Carlisle.

Taylor, Tunnicliffe and Co. (1900), Ltd.

This company was registered on July 9 with a capital of £100,000 in £1 shares (40,000 preference) to acquire, upon the terms of a certain agreement, the business of potters, &c., carried on under the firm of Taylor, Tunnicliffe and Co., Limited (incorporated in 1896), and generally to carry on in all or any of their respective branches the businesses of potters, earthenware manufacturers, colour grinders, &c.; also as manufacturers of and dealers in every description of appliances for electrical work; as general engineers and metal founders, boiler makers, wire and tube drawers, brassfounders and finishers, machinists, builders and contractors. The first directors (of whom there shall be not less than three nor more than seven) are to be elected by the signatories to the memorandum of association—T. Taylor, J. Grocott, F. Mountford, F. H. Pepper, A. L. Tangye, H. R. Winterton, J. W. Harvey. Registered office: Eastwood, Hanley, Staffordshire.

Guest, Keen and Co., Limited.

This company was registered on July 9th, with a capital of £2,000,000 in 200,000 shares of £5 each and 1,000,000 shares of £1 each primarily to adopt and carry into effect an agreement made between A. Keen and E. W. Richards and this company, to acquire by purchase or otherwise, as a going concern, the business, undertaking, assets, and liabilities of the Patent Nut and Bolt Company, Limited (in liquidation), and the ironworks and collieries carried on by Lord Wimborne under the style or firm of the Dowlais Iron Company, and as Guest and Co. in South Wales and London, to acquire a certain interest in hematite iron ore mines in North Spain, and, generally, to carry on in all or any of their respective branches the businesses of iron and coal masters, railway, general, and electrical engineers, bridge builders, coal merchants, brick, tile, and terra-cotta manufacturers, &c. The first directors (of whom there shall be not less than six nor more than eight) are F. W. Keen (and managing director), A. Keen, E. P. Martin, Viscount Duncannon, F. Gordon, E. W. Richards, J. W. Steevens, and A. T. Keen.

STAINES URBAN DISTRICT COUNCIL.
TO PAINTERS AND DECORATORS.

The above Council invite TENDERS for PAINTING and DECORATING the TOWN HALL. Designs and specification may be seen and further information obtained upon application to the Surveyor, at his Office, any day between the hours of ELEVEN a.m. and ONE p.m.

Tenders, under cover, endorsed "Decoration of Town Hall," to be sent to the undersigned on or before TWELVE o'clock Noon of WEDNESDAY, the 1st AUGUST, 1900.

The Council do not bind themselves to accept the lowest or any Tender.

E. J. BARRETT.

Assoc. M.Inst.C.E.,
Surveyor to the Council.

Town Hall, Staines,
July 12th, 1900.

LEYTON URBAN DISTRICT COUNCIL.
TO CONTRACTORS AND OTHERS.
PUBLIC STREET WORKS.

The Leyton Urban District Council invite TENDERS for PAVING, KERBING, &c., portions of Lea Bridge Road and Ruckholt Road. The paths are to be paved with Patent Indurated and Patent Adamant Stone.

Specification, quantities, and form of Tender may be obtained on application to Mr. WILLIAM DAWSON, M.Inst.C.E., the Council's Surveyor, at his Offices, Town Hall, Leyton, between the hours of TEN and FOUR (Saturdays, TEN and TWELVE), upon payment of One Guinea, to be returned on receipt of a bona-fide Tender.

Sealed Tenders, in special endorsed envelopes supplied with the forms, accompanied by a £10 Bank of England note to be enclosed with the Tender, and forfeited if the Tender is withdrawn before the contract is signed, must be delivered at the meeting of the Council to be held on Tuesday, the 31st day of July 1900, at the Town Hall, Leyton, at SEVEN o'clock p.m.

The Council does not bind itself to accept the lowest or any Tender.

Sureties will be required for the due performance of the contract.

R. VINCENT,

Clerk to the Council.

Town Hall, Leyton,
July 1900.

LEYTON URBAN DISTRICT COUNCIL.
TO CONTRACTORS AND OTHERS.
PRIVATE STREET WORKS.

The Leyton Urban District Council invite TENDERS for MAKING-UP, PAVING, and KERBING, certain PRIVATE STREETS within their district. The paths are to be paved with Patent Indurated and Patent Adamant Stone.

Specification, quantities, and form of Tender may be obtained on application to Mr. WILLIAM DAWSON, M.Inst.C.E., the Council's Surveyor, at his Offices, Town Hall, Leyton, between the hours of TEN and FOUR (Saturdays, TEN and TWELVE), upon payment of One Guinea, to be returned on receipt of bona-fide Tender.

Sealed Tenders, in special endorsed envelopes supplied with the forms, accompanied by a £10 Bank of England note to be enclosed with the Tender, and forfeited if the Tender is withdrawn before the contract is signed, must be delivered at the meeting of the Council to be held on TUESDAY, the 31st day of JULY 1900, at the Town Hall, Leyton, at SEVEN o'clock p.m.

The Council does not bind itself to accept the lowest or any Tender.

Sureties will be required for the due performance of the contract.

R. VINCENT,

Clerk to the Council.

Town Hall, Leyton,
July 1900.

TO BUILDERS.

The Governors of the Ashby-de-la-Zouch Grammar School invite TENDERS for the ERECTION of GIRLS' SCHOOL for 200 pupils, with Head Mistress's House to accommodate 50 boarders.

Plans and specification may be seen, and lithographed copy of quantities obtained, upon application to Messrs. BARROWCLIFFE and ALLCOCK, Architects, Loughborough, up to SATURDAY, JULY 28th, accompanied by a deposit of Two Guineas, which will be returned upon receipt of a bona-fide Tender.

Tenders, endorsed "Tender for New Girls' School," must be delivered at our Office not later than TWO p.m. on SATURDAY, AUGUST 4th next.

JOHN GERMAN and SON,

Clerks to the Governors.

Ashby-de-la-Zouch,
July 17th, 1900.

PARISH of ST. PANCRAS, LONDON.

LEAVESDEN SCHOOLS, near WATFORD, HERTS.

The Guardians of the Poor of the Parish of St. Pancras invite TENDERS for proposed PAINTING, DISTEMPERING, and other REPAIRS at the above Schools.

The specification and form of Tender can be obtained at the Offices of the Surveyor, Mr. W. T. FARTHING, 46 Strand, W.C., between the hours of TEN and FOUR, upon depositing the sum of Two Guineas, which will be returned to the depositor if he sends in a bona-fide Tender in accordance with the terms of this advertisement.

The Tender must be accompanied by the summary fully priced, and no Tender will be considered unless so accompanied.

Tenders, which will be received and considered only on the printed form, which must not be varied, must be sealed and endorsed "Tender for Painting, &c., Leavesden Schools," and are to be addressed to the undersigned and delivered at the Vestry Hall, Pancras Road, N.W., not later than TWELVE o'clock on THURSDAY, the 2nd AUGUST 1900.

The Guardians do not bind themselves to accept the lowest or any Tender.

ALFRED A. MILLWARD,

Clerk to the Guardians.

Vestry Hall,
Pancras Road, N.W.,
July 1900.

TO PLASTERERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the PLASTERING WORK at the Patent Office Extension (Library Block).

(1) On the basis of the specification.

(2) Alternatively—substituting Granite Silicon Plaster. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Mr. HENRY TANNER, at this Office.

Bills of quantities have been prepared for the use of plasterers by Messrs. WELCH and ATKINSON, of 10 Lancaster Place, Strand, and Messrs. FRANKLIN and ANDREWS, of 25 Ludgate Hill, and together with forms of Tender may be obtained at this office on payment of One Guinea. The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon on FRIDAY, the 3rd of AUGUST, addressed to the Secretary, H.M. Office of Works, &c., London, S.W., and endorsed "Tenders for Plasterers' Work, Patent Office."

H.M. Office of Works, &c.,
Storey's Gate, S.W.,
July 1900.

PARISH of ST. MARY, STRATFORD, BOW, LONDON, E.

TENDERS FOR PUBLIC LIBRARY.

The Vestry of the above-named Parish is prepared to receive TENDERS for the ERECTION of a PUBLIC LIBRARY in Roman Road, Bow, E.

Persons desirous of Tendering are requested to send their names to the undersigned not later than 31st JULY next, together with a deposit of a Bank of England note for £10, which will be returned after the Tenders have been considered by the Vestry, and provided the Tender is bona-fide and has not been withdrawn.

To each person making such deposit will be sent a copy of the bills of quantities and form of Tender prepared by Messrs. YOUNG and BROWN, Quantity Surveyors, 7 Southampton Street, Bloomsbury Square, W.C.

The plans, specifications, and conditions of contract may be seen at the offices of the "Architect," Mr. S. B. RUSSELL, 11 Gray's Inn Square, London, W.C., between the hours of TEN a.m. and FOUR p.m. on any week-day.

Sealed Tenders to be enclosed in endorsed envelopes supplied with the forms and to be delivered at my Office not later than TWELVE noon on the 13th AUGUST, 1900.

The contractor whose Tender is accepted, and with whom a contract is entered into, will be required to enter into a bond with sureties for the due performance of the contract, and he will also be required to pay the whole of his workmen such rates of wages and observe such hours of labour as are recognised by the workmen's trades-unions and in force at the signing of the contract.

In the event of any breach of such agreement the Vestry will enforce the penalty clause.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order of the Vestry,
FRANCIS KNIBBS,
Vestry Clerk.

Bow Vestry Hall, Bow, E.

An Architectural Causerie.

Students' Work at South Kensington.

THE National Competition this year appears to be about on the level of the last few years. In a few

classes the works are of considerable excellence, but for the most part the designs are marked by the same mannerism which has now been common for several years, a mannerism which exaggerates the value of quaintness of line with a resultant thinness, and almost ignores the equally important consideration of design in mass, without the use of which dignity cannot be obtained. Another general defect is the fondness for perpendicular and horizontal lines or divisions in the designs, a device which is occasionally effective, but which soon palls. The colour is as often good and sometimes even striking, as should be the case in the work of a nation which certainly possesses the gift of colour, whatever its shortcomings may be. The effect of a repeat from a little distance has rarely been realised by the students, and many fillings are quite useless from a commercial point of view because of the distracting and unexpected general forms which appear as one retires from them. Several in which human figures are very prominent are naturally failures, the repetition of a figure with the same gesture at intervals over a surface being unpleasant and even sometimes appearing foolish. Among the architectural designs there is but one which is satisfactory, though there are several very ambitious things, crammed with elaborate ornamental design. The proportions are generally unsatisfactory, a failing which is not confined to the architectural designs. See, for instance, the metal work, where again the determination to introduce the figure leads sometimes to rather surprising results. In this class, however, there are some very tolerable designs, especially among the modelled work and the designs for jewellery, in which the mingling of enamels, metal and precious stones is often very well managed. Some of the designs sent from Birmingham, with worked out specimens attached, give hope that the commercial jewellery to which we are accustomed may in time give place to something better worth buying. The leather work also is pleasant and effective. The strong tendency towards "L'Art Nouveau," which is often offensive in design for other materials, is not so objectionable in this, nor in lace and damask, in which, indeed, the long thready lines are often really effective. In lace the process of reproduction is so abstract that great range of subject as suggestion lies open for the choice of the designer, and the designs shown are for the most part good. The same remark applies in a less degree to white damask, and in this class also many of the designs are good. The embroidery is occa-

sionally good in colour, but almost always over-fantastic in design. A few of the printed hangings are good, but most of them err in the directions indicated already. The tiles are tolerable, and so are a few of the pottery designs. The stained glass is pictorial in composition for the most part, though the latest fads in the way of cutting and leaving out painting have been caught up, and in several cases the mullions cut across figures quite in the bad old way. This imitation of modernity is indeed characteristic of most of the designs shown in every class, and one would like to suggest to both students and masters that imitation is equally bad whether the thing imitated be new or old fashioned, and that what is wanted is really original thought. The posters are particularly open to this objection, though several of them are clever. The designs for book illustration are also very mannered and restricted in scope, though often clever, but one set at least is not admirable even on the accepted lines. An instance of unsuitable application of material

and well balanced, and no doubt, when the cartoons are drawn full size, these defects will be remedied. The section of architectural drawing from measurements, a very useful section, contains some good and interesting drawings, and the drawings of birds treated for design are good, while those of plants vary in excellence, some being mere labour without intelligence: the work from the figure, both antique and life, is about up to the usual level, but what good purpose can be served by the elaborately shaded drawings of arrangements of drapery? These would be more useful painted or drawn in a more rapid way, special studies being made of details not well understood. The modelled work is much of it very tolerable, particularly the designs in flat relief, while the figures executed under M. Lanteri are many of them beautiful in pose and rendered with feeling and intelligence. The Examples of Local Personal Examinations are not encouraging. In the "Glass for a Library Window" one design is prettily arranged. The sign "The Robin Hood" is the best of the set, where

EAST PAVILION, CAMPDEN HOUSE, CHIPPING CAMPDEN,
GLOUCESTERSHIRE. DRAWN BY PERCY D. SMITH.

is afforded by some book covers ornamented with gesso—a purpose to which it is quite inapplicable, inasmuch as a book is an object which would be continually handled. One is glad to see pieces of woven stuffs and squared drawings for textiles, but it is noticeable that the highest award to such practical exhibits consists of a silver medal, while gold medals have been awarded to eccentric drawings which can scarcely be considered equally practical, and which are not always better from the point of view of design. Of nine gold medals awarded in general competition four are given to printed or stencilled fabric and one to embroidery, which seems unduly favouring design of this sort at the expense of other forms not less important. One may congratulate the winner of the gold medal on the thoughtful scheme of decoration for the entrance hall of the Polytechnic, Regent Street, especially if the design is to be carried out, as is suggested. The background is rather dark for any place not exceptionally well lighted, and even on the present scale the surfaces of drapery, &c., are rather empty, but the grouping is pleasing

three out of four designs are fairly good in one way or another; but the modelling for honours, "A Chimney-piece and Overmantel," shows faulty proportion and misunderstanding of structural requirements in every design, though the figure panels are pretty. An examination of the list of prize-winners reveals some curious facts. Of the gold medallists four take national book prizes for similar forms of design to those so highly premiated. Nine of the silver medallists take bronze medals also, and two take book prizes in addition, while nine others take book prizes. Among the bronze medallists fifty book prizes are awarded. Out of eight bronze medals awarded to one school five are gained by one student, and in the same school five book prizes are gained by two other young ladies of the same name. In another school one student takes two bronze medals and three book prizes, and another one silver medal and three book prizes; while no less than 315 prizes of different sorts are distributed between eight schools, not counting South Kensington, which naturally comes in for a shower of honours amounting to 258. S. S. G.

"Tin Tabernacles" and the Brick-makers.

THE letting by the War Office of contracts to the amount of over a hundred and sixty thousand pounds, for galvanised iron barracks to be erected on Salisbury Plain, is a sign of the times which, taken in conjunction with many other similar contracts for public and private work, may well give the brickmakers food for reflection. For the last few years the brickmaker has been regarded as the spoiled child of fortune among the building trade's manufacturers, and not without reason. Great railway and other engineering works have been in progress, and house-building in these latter days of unexampled prosperity has proceeded in wholesale fashion, to the end that bricks of every kind, from the hard "blue Staffordshire," greatly in vogue for engineering works, to the soft "red rubbers" for delicate enrichments, have sold at greatly enhanced prices; while "stock" and "place" bricks, although turned out in these times in such enormous quantities by keenly competitive firms, have not infrequently been practically unobtainable, even at twice or almost three times their normal value. Happy have been those builders who have had contracts with brickmakers and doleful the condition of the small speculative man who, working on a small margin of profit at the best of times and always with insufficient capital, has had to endure long waits for his bricks and then to pay extravagantly for them. The brickmakers who had not contracted to supply for long periods at current prices before the boom set in have been for some time past engaged in reaping a very fine harvest. Others have embarked on still larger enterprises; while the rumour of fortunes to be made in brickmaking has induced outsiders to sink much money in the industry. Indeed, there has been something very much like a gamble in bricks, and it is an apposite question whether, after all, the boom has meant prosperity at large to brickmaking firms. We know that it has been the last straw that has broken the heavily-burdened back of many a small speculative builder of suburban villas, whose career is not at the best of times a rose-strewn path; but is it not likely that in the over-production and over-much competition of late the long-suffering man is going to get his own back, in the shape of stock-bricks at very low prices? Of course, not even so large a contract as that just entered upon for iron barracks really means much to the brick-making industry at large; but when we come to consider that this is only one of many similar contracts, large and small, and when we find local authorities strongly in favour of corrugated galvanised iron for hospitals and other public uses, the conclusion cannot but be arrived at that the pinch must needs be felt somewhere before very long. Then the reverse side of the boom will be revealed and the folly of arguing a continued from a temporary inflation will be made manifest alike to those who have enormously increased their responsibilities and to those who have entered upon brickmaking at the top of the demand and cannot start their output until prices begin to be on the down grade. Whether we like it or not, the iron building has evidently come to stay, just as the temporary "tin tabernacles" of the various religious bodies have proved more permanent than one could wish. Perhaps, though, in any great slump in bricks, the position will be again reversed and brick buildings prove cheaper than iron. They will, however, naturally enough, never be so readily put together or taken apart as iron buildings, and not alone for barrack-huts or for hospitals (where doctors believe in them for obvious sanitary reasons), but also for temporary holiday cottages and numerous other uses, light iron structures have an assured and constant use.

C. G. H.

On Reflection.

The "Methodist Times" and Restoration.

WE commented recently upon a remarkable proposal by the Rev. Hugh Price Hughes that a certain millionaire acquaintance of his should relieve himself of some of his embarrassing wealth by restoring the Acropolis at Athens. Mr. Hughes invited criticism upon his scheme, and, taking him at his word, we pointed out its uselessness from an artistic and educational point of view, its bad taste, and its obvious absurdity if carried to a logical extreme. The "Methodist Times," Mr. Price Hughes' organ, is not pleased with our criticism, in which it detects the vices of ignorance, prejudice, and anonymity; and the anonymous writer of its note on the subject specially objects to our saying that the rebuilding from the original materials of a small temple on the Acropolis, which took place some years ago, is a very different matter from the restoration which Mr. Hughes contemplates. "As a matter of fact," says our contemporary, "it is not a very different matter, but precisely the same matter." Now, no one who reads Mr. Hughes' article could doubt that the restoration he contemplates is something much more thorough and drastic than the re-erection of the broken pieces that are lying about the Acropolis. It is to be a rebuilding with new material, it is to cost a million pounds, and is to result in as close a replica of the Acropolis in the days of its first splendour as can possibly be obtained. We have no objection to the preservation of a building which is falling into decay; on the contrary, we welcome it, and we are not pedantic enough to object to the modicum of new work absolutely necessary to arrest the process of destruction. It is to the restoration of that which the ravages of Time or War have destroyed that we take exception. And the inability of the writer in the "Methodist Times" to see any difference between the two processes does not alter the fact that they are as different as truth and falsehood, reverence and contempt. There is another point which those who talk lightly of restoring the Acropolis do not perhaps appreciate. Do they really know what the buildings on the Acropolis were like? There is much disagreement among the best authorities on many points, and much of the new work would be purely conjectural. Again, do they propose to instruct English workmen in Greek methods of building, or is it proposed to attempt to reach the Greek result by modern English methods? But there are no end to the difficulties that would arise. The only safe plan is to preserve carefully what exists, but not attempt to copy that which belongs to a past age.

The Westminster Improvement.

THE London County Council has accepted the amendments of the Lords to the Westminster Improvement Scheme. True, this desirable result was not accomplished without a display of unreasoning and petulant prejudice on the part of some members against the House of Lords; but that it was accepted at all is a sign of grace for which one should be thankful. There is a disposition on the part of some members to imagine that all opposition to their schemes is the opposition of interested parties with vested interests. It does not seem to occur to them that there is, possibly, a better way of doing the same work, and that suggestions or amendments are brought forward to give effect to a better method. The L.C.C. was very sore over the opposition to its Welsh Water Scheme; but its rejection was due rather to serious faults in the scheme itself than the perfectly

natural opposition of the water companies to extinction without compensation. In the case of the Westminster Scheme one can say that all's well that ends well, and to Mr. John Burns much of the credit is due for this happy result, for he appears to have enlightened some very ignorant members of his following concerning their own property. Consequently we shall have a really artistic improvement where it is much needed, and one which will improve the approach to our national Parliament building, as much as it ever can be improved, for it becomes more and more apparent every year that the building of the Houses of Parliament in their present situation was a gigantic blunder, and though from the river the block may look well enough, the building is in a hole on the land side and the entrance is mean and undignified. Any scheme that will mitigate this great defect is therefore doubly welcome.

London Scavenging.

THE removal of house refuse and the cleansing of the streets are two sanitary matters that occupied a large space in last week's London dailies. Our contemporaries generally complain of the practice of putting out refuse bins, &c., on the pavement for the dustman to collect, on the ground that disease germs are communicated to passers-by and that much of the refuse is decaying and creates a stench. Now it is not so long ago that the L.C.C. adopted this criticised system on sanitary grounds, and the Press hailed the new order of things as a distinct advance in sanitary science. And if refuse can become so offensive in less than 24 hours, it stands to reason that the Council was right in insisting that it should be disposed of daily, and if we revert to the old backyard order of things, not only will a large amount of refuse remain uncollected, but the work of collection will be immeasurably prolonged. We can see nothing wrong with the system, and it is the most sanitary that could be devised. Certainly the Council could and should issue stronger regulations about proper covered metal bins, because the majority of the receptacles are merely wooden boxes in a filthy and insanitary condition. Any defect in the system seems to us to be in the collecting, and in the majority of parishes there are neither sufficient carts nor men for the work. We suggest that each parish should keep a list of the restaurants and eating houses in its jurisdiction and that the proprietors of these places be required to deliver up their refuse two or three times a day, or to put it out when they close at midnight, so that it can be collected in the night. The stench arising when the refuse is collected from the Strand restaurants about 9.30 in the morning is perfectly nauseating. We would also suggest that the bins after being emptied should be dusted inside with some powder disinfectant. When our contemporaries come to the question of street scavenging they are on safer ground, for in the majority of London parishes it is practically neglected. Only one body, the Strand Board, deals with the matter in a proper manner. To see Covent Garden Market and all the streets leading thereto at 9 o'clock in the morning and again at 1 o'clock in the afternoon would be a revelation to some people concerning the work accomplished by this Board. But if other districts are not properly scavenged the public should heckle the authorities and not write to the papers. Every paving material at present in use has one if not two serious drawbacks, and there is no use whining about it. You cannot eat your cake and have it. Until the perfect paving appears every ratepayer should see that his Board or Vestry carries out the principal work which it was elected to deal with, and if he neglects to do so he deserves to suffer.

THE ARCH OF TITUS, ROME.

SOME ANCIENT ROMAN MONUMENTS.

ROME, the Eternal City, is a city of inexhaustible interest. The historian, the antiquary, the man of letters, the artist, the architect alike recognise the fascination of this wonderful city, and even the ordinary tourist—unless he be a very strangely constituted person indeed—can hardly fail to find a visit to Rome a memorable and impressive experience. In the following brief notes no attempt is made at anything like a comprehensive survey of the objects of architectural interest which the visitor encounters on every hand; our object is merely to give a few particulars of the famous and interesting examples of ancient Roman art shown in our illustrations.

The triumphal arches of Rome were at one time very numerous; in the later years of the Empire there were nearly forty, but only about a dozen now remain. First in importance is the Arch of Titus, which stands at the highest point of the Sacra Via. It was erected by the Senate, as we learn from the inscription at the top, to commemorate the taking of Jerusalem in the year 70 A.D. The style is that prevalent in the time of Domitian, with a superabundance of carving in the architectural lines. Only part of the arch as it is seen to-day is the original structure; the rest is a modern restoration, built to hold the arch together. In the twelfth and thirteenth centuries this arch had been made by the powerful family of the Frangipani the nucleus of a hideous castellated fort from which they carried on incessant warfare with their neighbours, while the lofty dwelling-house erected on the arch itself had crushed it down. To ensure its safety after the demolition of the later structures by which it was partly supported Giuseppe Valadier took down the whole structure piece by piece in 1822, strengthened the foundations and reconstructed it in its present form. Travertine was the material employed for the new work, which is thus easily distinguishable from the old, which is in Pentelic marble. This travertine (*lapis Tiburtinus*) was much used as a building material in ancient Rome. It is a pure, hard carbonate of lime, of a creamy white colour, deposited from running or dripping water. It is a good weather-stone, but is soon calcined by fire. The Arch of Titus is interesting architecturally as being the earliest known example of the Composite order.

The bas-reliefs on the side of the arch are of exceptional interest. In the one on the left Titus is shown returning from battle in triumph in a four-horse chariot, the reins borne by a female

figure representing Rome. He is surrounded by his victorious army, while the captive Jewish priests and generals are dragged in chains at his wheels. In the other bas-relief the Jewish captives are seen bearing the spoils from Jerusalem, and among them the famous Golden Candlestick of the Temple. On the right can also be seen the table of Shew Bread and the Sacred Trumpets. The half arch at the extreme right is intended to represent the Temple itself tottering to ruin. Near it is a group of captives. These relics were deposited in the Temple of Peace in A.D. 75, five years after the conquest of Judæa, together with a collection of works of art: but what became of them eventually is unknown.

The Arch of Constantine was erected in A.D. 315 to commemorate the victories of Constantine, the first Christian Emperor. Art in those days was at its lowest ebb, and in the dearth of creative talent recourse was had to stealing from existing monuments. The greater part of the entablature, the eight columns, the eight medallions and the statues of the Dacian kings were taken from a triumphal arch of Trajan which spanned the Via Appia. The inside of the structure is built with a great variety of materials taken from other monuments; the bricks alone are contemporary with Constantine. The arch was restored in 1731 under the direction of Alessandro Capponi, whose restoration seems to have been of a very drastic character, inasmuch as he replaced a missing column and the heads of several statues which had been removed.

Another arch of which we give an illustration was that of Drusus, which was erected by decree of the Senate in honour of the father of the Emperor Claudius. It was built of African marble. Caracalla, at a later date, barbarously took advantage of it to carry across the Appian Way the aqueduct which supplied his palace with water. The remains of this aqueduct can still be seen in the somewhat unsightly mass of brickwork on the top of the arch.

Ancient Rome must have been marvellously rich in statuary, though the great bulk of it

has now disappeared. We illustrate one or two of the more famous examples which still remain. The statue of the dying gladiator is one of the best known. It was this statue which inspired Byron's famous lines beginning:

"I see before me the gladiator lie,
He leans upon his hand, his manly brow
Consents to death, but conquers agony."

The Laocoon statue is another famous group. It stood in the palace of the Emperor Titus and was spoken of by Pliny as superior to all other works both of painting and statuary. The story it depicts is the familiar one related in the Second Book of the "*Æneid*"—of the priest

STATUE OF MARCUS AURELIUS.

of Troy wrestling with the serpent sent by Apollo to devour him and his sons. The whole group—the father, the sons, and the awful folds of the serpent—were hewn out of a single block by three Rhodian sculptors—a father and his two sons—a touching analogy between the authors and their work. This splendid work of art narrowly escaped destruction: it was dug up in 1506 in the Vineyard of Felice de Fredis where it had been buried.

The statue of Marcus Aurelius, who became Emperor in A.D. 161, is one of the most perfect ancient equestrian statues in existence. It is

THE ARCH OF TITUS: THE CHARIOT.

THE ARCH OF TITUS: RELIEF OF THE GOLDEN CANDLESTICK.

the only survival of a great number of bronze statues which once adorned the city; the rest—it is surmised—have been at one time or another melted down into coin by impecunious vandals. It stood in the Lateran during the Middle Ages and was then supposed to represent the first Christian Emperor, Constantine. It is perhaps to this accident that its escape from destruction is due. This statue was greatly admired by Michael Angelo, and Hawthorne remarks that "the aspect of dignity, as it were, clothes the figure with an imperial robe of light. It is the most majestic representation of the kingly character that the world has ever seen. He stretches forth his hand with an air of proud magnificence and unlimited authority, as if uttering a decree from which no appeal was permissible, but in which the obedient subject would find his highest interests consulted—a command that was in itself a benediction." During the rejoicings on the occasion of the elevation to the Tribuneship in 1347 of Rienzi—the last of the Roman Tribunes—one of the nostrils of the statue was made to flow with wine and the other with water.

The statue of St. Cecilia is one of more recent date. It was sculptured in the sixteenth century, when the tomb of the saint, who was martyred in the year 224, was opened. But our concern in these brief notes is mainly with the monuments of ancient Rome. Apart from these there is, of course, a great amount of mediæval art work—paintings, sculpture, and architecture—which is of the greatest possible interest, but the consideration of these would demand a separate article—or rather many articles—and is beyond the scope of our present purpose.

New Premises of the Empress Club.

So great has been the success of the Empress Club, founded in commemoration of the 60th year of the reign of Queen Victoria, that an entirely new and imposing building has been erected two doors from the original premises in Dover Street, Piccadilly, to provide extended accommodation for the 3,000 lady members of which the club consists. This seven-storey building, which has cost £40,000 to erect from the designs of Messrs. T. J. Wimperis and Arber, and many thousands of pounds to furnish, was informally opened last Wednesday. There is a stately reception hall, a Louis XV. drawing-room, a Georgian guests' dining-room, luxurious reading and "At Home" rooms. The club premises, set aside for members only, are on the first floor, where there are three drawing-rooms, one of which is placed at the disposal of those members wishing to give private parties, and a large dining-room. On the same level is a terrace garden. Bed-rooms occupy the upper part of the building, which is well fitted with lifts.

THE PARIS EXHIBITION.

By F. HAMILTON JACKSON.

I.—THE BUILDINGS.

THE EXHIBITION is so vast that it is almost impossible to grasp even the most salient points without a lengthened stay in Paris, and many visits. To merely walk from the Champ-de-Mars entrance up to the Trocadero, turn to the right, through Vieux Paris, and along the Cours la Reine, called the Rue de Paris, to the great and little palaces, across the Pont Alexandre III. to the Invalides entrance, returning on the other side of the Seine through the Rue des Nations, with the pavilions of the various countries and that of the Armies of Land and Sea, entails a journey of several miles, without making any of those détours which can hardly be resisted to see objects which appear a little way off down side openings. It is not a commercial success, owing perhaps partly to the insults which the French caricaturists showered upon Her Majesty and to the sympathy which the French

press showed for the Boers, which have prevented many English and Americans from visiting it and spending their money in Paris; and I am told by those who have carefully examined the exhibits that from the point of view of manufactures it is not a success also; but, thank Heaven, I have nothing to do with that! It is a most interesting Exhibition, however, for anyone who is interested in architecture and decoration. Apart from the intentional decoration of the architectural palaces, one finds everywhere reproductions and reductions of historical buildings. Many of the exhibitors, instead of erecting the sort of stand to which we have been accustomed in England, have housed their exhibits in an architectural framing made to imitate houses, churches, colonnades, cloisters, &c., and they are so ingeniously made to imitate stone by colouring the plaster and imitating its texture that, at first, one is almost deceived into thinking that they are real buildings. The deception reaches its height in the Rue des Nations and Vieux Paris, in which texture and the effects of age are so well imitated that it is only the surroundings which strike a discordant note and make one certain that it is but an imitation—in fact, the imitation of ancient buildings in plaster has become a fine art, and if the reproach may be thrown at it that it is but the art of the theatre *in excelsis*, after all the greater part of the Exhibition is on the same footing, so that it is quite in keeping. Notwithstanding, the general effect of the white buildings, with their modelled decoration recalling the bride cake, is most attractive, lighted by the brilliant sun, which throws such beautiful reflections into the blue shadows, and relieved with touches of pure colour here and there, while against the evening sky the buildings show almost like fairy palaces built of opal or mother-of-pearl; a fairy dream, if one could shut one's ears to the Batel of human sounds and the snorts and groans of the motor-cars, the omnibuses and the steam trams, or rather street railways, for there are often three or four carriages of two storeys in the trains. The most important erections are the Grand Palais, the Petit Palais, and the Pont Alexandre III., which are intended to be permanent. The unsatisfactory thing about the great palace is the appearance of the roof above the colonnade, making it evident that this fine row of columns with its effective angle pavilions and imposing central portico is but a screen to hide the real construction. The interior is exceedingly fine and spacious, and quite simply constructional, the large girders sweeping across the vast space with something

THE ARCH OF CONSTANTINE.

of the grandeur of the curves of the lowest stage of the Eiffel Tower. The colour, too, is exceedingly pleasant, and the lighting of the miles of galleries is on the whole well managed, a few dark places being left in which to hide some of the bogies which seem to always turn up in picture exhibitions. The most successful of the foreign galleries in point of decoration are those of Germany and Austria. The latter country is rather too much bitten by L'Art Nouveau to be quite successful in design, nor is Germany altogether free of the taint, but both in the Court in the right wing of the Invalides Palace and here in the section of Fine Arts this country may be congratulated on the imposing arrangements which she has adopted. The gem of the palace, however, is the oval hall and great stairs which rise from it to right and left at the entrance from the Avenue d'Antin. It gives one an impression of rococo, though a great deal of the modelled detail is supposed to be of natural forms, and the projection of the ornament does not appear too great, as is the case with a great deal of that used in different parts of the Exhibition, which is partly owing to the knowing use of green glass to subdue the light from above. Steps rise from the rotunda to the level from which the stairs start, and a gallery runs round on that level except at the entrance, balustraded in front of the corner recesses, and with grey granite pillars supporting the back wall opposite the entrance and the stairs. Another gallery runs right round above, with a railing painted green and picked out with gold. The pilasters all round are filled in with polished yellow-green marble, upon which are placed ornaments of plaster gilded, the whole effect being very harmonious, whether viewed from the upper floor looking across from one staircase to another, in which case the lower and greener tone contrasts pleasantly with the

below. The other side has a grand entrance of eight coupled columns, and pavilions at the angles; between stretches a range of fourteen columns and two pilasters on each side, divided by seated figures supposed to represent different styles of art—those on the right are the best, but none are very successful. The grand entrance, however, has four standing figures in front of the coupled columns, only one of which is not positively offensive. Beneath are ovals with masks above them, and to judge from the expressions of disgust and disapproval on some of their faces they or their sculptors are of the same opinion. The larger pyramidal groups on each side are better and really serve to decorate the building. The frieze here is of mosaic representing the great epochs of art, and is not so successful as that on the other side. The columns are fluted and rather frittered with foliage which fills the flutings for a good

part of their length, but on the whole it is a fine building, upon which the architect, M. Deglane, may be congratulated.

The Petit Palais, which faces it at a considerable distance on the other side of the Avenue Nicholas II., is also a good building. It has a colonnade of 10 columns, not fluted, on each side of a projecting central doorway, and pavilions at the angles. Above the door, between it and the curved architrave which terminates the central mass, is sculpture of a flowery kind,

flowers, which overflows the margin with doubtful effect. Another point of treatment is open to criticism. The doors are gilded metal scroll work with glass in the upper part. The lower part of the framing is filled in with a large panel of onyx, a material which is surely quite unsuitable for such a position. The architect, M. Girault, has been criticised for the arrangement of the plan, but he may certainly be congratulated upon his building as a whole, and especially on the clever way in which he has managed the crowning feature of the central dome. Eight gilt caryatid terms support a very projecting roof, slightly recessed between each. A gilt vase stands above each caryatid and another larger one on top of a curved pyramid above.

(To be continued.)

STATUE OF THE DYING GLADIATOR.

other lighter divisions, giving accent and variety to the vista, or looking through the grey columns on the lower floor across the lower level, peopled with statues, to the stairs or the recessed balustraded bays, flanked by the golden and green pilasters on each side. The creator of this beautiful construction is a M. Thomas. Another picturesque effect may be seen from the corners of the picture gallery on the ground floor of the front part of the palace, where the effect of light and shade, and the white statues lighted from above and relieved against green shrubs, combine most attractively.

The façade towards the Avenue d'Antin has a monumental central gateway flanked by bronze equestrian groups. A range of freely treated Ionic columns spreads to each side in couplets, terminating and commencing with a solid space on which is a relief. At each end a figure in the round finishes the composition. Beneath the arcade, above the windows, is a frieze modelled in relief and coloured with pottery glazes representing the history of art. The columns stand upon a surbase pierced with simple windows, and by each side of the great door are reliefs of lions harnessed with flowers and controlled by Amorini. Above the door beneath the great arch is a pretty reclining female figure, and the summit is crowned with a bronze group consisting of various figures with Apollo in the centre, which makes one feel uneasy about its stability when one looks up from

and at the top of the piers which flank it are two groups which fill the corners, and include in each case a flying female figure with disproportionately long legs. Other groups are on pedestals in advance, flanking the steps to the central doorway, and are good, but in them one feels the presence of the model rather too much. Beneath the arcade above the windows are pretty reliefs of Amorini working at various crafts, and reclining female figures, alternately. The interior contains spacious and lofty galleries, arranged round a charming semi-circular court with a very graceful colonnade, ornamented with garlands between the columns of gilded metal. In the garden within are several small basins lined with mosaic of blue and gold, representing water-lily

STATUE OF ST. CECILIA.

COLOUR IN ARCHITECTURE.

By A. TROYTE GRIFFITH.

(Concluded from page 441, No. CCLXXXIV.)

III.—The Use and Value of Colour in Modern Architecture.

THE decorative use of colour has now been followed through the most important architectural styles, from the hieroglyphics and picture histories of Egypt and the enamelled friezes of Persia to the balanced unity of all the arts in the Athens of Pericles; the decay of the Roman and Byzantine Em-

sistent styles of decoration independent of the use of natural forms. These nations have, however, had little direct influence on European art, and their works may be admired and studied as examples, but not as precedents. That the religion of the Arab has rejected the human figure as a motive for design is no sufficient reason that the traditions of two thousand years should be relinquished by Christians.

That painting actually does occupy the leading position among the arts at the present day it is impossible to deny. And it must be confessed that this predominance has been legitimately won. Compare the logical progress of painting from the fourteenth century with the

logical equality between the advances of science and art. If, in the same period, improvements in construction have not affected the very foundations of architecture, yet, to give only one example, the alterations in the manufacture and use of iron must be considered of prime importance; and the age that can create such structures as the Forth Bridge or St. Pancras Station has seen no iron building of any artistic importance.

It is not necessary to dwell on this shortcoming of modern architecture, as another reason exists for the predominance of painting. Formerly architecture was the art of the many, painting of the few. Now the position is reversed; in painting the individual artist can more readily express himself, the nation as a whole more easily satisfy its artistic wants. This is the meaning of the numerous picture exhibitions, the overcrowded galleries, the schools of art in every town, the enormous circulation of illustrated newspapers. Formerly the people were the makers of the town-hall and the cathedral, and could appreciate conquered difficulties and ideal beauties. Now architecture is a kind of recondite mystery, no longer the art of the people, but the direct production of the brain of the architect, filtered through the hands of unsympathetic workers.

As painting occupies such an important position in the minds of men, there is the more reason that it should give what help it can to the decoration of buildings. Painting applied to architecture can take two forms—either it is subordinate to architecture and forms part of the general effect, or it disregards architecture and remains merely the easel picture on the walls of a building. Though the futility of decorating a building with modern easel pictures is of course evident, the reason requires investigation. For though we may except the modern paintings that aim mainly at presenting the truths of Nature, we shall find that even the more decorative are really unsuitable for mural decoration on any extensive scale. A picture painted in accordance with the laws of linear and aerial perspective, and with due regard to tones and values, has its own very definite requirements, which are hopelessly antagonistic to those of mural decoration. To see such a picture with comfort, the spectator must place himself opposite the centre of the panel near the horizon line, at the right distance both for the perspective effect and the handling of the paint. He must, in fact, isolate himself at some particular point in the building, for elsewhere the panel will tell simply as a mass of colour, not as a picture. On vaults and ceilings even greater difficulties occur: at some positions the figures will be seen upside down, and the effect becomes ridiculous. Correggio (in the dome of Parma Cathedral) and Tiepolo (at Würzburg and elsewhere) not unfrequently endeavoured to solve the problem by treating the figures as if they were actually on the ceiling itself, floating in clouds, foreshortened from the soles of the feet. This was perhaps successful from the painter's one point of view, but from any other the perspective effect is destroyed. Then again the difficulty arises of the treatment of subsidiary ornaments. If the decorative adjuncts are painted in flat tones they will inevitably prove out of harmony with the panels in light and shade, and the alternative of modelling up the decorations to suit the pictures is equally displeasing. As Viollet le Duc remarks, "In the middle ages, monumental pictures did not look as if surrounded with strips of painted paper. Modern wall paintings are really pictures fastened to walls, and surrounded by a frame which, instead of isolating them like an insignificant band of gilding, nullifies and destroys the effect."

But while modern painting depends on conventions that are inconsistent with architectural decoration, mural painting is based on others no less difficult to reconcile with contemporary ideas of art. In the first place mural painting must be beautiful, for the object of mural painting is mainly to decorate the wall, and decoration without beauty is a contradiction in terms. This may seem an unnecessary condition, but much modern painting is really not beautiful at all, in any ordinary sense of the word, as the work of Degas and

THE LAOCOON STATUE.

pires lead to the everchanging splendours of mediæval architecture, in turn to perish at the sudden outburst of artistic enthusiasm known as the Renaissance. Since this period, the modern developments of painting, and the consequent separation from architecture, have resulted in a certain identification of colour with paint. This is at present probably unavoidable in the highest forms of art, as glass, mosaic and other constructional materials are practically unsuited for the expression of the subtleties of the human form. And though ornamentation of a conventional nature may afford an intellectual and refined system of decoration, yet for Europeans the representation of the human figure will alone impart the highest dignity to architecture. It is true that the Arabs and other Oriental races, hampered by the ordinances of the Koran, evolved con-

development of architecture during the same period. In painting, every advance in science and technique has led directly to new forms of artistic expression. The substitution of fresco for mosaic, by Cimabue and Giotto, was quickly followed by the assertion of the painter's individuality, in place of the traditional use of Byzantine archaisms. The invention of perspective, by Alberti, was soon applied to the foreshortening of the human figure, in the unsurpassable drawing of the Sistine frescoes; the closer observation of light and shade by the Florentines was at once utilised in the perfected chiaroscuro of Correggio. The invention of slow-drying oils by the Van Eycks enabled the accurate study of natural effects by Velasquez and more modern painters. But the warmest admirer of the architecture of modern England can hardly claim such a

other very clever painters clearly shows. Secondly, mural painting must be harmonious, not only in itself but also in relation to its surroundings. For this reason mural painting must not ignore the existence but rather accentuate the construction of the building; that effect of solidity, essential to monumental architecture, must not be destroyed by any appearance of a hole cut in the wall, or by one portion of the painting starting into greater prominence than another. The interest of the design must not be over concentrated, but the painting should tell over the whole surface. From these two main principles of beauty and harmony many deductions may be made, such as the need for simplicity both of general design and of individual modelling, the objection to the use of landscape, or to dark and obscure subjects, and the importance of a dead surface. To such restrictions as these all successful decoration of whatever period has been subject. But that a modern school of painting will again endure the thralldom of such conventions it is impossible to imagine.

The division of painting into two styles, of decorative painting and pictorial painting, is an impossibility. It is an unfortunate fact that much decorative painting is not pictorial, and much pictorial painting is not decorative. But all painting is not art, any more than all building is architecture. Engineering and architecture exist side by side to the detriment of both, and two styles of painting existing simultaneously in the same country can only stultify and injure each other. The truth is that all national schools of painting have been as pictorial as the knowledge of the painters permitted, and as decorative as the circumstance of the case required. Michelangelo may be less pictorial than Rembrandt, but "The Night Watch" is as sufficiently decorative for its purpose as "The Last Judgment." The one had to decorate a panel in a Flemish town-hall, the other the end wall of an Italian church. We can appreciate and enjoy the work of Giotto and his followers, because it represents the attainments and aspirations of the fourteenth century. But work executed on such principles in the nineteenth century will always have a sense of incompleteness, an inability to represent modern ideals and modern knowledge. Occasionally some great painter may subordinate himself to the requirements of architecture, but never again a national school of painters. It is impossible to ignore the art of *Painting*.

We have now arrived at these conclusions—that architecture should make use of colour decorations, and especially the representation of the human figure, as it has in previous ages; that painting must be modern; and that modern painting will not decorate. What, then, is the solution of this dilemma? In the first place we must renounce great schemes of decorative figure compositions, though we may still hang a great picture—the expression is used advisedly—in the place of honour, the important point on which interest will be concentrated. The reredos of a church, or the wall of a court of justice, may still be dignified by the finest pictures, but no longer can wall and vault of monumental interiors be covered with the works of contemporary painters. Such interiors as do not pretend to unity of architectural effect on a large scale, as the walls of apsidal chapels and baptisteries, or the corridors and galleries of public buildings, will still afford opportunity for the painter to display his art. It is doubtful whether the Pantheon of Paris gains or loses by the pictures on the walls; the commemorative value of the building is increased, but the general effect is probably diminished. Only an architect could notice or describe the architecture of the Sistine Chapel; it happens to be a building of minor architectural significance, apart from the decorations, but such decorations would have crushed the greatest monument of the Renaissance. We may compare the practice of the Greeks; the single statue of Athena Parthenos or the Olympian Zeus, supported perhaps by subordinate decorative works, was sufficient for the interior, but extended series of sculptures were confined to the exteriors of temples, where only a limited portion could be seen at one time.

But though in monumental interiors paint-

ing must remain as panel painting, colour will not thereby be confined to a few important points; rather should the whole building form one harmonious scheme of colour, worthy to receive the masterpieces of modern art. With some great picture to vocalise the speechless forms of architecture, sufficient emphasis for the remainder of the building may be obtained from harmonies and contrasts of colour, symbolic and conventional ornament, inscriptions, and all the thousand devices of the decorative painter. We have already seen that colour should be added to architectural forms not as an after-thought but as an essential part of an original scheme. The power of colour is too great to leave anything to chance. In the words of Viollet le Duc, "C'est une fée qui prodigue le bien ou le mal, mais qui ne demeure jamais indifférente. D'un coup de pinceau elle détruit une œuvre savamment conçue, mais aussi d'un humble édifice elle fait une œuvre pleine d'attraits, d'une salle froide et nue un lieu plaisant où l'on aime à rêver et dont on garde un souvenir ineffaçable."

But though the very ease of handling paint has led to peculiar difficulties in its use as a decorative agent, other materials remain to the hand of the architect. Coloured sculpture and bas-relief, gesso, sgraffito, mosaic, marble inlay, marble panelling, tile work, faience, enamel, and stained glass will compensate for the loss of figure painting. Moreover, these materials are in themselves more beautiful than paint. Oil paint, especially in flat tints, is not a substance of surpassing beauty. Rather does its excellence exist in the facilities for refinements of varying tone and tint, in the application of combinations of colour to other materials. Nothing is more difficult in the way of decoration than to harmonise flat tints of coloured paint. The elaborate theories of Chevreul or the Draconian laws of Owen Jones will not give the softening touch so readily lent by the shades and shadows of coloured sculpture, the glaze of faience, or the network of mosaic joints.

Again, conventions that now seem absurd in painting are in more constructional media (such as glass or mosaic) not only necessary but the very essence of a proper artistic treatment. And provided the human figure be represented with the limitations imposed by the material, the cultivated eye will feel no loss from the absence of that "effect" universally associated with modern painting. This, however, must be remembered, that paint in a sense decorates construction, while mosaic and such materials are themselves the actual construction. In other words, colour rightly applied in the form of paint may intensify and elucidate the meaning of the architecture, but if added in the form of stained glass, mosaic, or other constructional methods, not contemplated in the original design, the whole character of the building will thereby be changed.

For instance, take the case of stained glass: no coloured material has had a greater influence on architecture, as has been shown in the account of mediæval decoration. As the majority of modern churches are more or less close reproductions of Gothic buildings designed for the express purpose of exhibiting stained glass, such churches will probably be improved by the insertion of stained glass windows, though even so the colour treatment must be systematic; better the cold stone and white light throughout than glaring spots of colour isolated among bare walls and unpainted roofs. But to introduce stained glass into buildings decorated with pictures or frescoes, or in those rare cases in which a well-devised system of lighting has been arranged by the architect, is a barbarism that cannot be too strongly denounced. Such a building as Professor Cockerell's fine church in Regent Street, where every window plays a part in the general scheme, would be ruined by the introduction of coloured light. And it must always be remembered that the great height of ancient windows will often mingle the many-coloured light into one mellowing glow before reaching the eye of the spectator. Modern glass is too often inserted in aisle windows where the glaring light may, indeed, permit the perusal of the donor's name, but will effectually accentuate every individual coloured quarry.

Again, mosaic—that gorgeous art of a decadent empire, and a nascent civilisation—was well suited to the crude vigour of Byzantine or Romanesque building. But in St. Mark's at Venice, or the cathedral of Monreale, where this form of decoration has been worked out systematically, the effect is rather due to the mosaic than to the well-ordered expression of construction or the beauty of line and mass. As pointed out by V. le Duc, the innumerable little joints and glittering reflections that endow mosaic with such a bizarre charm of its own distract the eye from the colder beauties of architectural design. This is not advanced as an argument against mosaic, but against the introduction of this form of colour decoration into buildings designed on different principles. Glass mosaics have often been used as inlays in marble and porphyry slabs, on pulpits, tombs, or pavements, as the shrine of Edward the Confessor and the Sanctuary pavement at Westminster Abbey. This has given many delightful effects, though it has led to a mistaken use of mosaic in modern times, in subjects of too much detail and insufficient mass. The Byzantine artists almost invariably panelled the lower portions of their buildings with marble slabs, as mosaic, like stained glass, is most successful when seen in broad masses at a sufficient distance to generalise the individual tesserae.

Coloured bas-relief is another method of architectural decoration in which interesting experiments have recently been made. The colouring of low relief is only a step on the way to coloured sculpture in high relief, the supreme achievement of the Hellenic mind, in the arts of form. The principles that should govern the colouring of sculpture were somewhat fully discussed under the heading of Hellenic decoration. Coloured bas-relief, however, occupies an intermediate position between painting and sculpture, and requires a distinct treatment of its own, as the modelling will tell not only as form but also as masses of colour, and to the colour effect the modelling must be subordinated. Fascinating possibilities are opened up by the reintroduction of this ancient form of decoration; difficulties of perspective, the foreshortening of figures, the treatment of backgrounds, afford technical problems of an interest that may lead to results of the highest artistic importance. Coloured bas-relief and sculpture undoubtedly harmonize with polychromatic decoration and painted mouldings, as well as figure painting, and better than stained glass or mosaic; it does not demand the realistic treatment of the one, and is exempt from the technical difficulties of the others, in the representation of the human figure. The quality of ideal dignity as well as the charm of human interest can best be imparted to architecture by series of bas-reliefs or monumental statues. A Neo-Hellenic school of sculpture painters may perhaps be destined to reunite the arts of painting and sculpture with architecture.

The latter part of this essay has been chiefly concerned with interior colour decoration, though the same principles will apply to exteriors, with the proviso already stated, that the stability and convenience of the structure must not be injuriously affected. This condition is evidently of considerable importance in England, as a climate that requires the continual repainting of external woodwork is clearly unsuited to the polychromatic painted decoration of Greece or Egypt, or even the more limited system of mediæval France. The great cathedrals of the north of France were certainly not painted all over. But the more sheltered and important features, such as the mouldings and sculpture of porches and niches, or the leadwork of *flèches* and roof crests, were emphasised with colour and gilding, in a setting of sombre stone. Even this amount of painting would be out of place in England, where colouring of a constructional nature can alone be considered of sufficient permanence to merit consideration as an element of architectural effect.

The colour treatment of exteriors, unlike interiors, cannot be regarded solely in relation to itself, but must be modified to suit the peculiar surroundings of each example. In the country, isolated buildings have the advantage

of a natural background, changing only with the seasons of the year. To ensure a certain degree of harmony with the general landscape, the most obvious plan is to use the building materials of the district: stone and slate among the hills, brick and tile in clay pastures, thatch and timber in woodlands. But whatever the method of construction, the building should not be cut up into irritating little stripes and patches, but should tell as a few simple masses of colour. Like Nature, the architect must work with a full brush.

In towns greater difficulties occur, both in securing harmony with the surroundings and in obtaining materials of sufficient permanence. The natural polychromy of building stones and bricks is soon destroyed in the smoky atmosphere of modern cities, and nothing but glass mosaic or glazed brick will retain its original character. The permanent colour treatment of buildings might perhaps at first open the way to greater atrocities of colour than those that now exist. So long as adjoining owners confine themselves to inconspicuous shades of brown and yellow stucco, the evil soon rights itself, even though the dividing line of paint be carried down the centre of a pilaster. But in the unchanging medium of faience some attempt would have to be made at a neighbourly harmony. There is no doubt that the fine effect of such streets as Regent Street depends mainly on the uniformity of colour and material. And if it were possible to secure a similar ground colour for a whole street or square a very important step would be made towards harmony of effect. It need not be feared that a uniformity of ground colour would cause undue monotony. In the country the background is nearly always monotonous, and in the town the houses form a background for each other. Moreover, the details and ornamentation of each house would afford ample scope for originality and variety of treatment on the part of the individual designer.

These notes on the practical use of colour may seem meagre and insufficient, in comparison with the greater space devoted to the philosophical and historical sides of the subject. It is, however, impossible within the limits of these articles to do more than allude to the different media that can lend colour to a building. Each in itself a lifelong study, could only receive justice from a master of the craft, and it would be useless to repeat at second hand the personal experience and advice of other artists. And although it is hoped that some information may have been given about the various uses of colour in different periods of art, the discussion has been confined as far as possible to the value of colour as an element of architectural design.

At the present time the great body of artists pay small regard to the thoughts and actions of workers in other forms of art. For although the actual products of men's minds and hands be marked as the work of the same time, yet, from the isolation of the workers themselves, they lack that spirit of unity so noticeable in the greatest periods. An extended use of colour in building would do much to draw together painters, sculptors, and architects, and to interest the greater public in works of an ideal nature. In the words of a fine writer: "There come, from time to time, eras of more favourable conditions in which the thoughts of men draw nearer together than is their wont, and the many interests of the intellectual world combine in one complete type of general culture. Then men do not live in isolation, but breathe a common air, and catch light and heat from each other's thoughts."

Deptford Art Exhibition.—The committee responsible for the organisation of the projected art exhibition at Deptford are appealing for funds to enable them to meet the cost of the undertaking. Already a large number of works of art possessing particular interest for all dwellers in Deptford and Greenwich have been promised by collectors and artists. But the cost of insuring the many valuable pictures which have been lent, and the expense of working the show, must be met by voluntary subscriptions, and the committee are naturally anxious to secure sufficient support to safeguard them against possible loss.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Bricks and Stones in North Durham.

LIVERPOOL.—AJAX writes: "What are the bricks, red bricks and stone, most easily procured, and of a good nature, in the neighbourhood of the Tyne Ports and North Durham?"

Prudham is the best quarry for good sandstone. Windy Nook, Blaydon, Kenton and Burradon are all fairly good, but the two latter are not so good now as they were some years ago. Heworth is a good quarry for steps and thresholds, being a hard stone. Some of the best bricks come from Blaydon, Shincliffe, Sherburn, Pensher, Birtley and Choppington. The Blaydon bricks are chiefly white or buff. The Pensher are used for pressed bricks, and the others are common. H. C. C.

Party Wall.

GREAT YARMOUTH.—DOUBTFUL writes: "A. contracts with B. to build some houses in a terrace; C. owns the land upon each side of B's plot, but does not build till B's houses are completed. The clauses in the agreement read:—'The contractor to build and complete the said seven houses generally in accordance with the plan drawn by X.Y.Z. and the stipulations of the vendor. . . . Generally the houses are to be built as those built and being built upon the same estate and as usually built in houses of this class.' The stipulation of the vendor is:—'All division walls are to be party walls, and the purchaser of each site is to bear half the cost of erecting such party walls.' The plan drawn by X.Y.Z. shows party wall to full thickness. A. upon commencing to build gave notice to C. that he would charge him with half the cost of party walls. Now seeing that the half of party wall is not part of B's houses, and also noting the terms of agreement, &c., will you please advise if B. has any claim or right to the amount paid by C. to A.?"

I do not think he has. When A. contracted to build the houses he did so, apparently, on the understanding that he was to look to C. for payment of one-half of the cost of erecting the two party walls, and therefore estimated his price simply with reference to the cost of so much of the building as would be erected on the ground which belonged to B. If B. could get back from A. what the latter received from C. he would be getting a double advantage, namely, first getting the houses built cheaper by the half cost of the two party walls, and secondly getting from A. what A. got from C. as C.'s contribution towards building them. Of course, if A.'s tender was simply based on the cost of erecting the houses, on a site which exceeded B.'s property by the width of half of each party wall, without any reference to the fact that C. was bound to contribute one-half the expense of these walls, then A. has got paid twice over for the portions of them that are erected on C.'s plots, and B. would be entitled to credit for the amount received by B. from C. It is hard to tell which of these alternatives is correct: but having regard to the fact that the contract between A. and B. distinctly refers to the "stipulations of the vendor" it would seem that A. must have taken into consideration, when tendering, the fact that C. was bound to bear half the expense of the party walls, and that C. would—as he thought—be bound to pay him such sum as fairly represented the one-half of the cost of erecting them. H. P. B.

Rights of Light.

GREAT YARMOUTH.—DOUBTFUL writes:—"A. and B. are neighbours living in a narrow thoroughfare, each keeping a shop. Two years ago A. put bays to each floor above his shop.

B. has now at the end of his own premises, upon the lead flat, erected an upright signboard reaching to top of A.'s window. Has A. any remedy?"

I do not understand the position. There is no explanation of what "the lead flat" is. B. has a perfect right as against A. to erect anything he likes on his own premises unless such structure interferes with the access of light to an ancient window. H. P. B.

Payment for Repairs.

KENT.—ANXIOUS writes: "I have just finished a contract for £1,000 for alteration to a workhouse administrative block. I had several provisional items in the specification, one being £50 for extras. A dispute has now occurred with the architect. The specification states 'the whole of the ceilings throughout to be repaired to the entire satisfaction of the architect.' When I came to some of these ceilings they were found to be very bad, and the architect told me to take them down and re-lath where necessary and put up new, which I have done. I have now sent him in my account for new, and he simply runs his pen through the items, and returns to me, with a final certificate for £46 18s. 9d., my account being for £90. I may say that he gave me a good deal more work than was provided for in the specification, and he has signed the items in a diary that I kept for that purpose. The Guardians say they cannot pay without another certificate. Would it be any good for me to appeal to the Local Government Board? There was no properly drawn up contract besides signing the plan and specification."

I think that the taking down and re-lathing the ceilings or parts of ceilings was covered by the clause in the specification which your correspondent quotes, and that the cost of doing so cannot be recovered as an extra. An appeal to the Local Government Board would be useless. H. P. B.

Views and Reviews.

English Windows for an American Church.

Mr. Henry Holiday has recently completed two large stained-glass windows for the church of the Holy Trinity, New York, for the chancel of which he has already made seven windows. The two which he was showing to his friends the other day are to face each other at the ends of the transepts. The subjects are respectively "The Crucifixion" and "The Ascension," and the windows are of five lights of equal height with tracery above. In the former the centre light contains the figure of Christ on the Cross, and the outside lights are filled with the crosses of the two thieves, below which, on the right, are the soldiers casting lots and dividing the clothes, while on the left are the faithful women and St. John; behind these groups in lights two and five are soldiers on horseback, and above are mourning angels. Across the whole window runs a band of grey towers (the city of Jerusalem) and horizontal bars of clouds, between which the golden sky shows; these bars a little higher become the floor upon which the angels stand. In the tracery are little subjects from the Resurrection, the risen Christ, the Entombment, the Angel and the Women, &c. The colouring of the choir of angels is very happy—green-blues, purple-blues and purple, with a few wings and nimbi ruby and pale purple.

The centre light of the "Ascension" window is filled by the figure of Christ clothed in pale green with a splendid ruby robe and an aureole of varied blues and ruby on yellow. In the next lights on each side, on a lower level, stand the "two young men in white apparel," and the Apostles and other Disciples fill the lower part of each light, the Virgin and St. John being in the centre. Above, in the two external lights, is a choir of rejoicing angels, which also extends over the upper part of the second and fourth. These are not quite so successful as the mourning angels, either in colour or design, but much of the general colour is quite splendid, particularly in the deep rubies and rubies on

yellow. The greens also are frequently very fine, recourse having been had to plating to obtain them. The tracery contains small subjects from the Ascension and Pentecost.

Mr. Holiday has been careful to complete the design of each light in itself, while so arranging the figures in them that each bears a relation to the others, thus avoiding the appearance of the mullions being superposed on the design, which is frequently so disturbing in windows in which the subject extends over several lights. The right way, of course, is for the spaces given to be pleasantly filled so that one is not tempted to wish the mullions away, and Mr. Holiday may fairly be congratulated on the success of his design in this matter, as well as on the splendour of his colouring. A. W.

Correspondence.

The Royal Architectural Museum.

To the Editor of THE BUILDERS' JOURNAL.
7 PALL MALL, S.W.

SIR,—In February-March last you published some letters from Mr. Adams and myself concerning the state of the above museum. In my first letter I called attention to the want of a catalogue, the unsatisfactory state of the museum copy, and the general state of the museum itself. In reply, Mr. Adams, the hon. secretary, stated that a new catalogue would be issued shortly, it being then in preparation. He also remarked that he failed to find my name among the list of subscribers to the museum. I wrote to Mr. Adams saying that I should be glad to receive a copy of the last annual report, with a list of the subscribers, adding that I should only be too glad to become one myself. The fact that my request for a report or list of subscribers was utterly futile will perhaps show why subscriptions are not forthcoming. It is evident that the Council are not making any serious efforts to get subscriptions or to make the existence of the museum known, and it seems very probable that unless something is done soon the museum will become entirely absorbed in the Westminster School of Art, and thus lose its character of a *Museum of Gothic* altogether. It seems to be the wish of the Council to turn this institution into a sort of Arts and Crafts School, and at their annual meeting at the museum held last Friday week this was the chief topic. The maintenance of the museum as a museum was hardly mentioned, and the question of a catalogue did not come up at all. It seems a pity that the Council cannot see their way to take steps to set the museum on a basis of its own apart from any School of Art or Arts and Crafts. At any rate, all who are interested in the welfare of Gothic will look to Mr. Emerson, the President of the Royal Institute of British Architects and the new President of the Museum, to try and restore it to its proper dignity and relation with the Institute and the profession.

A School of Art is one thing and a museum quite another, and if the Council devote their energies to the first, as they have done now for so long, they will be neglecting the trust that has devolved upon them from the founders of the museum.—Yours, &c., MAX JUDGE.

Ham Hill Stone.

To the Editor of THE BUILDERS' JOURNAL.
NORTON, STOKE-UNDER-HAM, SOMERSET.

SIR,—On page 428 of your issue of July 11th your correspondent replying to an inquiry about Devonshire building stones makes some remarks as to the delay experienced in obtaining Ham Hill stone. Probably your correspondent refers to the period previous to the year 1888, when the various Ham Hill stone businesses were amalgamated into the company now working the quarries. Having erected by far the best and most speedy stone-working plant in the south or west of England, this company can invariably guarantee prompt delivery of all orders for wrought stone to any required details and can refer intending customers to the leading architects of the day under whom works have been executed.—Yours, &c.,

For the Ham Hill and Doulting Stone Co.,
J. STAPLE, Managing Partner.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read with great interest the letters which have appeared in your valuable paper lately on this subject. I must congratulate the gentleman who has opened this discussion in your paper, for his is exactly my own idea, and also the idea of all those in the town in which I stay, both assistants and apprentices. I agree with "Vigilans" that there should be a society for architects' assistants in every town in three classes, *a*, *b* and *c*, the subscription to depend on the class belonged to. I would like, if some gentlemen would make a start, to open such a society. I am sure every assistant would join it. I should be very pleased to do anything in my power to help it on.—Yours, &c., ARCHITECT'S ASSISTANT.

NEWPORT, MON.

SIR,—I think it is quite time that this subject was called attention to. No one can take exception to the facts stated by "Disgusted," and few I think can fail to agree with him. If we take the premium into consideration (which is not covered by the first few years' earnings) a young architect has, when he leaves school, a period of seven or eight years, on the average, to look forward to in which he earns absolutely nothing—a cheerful prospect. If he studies outside his office work his hours are indeed long, and yet how can he gain the necessary qualifications demanded by most employers without it.

Union is strength, and this state of affairs can only be remedied by a united effort on the part of the assistants throughout the kingdom.—Yours, &c., A READER.

SIR,—I have read the letters on the above subject in your valuable paper with much interest and I would like to say that the opinions expressed in them are exactly in accordance with my own ideas, although with regard to what "Hopeful" (see last week's issue, p. 463) says in his letter about the assistants themselves being to blame for not asking enough I may say that if an apprentice newly out of his articles were to ask when applying for a situation a salary of from 25s. to 30s. a week, he simply would not get it, so he would have to come down to 20s. or 23s. a week whether he wanted or not, and I think the same can be said of the head draughtsman and his salary also.

If a society for the improvement of assistants' salaries can be got up I would be very pleased to do everything in my power to help it on, and also try to get others to do so.—Yours, &c., JUNIOR.

EXETER.

SIR,—Architects' assistants are not always paid at so low a ratio, as your correspondents seem to assume. In my own office I have—and have had for several years—an architect's assistant (a draughtsman)—a young fellow who receives £2 a week. If he makes overtime he is paid for it at the same rate. Now this is in a small West of England city, where few ordinary clerks in business establishments receive more than 25s. a week.

I had occasion recently to advertise for an additional assistant of the kind, but of all the replies I received—perhaps a dozen—the lowest "screw" asked by any applicant was £2 a week.

The rate of wages here for all members of the building trade is under 30s. a week.—Yours, &c., AN ART WORKER.

Mission Church for Naauwpoort.

The important railway camp at this junction on the line between Cape Town and the north has become quite familiar to English readers within the last few months. Apart from the circumstances brought about by the war, the place was growing fast and the population rapidly increasing. A good schoolhouse and an institute had been provided, but no place of worship or residence for a clergyman. Funds are appealed for to erect first a small clergy house for the agent already at work, and afterwards a modest church. Only £200 are needed for the first and £1,000 for the second. Miss Elise Astley, 3 Halkin Place, will gladly receive contributions.

BUILDING TRADES' GIFT TO THE NATION.

MR. SACHS, the Chairman, announces that considerable progress has again been made this month with the Building Trades' Gift to the Nation regardless of the approaching holiday season. In the first place large contributions have this month been received from the provinces, for which Mr. T. F. Rider personally made the necessary arrangements. The collections in Birmingham from workmen already exceed £200; whilst in Walsall over £150 have been collected, in Leicester the amount has reached £170, and in Nottingham £100, &c. A "shilling" collection by the BUILDERS' JOURNAL has also reached £180, and one by the "British Clayworker" over £100, besides producing many gifts in kind. There have been numerous subscriptions from individuals and firms, the Clerk of Works' Association also sending £22, whilst small contributions from workmen aggregated £98. Numerous gifts in kind have also been presented in connection with the execution of the work. Regarding the progress of the buildings at Bisley, Messrs. George Trollope and Sons are carrying out the work with all possible speed, and the brickwork of two of the new Homes is already nearly completed. As far as contributions are concerned, it is now particularly requested that they may be in money rather than in kind, and all communications in this matter should be addressed to the Executive at 1 Waterloo Place, Pall Mall, S.W.

The following further contributions have been received at the offices of the Executive of the Gift:—

	£	s.	d.
The Nottingham Master Builders' Association (per Mr. W. G. Barton) ..	100	0	0

The Dean Cowie Memorial.—The scheme for the memorial of Dean Cowie in St. Lawrence Jewry has undergone some alteration. As the funds necessary to introduce the electric light into the church are not sufficient, it has been decided by the committee that a carved oak litany stool shall be placed in the church with a suitable inscription. Mr. G. H. Fellowes Prynne has been asked to design the stool.

WESTMINSTER IMPROVEMENT.

AT last week's meeting of the London County Council an urgency report was brought up by the Improvements Committee respecting the improvement scheme at Westminster which has recently been before a Committee of the House of Lords (see page 464 in our last week's issue). The Committee had found the preamble of the Bill proved, but did not approve of the suggested plans, although an alternative plan met with their sanction. If the improvement should be carried out in accordance with the decision of the Committee of the Lords the effect would be to add to the Victoria Tower Garden an area of about three-fourths of an acre, the greater part of which would otherwise have been available for recoupment. The line of the street would have a bend near the southern end of the present garden, with the result that, in approaching from the south, a finer view of the Houses of Parliament would be obtained, and, conversely, anyone going south from the Houses of Parliament would obtain a better view of any buildings to be erected upon the southern portion of the new street. The Victoria Tower Garden would be scarcely touched, and a fine row of some twelve trees would be preserved. The extent of the property to be compulsorily acquired was not altered, but land that would otherwise have been available for recoupment would now be added to the garden, and it was estimated that the selling value of this land would be about £60,000. As against this there was a small set-off in the engineering works, which would be somewhat less expensive, the estimated gain being about £4,000. Therefore, to carry out the new scheme would cost the Council about £56,000 more than the scheme embodied in the Bill. The Committee felt that the Council was in a difficult position; but nevertheless thought they should proceed. A report of the Parliamentary Committee on the same subject was taken with the urgency report, the recommendation being that the Council should not accept the alterations.

Mr. Cornwall, chairman of the Parliamentary Committee, said the Council's scheme had passed successfully through the House of Commons Committee, but now they were asked by a Committee of the Lords to accept a totally different scheme. There was no time to go into all the facts relating to a new improvement, and his committee proposed to drop the matter for the time being. The Improvements Committee had called a hurried meeting and brought an urgency report to the Council in favour of the Lords' amended scheme, and he submitted that this was not the way to conduct the business of the Council. There were a great many questions which the Council would have to consider before it could pledge itself to a new scheme. The Lords Committee seemed to have been influenced by the owners of property in Abingdon Street, but he thought the Council would not be affected in like manner. The Lords asked the Council to treat this as a national not as a municipal improvement. It would be a bad precedent for the Council to rush any improvement scheme in the way the Lords suggested, because future Bills of the Council would be opposed at the eleventh hour in the hope that the Council would give in rather than drop them. It was the duty of Parliament not to ask the Council to consider a new scheme but to accept or reject the one which the Council promoted.

Mr. Shaw-Lefevre moved as an amendment:—

"That the Council do proceed with the Bill subject to the Select Committee of the House of Lords agreeing that the new street from the southern end of Abingdon Street to Lambeth Bridge shall be carried out in general accordance with the route shown upon the plan approved by the Improvements Committee on June 7th, 1899, sanctioned by the Council on July 4th, 1899, including the widening of the northern end of Abingdon Street as already arranged."

He agreed that it was not wise to accept an alternative scheme from a Parliamentary Committee, but this was not really a new scheme,

as it had already been approved by the Council in June, 1899. He regretted that the House of Lords Committee had not accepted the Council's later scheme, but as they had accepted the first scheme he could not help thinking it would be very unwise for the Council to drop this improvement at the present time. Any delay would add to the cost enormously. In fact, the Council's valuer had stated emphatically that a year's delay would entail an additional charge of £100,000. It would be better, therefore, to incur now the £50,000 extra which the amended scheme involved than to permit any further delay to take place. This was one of the most important improvement schemes which had ever come before the Council—it was also one of the most popular—and he trusted that the Council would not place itself out of favour by dropping the scheme at the present time.

Mr. R. A. Robinson, who seconded, said the question of cost was the chief consideration, and he was convinced that the Council would lose heavily by refusing to go on with this scheme now.

Mr. McKinnon Wood opposed the amendment. He said they were asked to add three-quarters of an acre to the House of Lords' garden at a cost of nearly £60,000, and to secure a new approach to the Houses of Parliament. If this was to be a national improvement, as was stated, why was it not paid for out of national funds? He did not object to expend money in opening out the public buildings of London, but they must draw the line somewhere, and he was not prepared to spend another £60,000 on this improvement.

Dr. Napier could not accept Mr. Wood's leadership in this instance, and he could not help thinking that it would have been better had he raised his objections when the scheme first came before the Council. Unless this improvement were at once proceeded with, it was not unlikely that the syndicate which had formerly proposed to deal with it would again be formed.

Mr. Burns agreed that Mr. Wood's opposition ought to have been raised two years ago, and he considered it was hardly worthy of the leader of the Progressive Party to raise the cry of economy now. It was not the House of Lords' garden that would be enlarged, but a garden that was open to the people of London. He welcomed the Lords taking an interest in the enlargement and preservation of open spaces. The amended scheme was better than the old one, and he believed that the additional cost would be more than compensated for by the additional benefits.

Dr. Longstaff said it was utter nonsense to speak of the open space as the garden of the House of Lords, inasmuch as the place was dedicated to the use of the public for ever. The new scheme made it possible for the Council to erect its new county hall in the neighbourhood if it so desired.

Mr. Benn thought that the additional cost entailed by the amended scheme ought to be met by the Government, and failing that he was not prepared to support it. He ridiculed the idea that it would be possible to build a county hall in the locality. Imagine the House of Lords and the County Council facing each other.

On a division there voted:—For the amendment, 64; against the amendment, 43.

Mr. McKinnon Wood then proposed as an addition to the amendment a clause "providing that the Government is prepared to contribute the cost of the addition to the garden."

Mr. Benn formally seconded.

Mr. Shaw-Lefevre explained that there was no time to negotiate for a contribution, even though it were possible to secure one, as the Council's decision must be given to the House of Lords Committee next day. He would take that opportunity of informing the Council that the Chancellor of the Exchequer had several times told him that the Government could not under any circumstances contribute to the cost.

Another division was taken, when the proposed addition was defeated by 61 votes to 47.

After further discussion Mr. Shaw-Lefevre's amendment was put as a substantive motion, and carried by 52 to 40.

The Select Committee of the House of Lords again had the subject before them last Thurs-

day in considering the clauses of the Bill of the London County Council authorising various London improvements, the most important of which is the construction of a new road from the Houses of Parliament to Lambeth Bridge, the extension of the embankment wall and gardens from the Victoria Tower Garden to Lambeth Bridge, and the clearing and rebuilding of the properties on the western side of the new road.

Mr. G. J. Talbot said that, before their lordships went through the clauses, he would ask leave to state the attitude of the London County Council towards the Westminster Improvement in view of the decision of the committee, which, by transferring a piece of land to the eastern side of the street, where it would have to be added to the gardens and so would not be valuable for the purposes of the Council, had involved some addition to the net cost of the work. The Chairman: £65,000. Mr. Talbot: Yes. But that cost, whatever it might be, had been thrown on the County Council in order that the work might be a more satisfactory national improvement. The Chairman: The phrase "national improvement" has been attributed to me, but I was not the author of it. Mr. Talbot said there was a portion of the scheme which was of a London character, but the improvement of the approaches to the Houses of Parliament was of a national character. The view of the County Council, whether right or wrong, was that the enhanced cost occasioned by the modification of the scheme in the interests of the national part of it ought to be borne by the Government. The County Council, however, were sensible that, if the scheme were to be carried out at all, it must be carried out without delay, as there was going on all over the area affected a substitution for poor property of expensive houses and works—a process that would be greatly accelerated should further delay occur. The Council, in proceeding with the modified scheme, desired to make it plain that, in doing so, they did not abandon or prejudice their right to approach and press on the Government the contention that in equity the national Exchequer should make a further contribution in respect to the additional cost imposed on the Council in regard to the national as distinct from the metropolitan improvement. Counsel then read the resolution of the Council dealing with the matter.

On Clause 6 Mr. Rigg asked that the houses in Abingdon Street should be exempted not only from the action of the clause, but from the whole Act. Mr. Talbot said that one of the objects of not exempting the houses from the whole Act was to secure, that very high or unsightly buildings should not be erected opposite to the Houses of Parliament. The Ecclesiastical Commissioners, who were the freeholders of the greater part, did not object to the Office of Works having a veto in regard to rebuilding. The committee refused Mr. Rigg's application. The remaining clauses having been disposed of, the Bill was ordered for report.

A New Fire Station at Islington was opened last week. It is situated in the Upper Street, within a few hundred yards of the Agricultural Hall, and in close proximity to the Vestry Offices. The station, which has been built by the London County Council Works Committee at a total cost of £20,594, contains a steam engine, a horsed engine, and a hose cart, and has accommodation for four horses, 19 firemen, and two coachmen. Originally the chief station for Islington was in the Essex Road, but as far back as 1893 it was decided to build a station suitable to the requirements of the district on the present site, but unexpected difficulties arose, and the result was that the Council had to go to Parliament to get power to build. The new station has a frontage of 54ft. to Upper Street and 50ft. to Florence Street. When the County Council came into existence they had 118 square miles of territory to protect from fire and risks, and a population of 4,600,000 people to look after. They have built eight new stations and rebuilt six others, and six are now in process of erection. About £100,000 more a year is now spent on the Fire Brigade service than formerly, and it is in a decidedly more efficient state than ever.

MASTER BUILDERS' ASSOCIATION.

THE National Association of Master Builders held its half-yearly meeting in Nottingham last Tuesday week. Mr. W. Sapcote, of Birmingham (president) presided. The half-yearly report having been adopted, Mr. C. W. Green submitted the financial statement. In years gone by they had experienced great difficulty in getting local associations to pay their half-yearly subscriptions punctually. He could quite understand that there was a difficulty in some districts which were thinly covered with building contractors. He wished to suggest that each builder in paying his wages each week should put a penny away for every pound paid. There was each year £60,000,000 paid in wages by builders. If the pennies were put into a reserve fund as he suggested the total would be £250,000. If this was done they would have very little difficulty in obtaining a very large reserve fund, which was an essential point in attaining an international association in the future.

A grant of £100 was then made to the Hull and Halifax Law Costs Fund, and it was further decided to make a special appeal on behalf of the fund to those associations which had not contributed.

On the motion of Mr. Green (Liverpool), seconded by Mr. Walters (Hull), it was resolved to appoint a committee consisting of three representatives from each of the four federated centres, together with the president, to meet the master plumbers and plasterers as to their affiliation with the N.A.M.B., and to take into consideration the terms upon which they can combine. Mr. Sapcote (president), Mr. Mansfield, Mr. Smithurst, Mr. Dawson, and Mr. Walters were appointed a committee to prepare evidence to give before the Parliamentary Joint Committee on the question of municipal trading.

The Builders' Foremen's scheme was then submitted. The chairman stated that the committee met in Manchester on this question, and recommended the scheme of the Northern Centre for adoption as soon as practicable. Mr. Smithurst explained the scheme, and stated that they had had two actuaries engaged, and had incurred considerable expense. Most of the trade societies carried with them benefits for the men and superannuation. They therefore could hardly go and ask foremen to join some other society unless they gave them the same benefits. In their scheme, the benefits were much better. They recommended that the masters pay the first six months' subscription, and thus put their foremen into immediate benefit. They had done this in the belief that in the next few years there would be an effort made to bring, by compulsion if necessary, out of the men's society all the men who were foremen. It was eventually decided to adopt the scheme as a national scheme, and to carry into effect the recommendations of the committee. The sum of £50 was voted towards the cost incurred in preparing the scheme was unanimously carried.

With reference to the finality of builders' estimates the council recommended the following clause:—"This estimate, should it be accepted, is subject to a written contract, pending all usual and proper terms being signed by the parties, and shall not be taken in itself as constituting a contract." There were several amendments proposed, and eventually Mr. Whittall proposed that a form of tender be issued by the National Association of Master Builders, and that all members be recommended to use that form and no other. This was seconded and carried.

The following resolution was carried on the proposition of Mr. Wall (London):—"When a builder's tender has been accepted, and the priced quantities deposited, and the schedule verified, that the said quantities shall be placed under seal, and only used for the purpose intended, viz., the settlement of accounts. Farther, that when the accounts are settled the quantities shall be returned to the builder. In case of instalments the builder's verified copy shall be used for rates and prices."

Mr. Church (Bristol) proposed the following resolution:—"That all specialists' provisional amounts in quantities should in future include

the costs of all attendance on the part of the general contractor or contractors, and where the payment of such sums devolves upon the contractor they should carry 10 per cent. commission to him or them. Also that in the case of all per cent. sums in quantities all goods should be ordered through the contractor." Mr. Whittall briefly seconded. Mr. Smithurst proposed as an amendment, "That they shall not be less than 5 per cent." The amendment was defeated, and Mr. Church's resolution was carried after a lengthy discussion.

The Bristol Local Association recommended the following resolution, which was adopted:—"No priced quantities shall be sent in with the estimate, but should members receive an invitation to tender for work where it is stipulated that quantities are to be sent in with the tender, the members are to immediately inform the secretary of the federation, and the committee will at once take up the matter, with a view to avoiding friction between the contractors and architects."

Mr. J. Wakeham (Plymouth) proposed that a committee be formed to meet and appoint from themselves a deputation to wait on the largest railway companies' engineers, with a view of inducing them to receive tenders unaccompanied by priced bills of quantities. Mr. Walters (Hull) seconded, and the resolution was carried. The following were appointed the committee, with power to add to their number:—The president (Mr. W. Sapcote), the vice-president (Mr. A. Krauss), Mr. R. Neill (Manchester), Mr. W. Shepherd (London), Mr. Nicholson (Leeds), and Mr. B. J. Greenwood (London).

The association voted £75 to Mr. J. Alfred S. Hassel (Liverpool) for services rendered during the plasterers' strike.

The following resolution passed by the Emergency Committee of the Lancashire, Cheshire, and North Wales Federation was approved of:—"That it be a recommendation to the National Association to amend the form of contract, by substituting 90 per cent. for 80 per cent., at the end of line 4, in clause 19,"—which at present reads—"When the value of the works executed, and not included in any former certificate, shall from time to time amount to the sum of £— or otherwise, at the architect's reasonable discretion, the contractor is entitled to receive payment at the rate of 80 per cent., &c."

In the evening a banquet was held at the George Hotel, the delegates being invited by the president (Mr. William Edgar) and the committee of the Nottingham Master Builders' Association. Mr. William Edgar presided. Mr. A. Krauss proposed "The Architects, Engineers, and Surveyors," to which Messrs. R. Evans and A. N. Bromley responded. Sir Thomas Roe, in bringing forward the toast, "The National Association of Master Builders of Great Britain," referred to the present crisis in the trade caused by the rise in the price of materials, and cautioned builders in the matter of giving under-estimates for work. Mr. Wm. Sapcote responded. Mr. Walters proposed "The Nottingham Association of Master Builders," to which the chairman responded.

CURRENT PERIODICALS.

The Journal of the Society of Estate Clerks of Works for July is mainly devoted to a well-illustrated article on "Bath: Ancient and Modern," by Councillor Cotterell, which was read as a paper before the society at their meeting at Bath in June. The paper is of exceptional interest.

The Journal of the Society of Architects has in the July issue the full text of the Architects' Registration Bill, which the society is promoting. We have nothing to add to our former expressions of approval concerning the measure. The qualifications, experience, and work of the eight architects selected to submit designs for the New Street frontage are here set forth in a ludicrous manner. The principal works of these architects have been in nearly all cases overlooked, and Mr. Reginald Blomfield's sole qualification to fame lies in the fact that he is a nephew of the late Sir A. Blomfield. Evidently the author believes in a far-reaching

heredity, but no excuse can be found for inserting this ridiculous notice.

The Slate Trades Gazette is much perturbed by some of the recent manifestations of trade unionism, particularly the limitation of output. "The Chicago Tribune" is quoted upon this latest phase and its evil results, and it is asserted that the trade unions, with their officials, "clothed in a little brief authority," are becoming a greater tyranny to the men than the employers whose sins they were created to deal with. This is only another way of saying that all men are not born with equal advantages and abilities and that you cannot play tricks with Nature. Perhaps we shall adopt Jerome K. Jerome's farcical suggestion of lopping off an arm or leg from the extra strong and big men, and performing surgical operations on those with extra brains in order to bring their wits down to the general level of imbecility. As our contemporary asserts, the limitation of output is a premium on laziness, which is the worst vice to be encouraged because it is the father of all the other vices.

The Scientific American, Building Edition (July), has its usual collection of designs for American houses and bungalows. We cannot understand the reason for giving interior views of the Hearst Californian seat. There is so much furniture and bric-a-brac in the rooms that any architectural effect they may possess is entirely lost.

Die Kunst (Munich), in common with the majority of art journals—English and foreign—continues to devote a great deal of space to the Paris Exhibition. In the July number a thoughtful essay on German art, by Mr. Alfred Lichtwark, is reprinted from the official catalogue of the German section; there are also a well illustrated article—the first, apparently, of a series—on decorative art in the Palaces of the Esplanade des Invalides, another on the restaurant in the German House, and a third on the decorative paintings. The author of the last named article makes the somewhat superfluous remark that you will not find at the Paris Exhibition any epoch-marking frescoes like those of Giotto or Masaccio. He points out, however, that some of the work is very interesting, though much of it clearly reflects the influence of Pavis de Chavannes. An article on French furniture at the Exhibition is illustrated by some strikingly original designs; some of the pieces are very graceful and pleasing, but in others the designer, in his efforts after originality, has only achieved eccentricity. Apart from the Exhibition matter, the principal article in this month's issue is one dealing with the dreamy and mysterious work of the painter Fernand Khnopff.

The Revue de l'Art for July is wholly given up to the Paris Exhibition. Its contents, however, are more varied and interesting than that fact might seem to imply, and the illustrations are reproduced in first-class style. The first article deals with paintings of the French School, and is illustrated by a fine heliogravure of M. Benjamin Constant's "Mes deux Fils" and an etching of M. Delaunay's "Pandore," as well as by several smaller illustrations. In a critical article on the sculpture at the Exhibition, M. Maurice Demaison deplores the "obsession of the antique," which in the reaction against the frivolous aestheticism of the eighteenth century has come upon French sculpture and robbed it of interest and vitality. "Whilst the survivors of the eighteenth century," he writes, "excel in bold and rapid sketches, and at the first glance catch their models in full action, in full life, in the attitude and movement which are habitual to them, while they give us, by dint of an accurate transcription of physical characteristics, the impression of a complete and absolute moral likeness, the exponents of the new doctrine display an evident anxiety to correct nature, to regularise and embellish its characteristics; they modify here the depth of the eyes, there the prominence of a bone, the wrinkles, the accidents, the peculiarities, the traces of thought or of mannerisms; all that in a face differs from the 'rule' adopted by the school they proscribe as a deformity, not considering that they are suppressing at the same time everything that makes the interest and

charm of a portrait. In their cold images, the shoulders shaped like those of Hermes, the sightless eyes, the symmetrical lines, the conventionally rounded model, the fixed expression, there no longer exists anything which displays individuality or palpitates with life." Other articles deal with medals and medallions and with silverwork at the Exhibition, while to those of antiquarian tastes probably the most interesting article in the number will be that on jewelry and enamelling, which forms the third of a series on the exhibits illustrative of the history of French art.

St. George (the journal of the Ruskin Society of Birmingham) contains an excellent paper by Mr. Charles Holme on "Ruskin's Nature of Gothic, and its Relation to Modern Handicraft." This famous chapter from the "Stones of Venice" is one of the best known and most valuable of Ruskin's writings on artistic subjects, and Mr. Holme does well to apply its teachings in a definite and practical way to present-day handicrafts. Some concluding reflections on the seriousness and the universality of art are very true and suggestive. "It often seems to me," says Mr. Holme, "that art is most welcome when it is most natural, and when it is produced without apparent effort; and that it is, therefore, especially pleasing when found in the simple articles of everyday use that custom may have made familiar to all. There is more art in a common Devonshire earthenware jug, with its coarse running-down glazes, than there is in the bedizened and begilt ewer of a china chamber service. There is more art in an old brass candlestick than there is in many a highly ornate modern lamp. There is more art in an old oak clothes-chest than there usually is in the carved and polished mahogany sideboard. And, finally, there is infinitely more art in the thatched Sussex cottage, or the half-timbered Shropshire one, than in the stone porticoed and balustraded suburban villa. Art is not ornament, although ornament may be art. Art is not a question of material—of stone versus wood, of gold versus clay. The commonest things may be artistic in a certain degree, while the most elaborate may lack art in every degree whatsoever." There are some interesting Ruskiniana in this number in the form of three hitherto unpublished letters of Ruskin reproduced in facsimile, and among the "Notes" at the end of the magazine we find some interesting reminiscences of Tennyson and some details of Cosme Colony—a remarkable social experiment that has its home in Paraguay.

Harper's Magazine for August contains an excellent sketch of the ruins of Montmajour, near Arles, and a little poem by William McLennan which well expresses the poetry and pathos of

"The mighty pile which lies here, wrecked and still,
Yawning to Heaven like an empty grave."

The other contents of the magazine are good and varied as usual, though there is nothing that calls for special comment.

Cassell's Magazine contains an article of some interest to engineers—an account of the construction of the railway to the summit of the Jungfrau. We cannot regard such an enterprise with very great enthusiasm, though it is no doubt a wonderful engineering feat. The author tells us that the railway will be no disfigurement to the great mountain mass, and we devoutly hope this anticipation will be realised.

Architecture for July has nothing to notice in the letterpress. There are a number of interesting illustrations of houses however. The residence at Germantown is simple and effective. The residence on Riverside Drive and Eighty-ninth Street, New York, is simple, but being absolutely symmetrical, even to making panels to match windows, and the detail Classic, it is quite dead. The architect of this residence would do well to study that by Messrs. Carrere and Hastings, architects, at Cold Spring Harbour, a most happy, generally symmetrical, building. Here very little ornament is used, and consequently the building gains in effect. The garden front is not so good, however, the stone dressings round the window and the entrance being rather distressing. Pennsylvania Institute for the Blind at Overbrook, the sketch for a garden terrace and

house, stable and garden at Greenwich, Conn., are all to be complimented. The Pennsylvania University Buildings for Deaf and Dumb are simple, but the central block is out of feeling. The two half-timber houses illustrated in the number are pretty, but as the construction is probably false do not rank as other than stage scenery.

The American Architect for June 30th contains an article entitled "A Day in Provence," illustrated by photographs of architectural works of those delightful old towns of Aix and Arles. Mr. Maurice M. Sloan contributes a specification for iron and steel work. The Americans being so far ahead of us in the use of steel for structural purposes this specification should be studied. The illustrations are most interesting. The design for Yale College Memorial Building at New Haven, Conn., reminds us forcibly of the new Record Office Building in Chancery Lane, London, and is just as unsatisfactory. There are also two further examples in Gothic style—Rylands' Library, Manchester, by Mr. Basil Champneys, and a design for a proposed church at Newcastle-upon-Tyne by Mr. George W. Ward. It is just as foolish to design now in Gothic as it is in the Classic styles: these styles being dead and the forms they assumed being produced by different conditions to those ruling at present. It stands to reason, therefore, that to use the traditional forms, now without significance, is akin to writing in a dead language to communicate with the people of to-day. And again, on this simile, to mix two dead languages or styles, or a dead with a living, is both ridiculous and in bad grammar. Mr. Basil Champneys in his library has produced a reserved and academic Gothic design of good grammar, but still the interest one takes in it is purely that of an exercise in a dead language, and it seems a pity that the great capabilities for design that Mr. Champneys has everywhere shown should not have been exercised in writing in a modern tongue. In this library everywhere are evidences of a thorough knowledge of the true principles of architectural design. Mr. Ward's church is not so successful, although much more modern in feeling—it requires more reserve. The library of a house at Tuxedo Park illustrated is too finical. Some fine old iron railings in New York are illustrated. In the number for July 7 the second part of the article on "A Day in Provence" is given, illustrated by a number of views in Arles. An interesting article is given on "Washington, the City Beautiful." The house at Larchmont, N.Y. (Ludlow and Valentine, architects), is, on the whole, a very successful design: we will not criticise the detail, the architects no doubt know its faults as much as we do. The design for a mausoleum is an atrocious and senseless piece of work, for where is the need for buttresses and flying buttresses in this structure of about twenty feet in height in the upper part which it is pretended is supported by them. The detail is of course appalling. The number for July 14th contains an illustrated article on the Paris Exhibition. Two of the illustrations in the plates are of successful works—an apartment House by Messrs. Cram, Goodhue and Ferguson; and the Main Entrance to the Judson Memorial Church, Warlington Square, New York, by Messrs. McKim, Mead and White. The latter shows a capability for design that is rather thrown away upon dead Classic styles. The illustrations of the restoration of Ordsall Hall, near Manchester, call for some general remarks upon the subject of restoration. Restoration is solely done with the object of giving an idea of the appearance of the structure in its complete state. This is a want that it is certainly permissible to fulfil—but not by destroying the original or falsifying the history of the building. No collector of small works of art or antiquities, such as pictures, books, statues, &c., would esteem a copy or a restoration as highly as the original, and it is merely the extension of this view to the larger and often more important historical works of architecture and building that shows the falsity of the principle. When it is recognised that the style of buildings of the past were an outcome of the spirit of the age they were produced in it will be seen that they serve as no other things can do the place of historical documents. If the

preservation of such documents comes in the way of the absolute needs of humanity we recognise that they must go, but then any parts of them which are of absolute historical value should be preserved in some other place, such as a museum. Now in this case of Ordsall Hall was it necessary that a church should be built against this hall? We think not. A site could have easily been procured elsewhere. Again, why should the whole history of the house have been falsified by adding new parts, in direct imitation of the old. If a reproduction of its original state was required it could have been done elsewhere, and the old materials not destroyed or re-used in the reproduction. This restoration is merely a falsification of history. A reproduction is merely a toy or a peep-show, and not a serious historical document. Ordsall Hall was quite capable of being kept without falling into further decay for many years, and when beyond keeping all parts not of value in themselves should have been destroyed and a modern building erected, to serve, as this has done, as a record of the age in which it was built. Reparation is estimable; restoration is pernicious, and often becomes absolutely false. We, of course, recognise that the owners of the site should have been recouped by some public body for any expense the leaving of this unoccupied building might have entailed.

Masters and Men.

Strike of Quarrymen.—One thousand quarrymen, masons and labourers in the Matlock district came out on strike last week for an advance of $\frac{1}{2}$ d. per hour.

North-East Coast Engineers' Dispute.—The vote taken on the North-East Coast among the Amalgamated Society of Engineers as to whether they were prepared to cease work on August 18th, owing to the employers' uncompromising attitude on the wages question, has not given the necessary majority for a strike. Consequently a fresh vote has been ordered to be taken on or before August 7th.

The Ipswich Bricklayers' Dispute remains without particular alteration in the situation. The number on strike, which last Monday week was 181, has been reduced to 84 and a further reduction is anticipated. The men in work are being levied at the rate of 3s. per head per week, and as there are about 170 men at work it is expected that the strike pay of 15s. per week will receive a substantial augmentation.

Labour Conciliation and Arbitration.—The annual aggregate meeting of representatives of the London Chamber of Commerce and delegates of trade unions interested in the work of the London Labour Conciliation and Arbitration Board was held last week. Mr. S. B. Boulton, the chairman of the board, in presenting the annual report, said that there had not been so many disputes as usual during the past year, and those that had come before the board had been satisfactorily settled. He asked the delegates present that in case of disputes the parties interested should place their grievances before the board before a strike actually took place. The board had been in operation for ten years. In nine cases out of ten if the parties came to them they were able to settle the disputes. Besides the work they had done there were also cases in which they had given advice. They had also done educational work. They had educated each other to such an extent that those on the board had learned a great deal since they joined. That board had also taught the world that working men can make as impartial arbitrators as employers.

Mrs. Brown-Potter, the well-known actress, has just had a Thames villa-residence erected at Bray from the designs of Messrs. Stephen Sadler, F.R.I.B.A., and R. C. Davy, M.S.A., of Maidenhead and Oxford. The same architects have also just completed a large residence next to the Guards' Club, Maidenhead, for Mr. J. W. Benson.

Builders' Notes.

Building Scheme at Ostend.—It is proposed to erect an extensive block of buildings on the sea front at Ostend, between the King's chalet and the Hôtel North. The new block would take the form of an arcade, comprising 120 shops.

Hornsey District Council.—A buildings inspector for Hornsey has been appointed by the District Council. One hundred and twenty-six applications were received. Mr. A. Burbidge, of No. 11 Merchison Road, Leyton, at present a building inspector in the service of the Leyton Urban District Council, was appointed.

A Building Agreement.—Mr. E. W. M. Corbett, Cardiff, the arbitrator appointed by the High Court of Justice, recently heard the case of *James v. Griffiths*. It was a claim by Jno. James, builder and contractor, Merthyr Vale, against Mrs. Cecilia Griffiths, of the Navigation Hotel, Aberfan, for a sum of £290, being the balance due to him under a building agreement. The arbitrator, in his award, ordered the defendant to pay to the plaintiff the sum of £250, each party to pay their own costs.

Very Speculative Builders.—The first meeting of creditors of David Phillips and Philip Davies, trading as Phillips and Davies, builders, Bridgend Road, Maesteg, was held at Cardiff recently. The debtors, both tinplate workers, commenced business as speculative builders in 1896 with a capital of £15 and £10 respectively. They had built twenty houses, all of which, with the exception of five, had been sold, and upon those five there remained due £1,130 15s. 11d. These houses were valued at only £800, and the mortgagees were returned as unsecured creditors for the balance. Six houses had been commenced at Barnado Street, Maesteg, upon which debtors had received £470 19s. 3d. These houses were valued at £500, and there was an estimated surplus therefrom of £20 9s. 5d. The Official Receiver remains trustee.

New Buildings at Hastings.—The Hastings Town Council have approved the following plans of new buildings, &c.:—Three pairs semi-detached villas, St. Saviour's (Parish of St. Leonard), for Mr. G. T. Jenkins, owner, per Messrs. Elworthy and Son, architects; Wesleyan Chapel, Norman Road (Parish of St. Mary Magdalen), for Trustees of Wesleyan Chapel, owners, per Mr. J. Weir, architect; new shop, 1 Stonefield Place (Parish of St. Mary-in-the-Castle), for Mr. E. Coussens, owner, per Messrs. Cooper and Coussens, architects; cart lodge at rear of Hughenden Road (Parish of St. Helen's), for Mr. T. L. Smith, owner, per Mr. A. Dray, architect; alterations, No. 2 Maze Hill (Parish of St. Mary Magdalen), for Mrs. Dengate, owner, per Mr. P. H. Tree, architect; fifteen cottages near the Ridge, London Road (Parish of St. Helen's), for Mr. H. Arnold, owner, per Mr. H. Ward, architect.

Annoyance from Building Operations.—Mr. A. Bird, Church Street, wrote to the Rugby Urban District Council complaining of the nuisance and annoyance caused to himself and customers by the alterations being made to the adjoining premises. He contended his premises had not been properly protected by the builder, and during the alterations bricks and other débris fell into his doorway several times, not only damaging his stock-in-trade, but being a source of danger to customers visiting his shop. It was generally considered that hoardings should be erected while alterations similar to those in question were being made, but the Surveyor said it had not been the practice to compel builders to do so in the past. He, however, thought it ought to be done in every case. It was decided that in future hoardings must be erected in every case where alterations were being made to the fronts of business premises.

Building at Ayr.—The Works Committee of the Ayrshire County Council have

passed the following plans:—John Cowan, New Cumnock, for the erection of workmen's houses at Bank, New Cumnock; James S. Stevenson, Valepark, Prestwick, for erection of double villa at Prestwick; James Macdonald, Eglington Arms Hotel, Dalmellington, for additions to hotel; Rev. J. Spence, for addition to O. S. Manse, Auchinleck; Robert Gemmill, for double villa at Prestwick; William McGeachin, Comely Bank, Prestwick, for erection of double villas at Monkton Road, Prestwick; Dalmellington Iron Co., for erecting cottage at Waterside; Wyllie and Co., Prestwick, for erecting dwelling houses at Briarhill, Prestwick; James Young, New Cumnock, for erection of cottage there; R. M. Davidson, Drumley, for erection of cottage at Drumley; Thomas Higgins, Prestwick, for erection of houses on Briarhill Road, Prestwick. A small sub-committee has been appointed to meet the first Tuesday of each month, at two o'clock, to consider plans under the new by-laws, consisting of Messrs. Bell, Davidson, Montgomerie and Ligertwood; two a quorum.

The City Property Market.—At the London Auction Mart, Tokenhouse Yard, E.C., on Wednesday, the two shops and suite of offices, Nos. 12 and 13 Poultry, City, let at rentals amounting to £1,384 per annum, and held on lease from the Governors of Christ's Hospital for an unexpired term of 34 years at a ground-rent of £485 per annum, were together passed at £7,500, while the 18 years' Crown lease of the business premises No. 34 St. James's Street, W., let on lease at a rent of £525 per annum, was likewise withdrawn at £6,500. The old-established hostelry known as the Royal Victoria and Bull Hotel, Rochester, which is freehold in tenure and let at £150 per annum, changed hands at £7,900, while the freehold with possession of the fully-licensed property known as the Colonnade, Brighton, realised £8,200. A freehold ground-rent of £200 per annum, secured upon the office premises No. 10 Ironmonger Lane, Cheapside, of the rental value of £500 per annum, lease 92 years, was sold for £5,600, at which price it will pay the purchaser $3\frac{1}{2}$ per cent. A freehold site in Shoreditch, occupying an area of 20,000 square feet, realised £16,500, while the freehold property, No. 67 Lincoln's Inn Fields, containing three floors and offices, comprising 22 rooms, and having a ground floor area of about 2,500 superficial feet, changed hands at £14,400.

Who Should Purchase a Jail?—Sheriff Strachan recently decided a case relating to the sale of the old jail, Rutherglen, belonging to the Town Council of Rutherglen. The plaintiff was George Williamson, builder, Monrave House, Rutherglen, who asked the Court to find against the vendors of the property, who were the defendants in the case, that he was the purchaser of the materials of the old jail at the price of £20. The defendants, he said, put the materials up for public auction on June 6th last. He and John Love, builder, Rockland, Rutherglen, who was also sued as a defendant in the action, were present at the sale, and both made offers, the plaintiff's bid being £20. Love and he continued the bidding thereafter, and at the close the auctioneer knocked the subjects down to Love at the best bid of £27. The plaintiff pleaded that Love, being a member of the Town Council, and therefore one of the expositors of the materials, he was disqualified as a bidder or purchaser at the auction, and that the jail materials should pass into the plaintiff's hands at the first bid of £20. At a former stage in the case the Sheriff granted an interim injunction against the defendants receiving the materials sold pending the settlement of the action. His lordship now found the plaintiff has no title to challenge the transaction under which the defendant Love became the purchaser of the subjects.

Sheffield's Building Boom.—House building in Sheffield has been going on at a very rapid rate during the past two years, but there are signs now that the boom is at an end. From enquiries amongst local builders there is a considerable diminution in the amount of new property projected. The cost of building material is now so high that it is impossible to

erect houses which, at the rents obtainable, will afford a fair return upon capital. Hence investors are shy of this kind of investment. Owing to the spell of good trade and to the development of the suburbs of the city under the stimulus of tramway facilities, house property has been planned and carried out very rapidly of late. In 1899 the number of houses sanctioned on plans by the Corporation sub-committee which deals with the matter was 3,618, as compared with 3,566 in the previous year. The average growth of the city since the by-laws were adopted in 1884 has been 970 houses per year, and it will be seen, therefore, that the years 1899-1900 were exceptionally brisk in the building trade. The present year opened under similar conditions, and up to the last meeting of the City Council the number of houses for which plans were submitted and approved was 1,530. This does not look like any great falling off, but it is worthy of note that it was in the early months of this year that most of the property was projected, and, of course, all of it may not be immediately carried out. Lately the plans sub-committee have not had many plans for new house property before them. At a meeting of the committee last week only 69 new houses were approved, and at the two previous fortnightly meetings the numbers were 62 and 77. These figures are considerably below the recent average. It does not follow at all because there is no longer a boom in house-building that more houses are not wanted. Overcrowding still exists in some parts of the city, and it is simply the high cost of building which has given a check to enterprise. At Walkley, where new dwellings have sprung up very rapidly, the supply seems to have overtaken the demand. This is not the case in other parts of the city, however, and building is still going on fairly rapidly in the Ecclesall and Abbeydale districts, which do not seem to have yet shared in the general lull.

Deviation from Plans.—At Sheffield Police Court, before the Stipendiary Magistrate (Mr. Welby), Harry Ripley, of 245 Penistone Road, builder, was summoned recently on the information of the City Surveyor for erecting, on March 22nd, a new building, to be used as a dwelling-house, at the corner of Eden Street and Driffield Street, which had not, at the rear, or at the side, at least 150 square feet free from any erection thereon above the level of the ground. There was a second summons against the defendant alleging that he did not give to the Council complete plans and sections of every floor of eleven dwelling-houses which he intended to erect in Eden Street and Driffield Street. On November 24th last the defendant sent in plans for ten houses, situated in Eden Street, which were approved. On March 22nd a building inspector went to inspect the houses, and found that one house, shown on the plan, had been converted into two; and also that a portion of ground had been built further over than was shown on the plans approved. At the rear of a building intended to be used, part as dwelling-house and part as sale-shop, the air space was 68ft., whereas the minimum laid down by the by-law was 150ft. The defendant sent in an amended plan, which was disapproved. Plans had not been sent in for the houses as they at present stood. The defendant said he had added five feet since the offence, and the air space was over 300ft. He had not split the house into two. Cross-examined, the defendant said on March 22nd the house in question had two sets of stairs, two kitchen ranges and two sinks. Since that time he had removed the ranges, and a doorway had been broken through a wall. In reply to the Stipendiary, the defendant said he found that his foreman was making the house into two at about the time of the alleged offence, and he stopped him. The second summons was withdrawn, the Stipendiary remarking that they could not consider a deviation from a plan the same as not sending in a plan. With regard to the first case there seemed to have been a breach of the by-law. He could come to no other conclusion than that the defendant was making this house into two, and so it would have stood if his attention had not been called to it. The penalty was £5 the defendant would be fined £2 10s. and costs 7s.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"May we not say, however, that the hour of Spiritual Enfranchisement is even this: When your Ideal World, wherein the whole man has been dimly struggling, and, inexpressibly languishing to work, becomes revealed, and thrown open; and you discover, with amazement enough, like the Lothario in 'Wilhelm Meister,' that your 'America is here or nowhere'? The Situation that has not its Duty, its Ideal, was never yet occupied by man. Yes here, in this poor, miserable, hampered, despicable Actual, wherein thou even now standest, here or nowhere is thy Ideal: work it out therefrom; and working, believe, live, be free. Fool! the Ideal is in thyself, the impediment too is in thyself: thy Condition is but the stuff thou art to shape that Ideal out of: what matters whether such stuff be of this sort or that, so the Form thou give it be heroic, be poetic?"

THOMAS CARLYLE.

Our Inset Sheets.

THE House at Limpsfield has not been built as designed by Mr. Voysey, a dispute having arisen which shows the continual meddlesomeness that interferes with the carrying out of an architect's artistic conception. The house was designed for Mr. C. A. Sewell, but that gentleman concluded the purchase before the plans were passed by the owner, who demanded that the elevation should be more cut up and that red tiles should be substituted for slates. To do this Mr. Voysey absolutely declined, and consequently some other architect had to be employed. The house was to be built of brick, cement roughcast; Bath stone window and door dressings; and with iron casements and green slate roof. Mr. Voysey's other house at Tooting Bec Common is only a design for a house proposed to be built with stables and coachman's quarters all under one roof. The material intended to be used was brick roughcast, green slate roof with lead pipes and ridges, stone window dressings and iron casements. The weathercock was put into the perspective, but never intended to be placed where shown, as it would not work truly.—The bank at Ilford stands at the junction of Barkings Lane with the High Street, in the centre of the old town. The materials used were Ancaster stone on a granite plinth, with Eureka green slating on the roof, the joinery and fittings of the bank being of Spanish mahogany. The builders were Messrs. Perry & Co., of Bow. The bank was opened a short time ago. The building at Chichester is situated in East Street, within a few yards of the old Market Cross, and is on the site of the old Swan Inn. Very large vaults extended over the whole site, separated by thick rubble walls, and several pieces of fourteenth and fifteenth century work were found in the walling and spandrils, together with two or three pieces of Roman street channelling. The materials used are Portland and Ancaster stone for the front, with Broseley tiling, the joinery and fittings of the bank being of wainscot. Mr. A. Burrell of Littlehampton is the builder. Messrs. Chaston & Perkin, of 5 Union Court, Old Broad Street, E.C., are the architects of these two buildings.

Still these Competitions!

THE Machynlleth School Board is quite overwhelming in its extravagance in the endeavour to encourage architects on their road of Art. It is now anxiously awaiting results from its perhaps too venturesome course, but still, determined to do the correct thing, is willing to face the splendour of the designs that are expected to be a revelation to the architectural world. The Board have advertised for a set of plans for school buildings for the town of Machynlleth, consisting of Mixed and Infants' departments, providing accommodation for 270 and 130 children respectively, together with a Master's House. These plans,

the Board is careful to state, must be in conformity with the requirements of the Board of Education, as stated in Schedule VII. of the New Code of 1900. For all this a "prize" of £30 is offered! The selected, or prize, plan is to become the property of the Board. Should the author of the selected plan be appointed to superintend the work, the prize money is to be part of the remuneration. Each plan is to be accompanied by full specifications, detailed Bills of quantities, estimated cost of buildings and other particulars, three testimonials and past experience, and the terms upon which the architect [the appeal is addressed to such] would be willing to undertake the supervision of the erection of the buildings.

King's College Prize Winners.

MR. R. ELSEY SMITH, Professor of Architecture at King's College, London, sends us the following list of prize winners in the Division of Architecture at the College:—*Day Classes*.—Architectural History: (1) Gold medal and books, Harry Prince; (2) silver medal and books, Gilbert Henry Lovegrove. Architectural Studio: (1) Gold medal and books, N. Austin Leech; (2) silver medal and books, Harry Prince; (3) bronze medal, Gilbert Henry Lovegrove and John Parlett. Building Construction: 1st year—(1) silver medal and books, W. J. Marlow; (2) bronze medal and books, O. C. Thompson. 2nd year—(1) silver medal and books, J. R. P. Rowley; (2) bronze medal and books, R. W. Edwards. 3rd year—silver medal and book, N. A. Leech and G. H. Lovegrove. Quantities: (1) Silver medal and books, G. H. Lovegrove. *Evening Classes*.—Architectural History: (1) Silver medal and books, Harry Prince; (2) bronze medal and books, Ralph C. Willis; (3) books, G. H. Lovegrove. Architectural Studio: Bronze medal and books, F. A. Sprules. Building Construction: (1) Silver medal and books, F. Hartnoll; (2) bronze medal and books, F. J. Jones; (3) books, C. A. Colyer. Sanitary Science: Alderman Sir Faudell Phillips' medal, George Henry Spears. Constructional Drawing-book Prizes: (1) F. J. Jones; (2) C. H. Wheeler; (3) A. Bradburn. Quantities: Book Prizes—(1) A. Bradburn; (2) J. D. Robertson; (3) A. Miles.

Fire Tests.

THE concluding series of fire tests of the present session conducted under the auspices of the British Fire Prevention Committee were undertaken last Wednesday at its testing station near Regent's Park, this being the last occasion on which this can be used, as the committee have to move their plant by the autumn to make room for an extension of the Great Central Railway, which has obtained Parliamentary powers over the property in question. The occasion was marked by the chairman of the committee entertaining a party at luncheon, among whom were Mr. Arthur Cates, the Crown Surveyor; Major-General Festing, of the South Kensington Museum, and several other officers of the committee. There was a very large attendance of district surveyors, Government and municipal officials for the actual tests, which comprised a continuation test with a patent floor which had already been subjected to a preliminary investigation a fortnight ago and with a partition, as well as two tests with iron doors. The door tests were of considerable importance as comparative tests, as one of the doors was built in accordance with the requirements of the London Building Act and the other in accordance with the requirements of the insurance companies. It was found that, although the Building Act door was of better construction than really required by the Act, the insurance door, in which only the minimum requirements were observed, was the more efficient. The floor in question was constructed by the Mural and Decorations Syndicate, Limited. The preliminary test lasted 1½ hour at temperatures up to 2000° Fahr., followed by an application of water. The continuation test was for another hour at similar temperatures, with a further application of water. The problem was to see what the resistance of this floor would be after having passed through one

ordeal of fire, the matter being of the highest importance to insurance companies as a question of reinstatement. The partition under investigation was the "Cunah-Wright" partition constructed by the Fireproof Syndicate, Limited. The test was of one hour's duration at temperatures up to 2000° Fahr., with a final application of water. As regards the iron doors, these doors were simultaneously subjected to fire up to 2000° Fahr., followed by the application of water, the test being of one hour's duration.

A Technical Museum for Dundee.

THE new museum in Dudhope Park, Dundee, was opened last week. Its establishment is largely due to the overcrowded state of the Museum in the Albert Institute, which made it impossible to properly arrange and classify some of its departments. The museum has been formed by reconstructing the eastern portion of the large building in Dudhope Park formerly used as officers' quarters. To it have been transferred the famous Watt-Boulton engine from Douglas Bleachfield, along with the exhibits in the Albert Institute of an engineering, mechanical and industrial character. The object the Free Library Committee have in view is to organise a Museum of Science and Technique, an institution greatly required in Dundee and now deemed absolutely essential everywhere for the effective teaching of these subjects. The Science and Art Department, South Kensington, not only approved of the reconstructed Dudhope buildings as suitable for a museum, but also gave a grant in aid of the purchase of the most up-to-date models of engineering and mechanical details and building construction. A second loan collection from South Kensington has just been installed. This collection does not include mechanical models, these having been purchased outright with the assistance of the grant in aid. The loan collection embraces specimens of wood carving, wrought iron work, and other craft work. There are also included various specimens of modern carved work, embossed leather work made by students of the Kirkby Lonsdale and Leighton Buzzard handicraft classes, and specimens of the hammered copper and brass work made at the Keswick School of Industrial Arts.

Finds in Ecuador.

NEAR Manti, Ecuador, is a remarkable archaeological relic, one of the most interesting monuments in South America of an unknown and extinct civilisation. Upon a platform of massive blocks of stone, upon a summit of a low hill in a natural amphitheatre and arranged in a perfect circle, are thirty enormous stone chairs, evidently "The Seats of the Mighty." Each chair is a monolith, cut from a solid block of granite, and they are all fine specimens of stone carving. The seat rests upon the back of a crouching sphinx, which has a decidedly Egyptian appearance. There are no backs to the chairs, but two broad arms. This is supposed to have been a place of meeting—an open-air council of the chiefs of the several tribes that made up the prehistoric nation which was subdued by the Incas of Peru several hundred years before the Spanish invasion. Tradition teaches with more or less obscurity that the territory now known as Ecuador was divided into several independent but allied kingdoms, and that the people reached a high stage of civilisation. They worshipped the sun and the moon, to both of which they raised temples. They had a knowledge of astronomy and were skilled in other sciences and art, but they had no written language, and the only records that tell of their existence are mute monuments like the chairs described.

£1,000,000 for Workmen's Dwellings.

THE will of the late millionaire carrier of Golden Lane, City, Mr. William Richard Sutton, which has lately been proved, provides that, after settling various annuities on his wife, relations, and a few faithful servants, out of his personal estate, the residue and the whole of his real estate shall be appropriated for the housing of

poor but regularly-employed working men. The blocks of buildings are to be erected in London or in the country. The districts chosen must be where a real difficulty is found by artisans and others in getting housing accommodation. This point is made very explicit in the will. Accommodation is to be provided in decidedly overcrowded districts. The relief is not to be sought for by resorting to sparsely populated suburbs, but to the very centre of plague spots. The buildings, when erected, are to be called the "Sutton Model Dwellings." Certain relatives of the deceased millionaire are going to oppose the will, but with what success it is impossible to forecast. The real value of the estate cannot yet be ascertained. For the purpose of probate the will has been proved at quite a nominal sum. How much will be available for the benefit of the working man cannot yet be estimated. The sum is bound to be between £1,000,000 and £2,000,000. The design, extent and site of the buildings are left entirely to the discretion of the trustees, Mr. Chas. T. Sutton (a brother), Mr. Chas. E. T. Lamb and Mr. Thomas Watson. These gentlemen are empowered to buy, sell, and mortgage property as long as dwellings are erected which will enable working men to rent habitable dwellings at a lower figure than the average rent of the district chosen. On no account must families be admitted rent free.

Housing in Edinburgh.

IN his annual report, just issued, the Burgh Engineer of the city of Edinburgh (Mr. John Cooper) gives the following in reference to the housing of the poor:—"The question has again and again been raised: Are you providing housing for the evicted slum dweller?—that is to say, for those persons whom the civic authority are bound to provide for in this way. It would be a matter of satisfaction were it possible to answer this question in the affirmative, but with all the number of houses of the cheapest class which have been erected in Edinburgh during the last five years the question is scarcely so answered. No doubt the sanitary conditions of the new housing must be taken into account, but people cannot live on sanitary conditions alone, however superior. Why should not Part III. of the Housing of the Working Classes Act, 1890, be taken advantage of? Should cheap and handy travelling facilities be provided in order that the people travelling to and fro to their work and otherwise be fully accommodated? Will the labouring classes take advantage of such houses when erected? Short of this there does not appear a way out of the difficulty, excepting municipal aid, and most people will admit that it is fraught with mischief to attempt to pauperise. It is out of all reason to suppose that slum clearances are the remedy, or that the persons disoused by such clearances can be rehoused on the same areas. The remedy for overcrowding, which is one of the main evils which are struck at by our slum clearances, involves the acquisition of new sites on which to erect new housing. For such new sites one naturally turns to unoccupied suburban areas, and the available existing enabling legal machinery is Part III. of the Housing of the Working Classes Act, 1890. To my mind the Corporation should, without loss of time, possess itself of sufficient suitable cheap lands for the purpose."

The Ostian Marshes.

THE eminent Italian archaeologist, Signor Constantino Maes, has lately submitted a memorial to the Government in which he affirms that 3,000 bronze tables, constituting the records of Rome from its foundation to the time of Vespasian, are buried in the marsh at Ostia, near Rome, having been carried to Ostia after being rescued from the fire which devoured the Capitol in the year 69 of the Christian era. Signor Maes proposed to the Government that the marsh should be completely drained in order to recover this invaluable historic treasure. A commission will be appointed to investigate the matter. Some years ago Signor Maes announced that if excavations were made an obelisk would be found behind the church at Ostia. The excavations were made and the obelisk recovered.

A.A. SUMMER VISITS.

STOWE HOUSE, BUCKINGHAM.

STOWE HOUSE, the celebrated seat of the Dukes of Buckingham, was visited on Saturday last, July 28th, by the Architectural Association as the fourth summer visit of the session, by the kind permission of the Baroness Kinloss, its owner.

This magnificent edifice is one that must be placed in the same category of illustrious English homes as Blenheim and Castle Howard—works that are not only contemporary with it, but were produced by the same architect, Sir J. Vanbrugh.

The ground plan of the building may be said to be a symmetrical arrangement worked from a centre consisting of an enormous rectangular block with large pavilion wings united to it by buildings of a lesser height: the centre and the pavilions, rising to a great height, form an academic architectural composition of enormous magnitude, the length over all being a trifle over 930ft. The entrance, or north front, is designed something after the manner so nobly carried out at Blenheim, with a projecting colonnade, quadrant shaped on plan, covering the north ends of the pavilions.

The entrance to the house is by a flight of thirty-one steps leading up to a loggia or great portico. On either side of these steps are placed two remarkable copies of lions that formerly occupied a similar position in regard to the garden entrance of the Villa Medici at Rome, but which are now preserved in Florence. A large "formal" garden on either side of this entrance stretches the whole length of the façade, and is enclosed by a very elegant iron balustrade, with Portland stone piers surmounted by antique vases of stone or marble.

The great loggia or entrance is formed of six columns, each being 3ft. 7in. in diameter, rising to a great height, with finely carved capitals supporting a well-designed frieze and cornice with an admirably proportioned pediment. Above this comes the severe lateral lines of the entire centre block, terminated with a well-designed but poorly-detailed balustrade that passes around the entire building in the centre. The lesser portions of the façade that connect the pavilions with this loggia have a well proportioned columniation, with a good type of window placed between each; but here, as at Blenheim and other buildings of the period, the merit of the detail throughout is very unequal—some of it is coarse, other portions being designed with great refinement. The whole rests upon a powerfully rusticated basement storey.

Behind the pillars of the loggia is the entrance doorway, of great size, designed with good taste: this leads into the entrance hall, a large chamber that depends for its effect more upon good proportion than design. It has, however, a finely painted ceiling by Kent, some interesting sculptures and fine pictures well disposed about its floor, and the walls give it distinction. This opens into the great saloon, an oval apartment of large size. Around this saloon are placed sixteen columns in Scagliola by Bartoli in imitation of Sicilian jasper, these supporting a cornice adorned with Classic masks of satyrs and Bacchantes. Above this an Attic frieze is placed, the decoration of it consisting of more than 300 figures of a large size designed and executed by Valdie, the scheme representing a triumph and a sacrifice; the coved ceiling is divided into richly-decorated compartments, with, at either end, large female figures bearing escutcheons containing the arms of the first Earl Temple and of George, Marquess of Buckingham; in the centre is placed an extremely tasteful and elegant dome, the opening lighting the apartment. Around the saloon are placed sixteen niches between the columns, containing

antique statues of Roman deities, poets, generals, &c., and alternately large richly gilded bronze candelabra of large size though slightly heavy in design; the pavement is entirely in white Carrara marble. The state dining room that is adjoining is an immense apartment with a very finely designed albeit heavy ceiling, the walls hung with very wonderful old Brussels tapestry representing the triumph of Ceres, Bacchus, Venus, Mars and Diana. These tapestries are to be looked at strictly as works of art; the colouring, apart from the compositions, is more akin to the quality of fine pastel colours, although mellowed by age, than to the tints usually associated with the schemes of colouring seen in antique needlework, the lightness and richness of the whole set being very remarkable.

In this room are two fireplaces of large size and elaborate design in Siena and white Carrara marble. Above each one is a finely designed wooden overmantel with carvings by Grinling Gibbons—the centre panel in each respectively represents "A Goddess Conducting Learning to Truth" and "Learning Conducting the Muses to Mount Parnassus." These very fine works have however been painted to represent bronze, a thing, like so much else of the same order, that is in very questionable taste; the finest one is in many beautiful colours.

The state drawing room, of a very great size, is hung with a very elaborate old yellow silk brocade, with a cornice and ceiling richly gilded. From it in the centre hangs an elaborate crystal chandelier, surrounded by smaller ones. The furniture here is extremely magnificent.

The music room is a richly decorated chamber having a ceiling and cornice supported at each end fine by Scagliola columns imitating Siena marble, with richly carved and gilded capitals by Bartoldi. The paneling is filled with designs taken or adapted from Raffaele's works in the loggia of the Vatican. The chimneypiece is a good specimen of its style carried out in a greyish white marble with Rosso Antico panels.

The Rembrandt room, architecturally, is chiefly remarkable for its ceiling, representing "Venus at her toilet." The paintings here and elsewhere in the house are by Claude, Poussin, Ostade, Cuyp, Teniers, Dow, Vandyck, Rembrandt, Pietro da Cortona, Rubens, Durer, Dolce, Corregio, and many others. The chapel is not a very interesting place: it is elaborately panelled throughout in fine cedar, with a large gallery executed in the same material, the greater portion of the wood coming from a vessel captured from the Spanish, the remainder from the chapel at Bulstrode, the seat of the then Duke of Portland; it was all worked by "one Michael Clerke, the carving being done by Mr. Grinling Gibbons." The organ belonged to James the Second. The State bedrooms, in crimson silk damask, with a ceiling in colours of the Insignia of the Garter, supported by white and gold marble pillars, and the State dressing room, hung with splendid Brussels tapestry, are all magnificent. The great library, 75ft. by 25ft. by 25ft., contains 20,000 books, pictures, and a beautiful wrought-iron balustrade to its gallery is a very clever design. The MS. library is in a style of carpentered Gothic by Soane. The armoury, approached by a curious stair in the wall, is very interesting. Many other fine rooms and sumptuous decorations were seen, when the members left the mansion to inspect the grounds, laid out by Lancelot (Capability) Brown, and which remain much as he left them: the orangery, some 130ft. in length, the large natural-history museum, the Bourbon Tower with the oaks planted by Louis XVIII. and family; the Gothic temple built to receive ancient painted glass, in a pre-Strawberry Hill type of Gothic, and many other shrines, temples, grottoes, fountains, garden seats, rotundas, pyramids, obelisks, built in a great variety of marble; and what caused general admiration, a copy of the Palladian Bridge at Wilton, that here seemed larger and to form with the connecting arches a better composition than the original, the whole of these things in the gardens forming a grand architectural composition of a great mansion and splendid gardens architecturally disposed.

H. D. W.

Professional Practice.

Bristol.—An important extension scheme has been carried out at the Bristol City Asylum at Fishponds. The work is now practically completed. The principal extension comprises a new wing on the western side of the long range of asylum buildings—the female side of the institution. The cost of the new buildings was at the outset estimated at about £45,000. The additional western wing contains four wards to accommodate 150 females, so that the asylum has now room for just upon 1,000 patients; and preparation has been made for the transfer to Fishponds of 40 patients, chiefly belonging to the added areas of the city, who have been boarding at Gloucester Asylum. The wing is constructed of durable stone with freestone dressings to harmonise with the structure previously existing. The various departments are well-lighted, airy and lofty, and electrical fittings extend through the building. In the wing, which, like the rest of the premises, has two storeys, is an infirmary ward as well as an infirmary day room. A nurses' annexe has accommodation for eight night and two day nurses, and a dining and recreation hall. Mr. H. R. Withycombe, clerk of works, carried out the work.

Dorking.—The permanent Homes of St. Barnabas are being erected near Dormans Station. The buildings, which are intended to provide a home for aged and infirm clergymen of the Church of England, were commenced in the autumn of last year. Accommodation will be provided for some 60 inmates when completed. It is not, however, the intention of the Council, at present, to proceed with more than the erection of the west wing and the administrative block and nursing wards in the north wing, about one-third of the scheme. To complete the first block £1,500 is still required. The architect is Mr. C. H. Rew, of Berkhamstead, and the builder Mr. H. Young, of East Grinstead. The cost of work now being carried out will be about £10,000, but that of the completed scheme will be between £40,000 and £50,000. The building is to be composed of red brick to the ground floor and part of the upper floor; the remainder will be rough cast. The roofing is to be of Broseley tiles, and the whole of the windows and door arches are to be of Hackenden stone. The casements are to be of wrought iron and diamond square lead glazing throughout.

Newquay, Cornwall.—The new Headland Hotel has just been opened. The building is one of three storeys, with ground floor and basement, and has cost £500,000. The material used is native stone raised in the grounds, relieved with Dennis's Ruabon red terra-cotta. The approach or eastern elevation consists of a central tower rising over the main entrance to a height of about 100ft. to the vane. Right and left of this are two wings, one giving accommodation to the billiard and smoke rooms, and the other to the offices, with long connecting curtain walls, making a façade of some 200ft. in length. The south elevation has a large conservatory, approached from billiard rooms, smoke and drawing rooms. The western elevation overlooking Fistral Bay has another central tower rising from a very bold circular bay with a corresponding treatment to that of the entrance front, and is of the same length. Internally the plan is a parallelogram, with central north and south sections, and two large internal areas for light and ventilation. In this way the architect, Mr. Trevel, has managed to place all the reception rooms on the outer sides, giving an external or sea view to every window occupied by visitors, whilst all the corridors, lavatories, offices, stores and other subsidiary departments are lit and ventilated from the internal areas. The ground floor comprises entrance, porch, hall, vestibule, &c., which open upon the lounge hall. Its extreme dimensions are about 90ft. long from front door to the main bay window, and 70ft. across the western ocean frontage, broken by piers, recesses, &c. Out of the hall the various corridors radiate, by which access is obtained to the dining room, drawing room, billiard room (two tables), smoke

room, private sitting rooms, and offices of various descriptions. The whole of the joinery and furniture on the ground floor is of solid English oak. Mr. Arthur Carkeek was the builder, and Messrs. James Shoolbred and Co. were the furnishers. The upper floors are approached by a broad staircase of wide tread and easy rise, constructed of fireproof materials, as well as by an electrical lift. The drawing-room is about 50ft. by 30ft., broken by two monolithic Devonshire marble columns with carved caps and bases, which occur also in the lounge hall, and on the main landings in the upper floors. There are about 120 bedrooms and sitting rooms for visitors. The electrical arrangements comprise a detached electrical station fitted with two Campbell's oil engines of 20 horsepower each, with dynamos, storage batteries, and all accessories of the latest type. These drive the entire lighting, the installation consisting of over 600 lamps. The electrical contract was carried out by Mr. Headley, of St. Austell. In addition to the ordinary fireplaces the hotel has a hot-water installation fixed by Messrs. Musgrave and Co., of Belfast. The contract for the terra-cotta facings throughout was let to Mr. Henry Dennis, of Ruabon. The contractors for the mosaic were Messrs. Diespeker and Co., of Holborn Viaduct, London; for the decorations, Messrs. Harris and Co., of Plymouth. The architect was Mr. Sylvanus Trevail, F.R.I.B.A., of Westminster and Truro, Mr. Thos. Parsons being his local clerk of works.

St. Andrews.—The new hall of St. Andrews Company of the Boys' Brigade is almost completed. The building is estimated to cost £2,000. The site is a piece of ground three-quarters of an acre in extent, belonging to the Kirk-Session, and situated at the south end of the town. The hall is built of red and white brick. Standing at the upper end of the spacious parade ground, the building is entered from the north side. The hall is roomy, well-lighted, well-ventilated, and is 70ft. long and 40ft. broad. The walls are left in plain brick. There are five exits from the hall and three entering to the lobby with swing doors, and two to the rear. On one side of the entrance hall is a store, office, and lavatory and bathroom accommodation, while on the other is a dressing or officers' room. Adjoining this apartment is a workshop, with concrete floor, where the lads can spend a spare hour or two at manual work. From the entrance hall is a stair leading to the reading and recreation rooms and gallery. The reading room is 30ft. by 15ft., and is decorated in dark primrose with white roof. The recreation room is similarly treated. The side of the lobby is fitted with swinging glass screens, and when these are opened it is converted into a gallery. The caretakers' house is at the north-west corner of the building, and the heating chamber is located under the hall. In front of the building is a large parade ground, 100ft. by 130ft., while to the rear it is intended to lay out a lawn, the whole being enclosed by a neat iron railing. The contractors for the building were:—Brickwork, Messrs. Street, Ltd., Dunfermline; joiner, Mr. George M'Bean, St. Andrews; plumber, Mr. Andrew Turpie, St. Andrews; painter, Mr. David Todd, St. Andrews; slater, Mr. Thomas Black, St. Andrews; plasterer, Messrs. M'Ritchie, Dundee; heating, Messrs. Low and Sons, Edinburgh; grounds, Mr. M'Dougall; and railings, Messrs. Smith and Co., Glasgow.

Stickney.—The parish church at Stickney was recently reopened after extensive restoration. The parish church of St. Luke is a stone building of the thirteenth century, in the Early English style, consisting of chancel, clerestoried nave and four bays, aisles, and south porch and tower of some two hundred years later date. Large sums of money were spent on the church during the incumbency of the late Canon Colman, who was succeeded in 1893 by the present rector, the Rev. G. H. Hales. In 1853 the chancel was rebuilt at a cost of £1,000, and in 1855 £677 was expended in the restoration of the nave. In 1882 the fine tower, which was built principally of sandstone obtained from the adjacent wolds, was found to be very unsafe, and, at the suggestion of the late Mr. Butterfield, a wooden frame was erected inside the

tower, at a cost of £100, to take the weight of the bells off the walls. But this was found to be of little use, large masses of masonry falling out of the south-east corner of the bell chamber in 1884. Mr. Bassett Smith, of the firm of Messrs. W. and C. A. Bassett Smith, of John Street, Adelphi, architects, was then called in and asked to report on the state of the tower, and he suggested that the bells should be taken out, the upper half of the tower taken down, and the remaining half temporarily roofed over. This was done in 1887, at a cost of £180, and the porch, which had become very unsafe, was also rebuilt by Messrs. Sherwin and Sons, of Boston, at a cost of £150. In 1893 it was decided to begin the work of restoration. Tenders were invited for rebuilding the tower, and that of Mr. S. F. Halliday, of Stamford, was accepted, the price being £1,735, including rehanging the bells. On examination it was found that part of the walls were good enough to stand, so the order was given to repair instead of to rebuild, and it is hoped that the money thus saved will be sufficient to repair the south aisle and the roof of the north aisle. The estimated cost of the present restoration is about £2,500, and towards this sum about £1,700 has been received. The sand required in the building operations was given gratuitously by the farmers of the parish. The work of restoration was carried out under the direction of Mr. W. Chell, of Uttoxeter, clerk of the works. The bells, which were rehung by Messrs. Warner, of London, are four in number. The large bell was cast in 1607, and bears the inscription—"By roaring lowde doth warning give that men heare may not always live." There is another bell of older date with the inscription—"Hujus Sancti Matthæi," and the two smaller bells were recast, it is supposed, from three others in 1803. The old sanctus bell still remains. In exploring the foundations of the tower, part of the old churchyard cross was found. The buttresses of the old church are of Ancaster stone, but the new tower is built of stone from the contractor's own quarry at Stamford.

West Jesmond, Newcastle.—Foundation-stones of a United Methodist Free Church Hall to be erected on a site at the corner of St. George's Terrace and Coniston Avenue, West Jesmond, were laid last week. The hall will form part of a block of buildings which the United Methodist Free Churches of the Newcastle Prudhoe Street Circuit purpose placing upon an extensive plot of ground, situated as already stated. The hall will be constructed to accommodate 350 people. Mr. W. H. Knowles is the architect, and the contract has been entrusted to Mr. Alexander Bruce. The main entrance will be in St. George's Terrace. Double doors will give access to a lobby, from which the hall itself will be reached. There will be a gallery at the east end over the lobby. In addition to the hall the present contract includes two large vestries, boiler house, and cloak rooms. The entrance will be surmounted by a parapet, and a three-light traceried window will be placed in the gable. There will be a small square tower, with a domical roof. The windows on the south or Coniston Avenue side will be grouped, and will also be traceried. The space intervening between the hall and Sunbury Avenue will be eventually occupied by a church, with additional vestries, class rooms, &c. The entrance to the church will be in Sunbury Avenue, at the north end of the site. The style of architecture adopted is modern Gothic, and on the whole is very satisfactory. The buildings will be in sneaked rubble stone, with chiselled dressings. Green Westmorland slates will be used for the roofing. The portion of the scheme now commenced will cost about £3,000.

Enlargement of Romford Cottage Hospital.—At a special meeting of the committee of management Mr. Kennedy attended with plans for the erection of another ward and the conversion of the present operating room into a small ward for cases of severe illness or for distressing accident cases. To carry out the entire scheme it was estimated that with furnishing about £450 was required. It was decided to carry out the work.

Surveying and Sanitary Notes.

New Public Garden at Plaistow.—

On Wednesday last the disused churchyard of St. Mary's, Plaistow, E., and an adjacent piece of ground, both of which have been laid out by the Metropolitan Public Gardens Association, were opened to the public. The laying-out of the garden has cost the association about £400, and makes the 104th ground which the association has provided. The garden has been effectively laid out by the association's landscape gardener, Miss Wilkinson.

Granite Setts at a Premium.—

Unless the Newport Corporation is willing to substitute other material for laying the extension of the tramway service in the town there is likely to be delay in executing the work. Messrs. A. Krauss and Son, of Bristol, the contractors, whose tender at £13,362 0s. 8d. for the laying of the Corporation Road new service with granite setts was accepted at the last meeting of the Corporation, have now notified that they are unable to procure delivery for four months of Aberdeen or Norwegian granite, and it was reported to the Corporation by the borough engineer at the last meeting that Cornish granite was not now procurable.

City Improvements.—

At a meeting of the Court of Common Council last week the Improvements and Finance Committee brought up a report relative to the rebuilding of houses in Leadenhall Street, and the opportunity afforded for an improvement between Billiter Street and Aldgate. It would be desirable to make that portion of Leadenhall Street 50ft. wide, and they recommended that the London County Council should be approached with a view to ascertain whether the Council was prepared to contribute towards the cost—estimated at £636,500. This was agreed to. A plan was approved for continuing the improvement of Blomfield Street, by making it 50ft. wide between East Street and the corner of Eldon Street. A letter from the London County Council asking the views of the Corporation as to the erection of a kiosk and a clock of fourteen shops with rooms over, in the forecourt at Ludgate Hill Station, the committee recommended that the Council be informed that the Corporation was unable to consent, inasmuch as the erection might interfere with the alterations and improvements at the station, which was merely a timber structure, badly lighted, and quite unsuitable for the requirements of the public. The report was adopted.

Proposed Piccadilly Widening.—

The Improvements Committee of the London County Council have considered an important proposal from the First Commissioner of Works for the widening of Piccadilly, between Hyde Park Corner and Walsingham House, who hopes to obtain the assent of the Queen to enable a sufficient strip of the Green Park to be added to the street, and so facilitate traffic passing eastward and westward without interfering with traffic passing northward by Hamilton Place. He undertakes to advise the Queen in that direction if the Council will undertake the expense of setting back the Park railings and of paving the widened carriageway and the new footway. The present width of Piccadilly between Hyde Park Corner and Walsingham House varies from about 68ft. to 100ft.; under the suggested plan it will vary from about 70ft. to about 170ft. At the junction between Hamilton Place with Piccadilly a large refuge would be placed in the middle of the road. Trees now in the Park would remain on the pavement, but ten trees now on the pavement (three of which are young and two dying) would not remain in the roadway. The Committee recommend the Council to co-operate in the scheme, and vote £30,000 for the necessary works.

Laying Telephone Wires in Streets.—

The case of *Attorney-General v. National Telephone Company, Limited*, came before Mr. Justice Kennedy and Mr. Justice Darling in the Queen's Bench Division recently. It was an information by the Attorney-General against

the defendants, the National Telephone Company, Limited, praying, "(1) That it may be declared that the defendant company are not entitled to place or maintain any telegraph wire or wires, tube, pipe, casing, covering, or apparatus for the purpose of telegraphic or telephonic communication, or to execute any other work within the meaning of the Telegraph Act, 1863, under any street or public road, or any part of any street or public road, within the administrative county of London, or to open or break up any such street or public road or any part thereof, or to exercise any other of the powers of executing works which are conferred on the Postmaster-General by the Telegraph Acts, 1863 and 1878, without the authority of the Postmaster-General and the consent of the London County Council for such purpose prescribed by the Telegraph Act, 1892, being duly had and obtained in the first instance and preliminary to any other authority or consent required by law for the execution of any such work; (2) That the defendant company, their officers, servants, and agents may be restrained by the order and injunction of this honourable Court from placing or maintaining or proceeding or continuing to place or maintain any telegraph wire or wires, tube, pipe, casing, covering or apparatus for the purpose of telegraphic or telephonic communication, and from executing or proceeding or continuing to execute any other work within the meaning of the Telegraph Act, 1863, under any street or public road within the administrative county of London, and from opening or breaking up or proceeding or continuing to open or break up any such street or public road or any part thereof, and from exercising or proceeding or continuing to exercise any other powers of executing works which are conferred on the Postmaster-General by the Telegraph Acts, 1863 and 1878, without the authority of the Postmaster-General and the consent of the London County Council for such purpose prescribed by the Telegraph Act, 1892, being duly had and obtained in the first instance and preliminary to any other authority or consent required by law for the execution of any such work." By consent, the Court made a declaration in the terms of paragraph 1 of the prayer, and in lieu of the injunction asked for in paragraph 2 the defendants gave an undertaking not to extend their present system of underground pipes without the consent of the Postmaster-General and the London County Council.

The Cleansing of a Sewer.—

The case of *Baron and Another v. the Portslade-by-Sea Urban District Council* came before the Lord Chancellor, Lord Justice A. L. Smith and Lord Justice Vaughan Williams, in the Court of Appeal last week. This was an appeal from the judgment of Mr. Justice Mathew on further consideration after the trial of the action with a jury at the Lewes Assizes. The plaintiffs were the occupiers of certain premises at Portslade, consisting of a dwelling-house and land used for agricultural purposes. A sewer, which was made by a private individual and which carried the sewage from a brewery and some cottages, passed in an open cutting through the plaintiff's land. This sewer became vested in the defendants under the Public Health Act, 1875. Formerly the defendants, by arrangement with the plaintiffs, paid for the cleansing of the sewer, but in 1898 a dispute arose between the plaintiffs and the defendants, with the result that the sewer was not cleansed. The plaintiffs complained that in consequence thereof large quantities of sewage and filth came upon their land so as to cause a nuisance. The defendants contended that the plaintiffs' only remedy for the defendants' neglect of the statutory duty, imposed by Section 19 of the Public Health Act, 1875, of keeping the sewer properly cleansed, was by complaint to the Local Government Board under section 299 of the Public Health Act, 1875. The jury assessed the damages at £75. Mr. Justice Mathew held that the action would lie and gave judgment for the plaintiffs.—The Court now dismissed the appeal. The Lord Chancellor said that in the present case there was a sewer vested in the defendants. That sewer was formerly cleaned out at certain intervals, and no nuisance was created or

allowed to exist. The local authority seemed to have discontinued that ordinary and natural duty, and they thereby caused a nuisance to a private citizen with respect to his land. There was all the difference between the jurisdiction to call upon the local authority to make new sewers or a new system of drainage and the jurisdiction to compel the local authority to deal with the existing sewers in a proper and reasonable manner. There was no question here as to making new sewers. The plaintiffs' complaint was that the defendants, who had formerly dealt with this sewer in a proper and reasonable manner, had lately neglected to do so, and had thereby caused a nuisance and damage to the plaintiffs. The earlier part of Section 299 of the Public Health Act, 1875, had reference to new works. The only difficulty arose with regard to the later words of the section, but on looking at the context they evidently referred to a duty to be enforced of a kind similar to that dealt with in the former part of the section. The words did not mean that every time the local authority neglected to use proper diligence in the management of the existing sewers the only remedy was by complaint to the Local Government Board. Where there was neglect by the local authority in the ordinary management of sewers, and damage was thereby caused to a private citizen, there was nothing in the Act which took away the ordinary common law right of action.

Purification of Tannery Effluents.—

The case of *The Attorney-General on the Relation of the Sevenoaks Rural District Council, and the Sevenoaks Rural District Council v. Whitmore*, which came before Mr. Justice Mathew sitting with an Assessor, Mr. Baldwin Latham, O.E., in the Queen's Bench Division, was decided last week. The action was tried at Maidstone on July 13th, 14th and 16th. The relators and plaintiffs are the local sanitary authority for the parish of Edenbridge, and the defendants, Messrs. T. and H. Whitmore, are the owners of a tannery in that parish. The plaintiffs claimed an injunction to restrain the defendants from causing or permitting the effluents from their tannery to flow into the sewers of the plaintiffs, on the ground that such effluents were of so offensive and dangerous a character that they caused the effluent flowing from the plaintiffs' sewage farm into the River Eden to be a nuisance to and injurious to the health of the inhabitants of the parish of Edenbridge and the persons living near the River Eden. The defendants contended that the plaintiffs were bound to continue the admission into their sewers of the effluents from the tannery, and that the nuisance, if any, was caused by the inefficient state and unskilful management of the sewage farm; and they alleged that the tannery effluents were as capable of being dealt with by bacterial treatment as ordinary sewage if the sewage farm were properly managed. The plaintiffs further contended that the tannery effluents contained free alkalinity to an extent which rendered them a liquid which would "prejudicially affect the application to land" of the sewage matter conveyed along their sewers, within the meaning of Section 7 of the Rivers Pollution Act, 1875 (39 and 40 Vict., c. 75), and that consequently they were not compelled to receive such effluents into their sewers. It appeared that in 1875, when the local authority constructed a system of sewers leading to settling tanks and thence into the River Eden, the defendants had received a notice requiring them to connect their tannery with the sewers of the local authority, which they had done. In 1886 the present system of sewerage was constructed; and, before connecting themselves with the new system, the defendants, at the request and under the supervision of the sanitary authority, erected settling tanks upon their own premises. Upon the completion of this work the sanitary authority agreed to admit, and admitted, the tannery effluents into their sewers. Dr. Voelcker and Dr. Thudicum were called on behalf of the plaintiffs and stated that in their opinion the tannery effluent contained alkalinity to so great a degree that a liquid resulted which prejudicially affected the application to land of the sewage matter conveyed by the plaintiffs' sewers. Mr. Strachan, Mr. Frank Scudder, and Mr. Santo

Crimp, who were witnesses for the defendants, were of opinion that the effluent of the tannery, in which no chemicals other than vegetable acids and lime were used, in no way prejudicially affected the application of the sewage to land, inasmuch as a considerable quantity of the free alkalinity was reduced by carbonic acid from household sewage in the plaintiffs' sewers and the settling tanks at the sewage farm. They also considered that, owing to the sewage farm being on a clay soil and under-drained, the sewage matter found its way through the cracks in the soil into the under-drains, unaffected by the bacteria on the surface, and so passed in its crude state into the river. His Lordship, in delivering a considered judgment, stated that he was not convinced by the evidence given on behalf of the plaintiffs; and that he relied and acted upon the evidence of the witnesses for the defendants. He gave judgment for the defendants with costs.

Engineering Notes.

St. Vincent's Asylum, Dublin, is being fitted with the latest improved hot-water heating apparatus by John King Limited, engineers, Liverpool.

The Bradstock Lockett Home, near Southport, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Richmond and Chandler, Limited, of Manchester, machine makers, declare a 6 per cent. dividend on the 6 per cent. preference shares and $7\frac{1}{2}$ per cent. per annum on ordinary shares for the year; with £500 to depreciation and £500 to reserve.

Proposed New Esplanade at Gourock.—It has been decided to erect a sea wall and form a promenade extending westwards from Beach Cottage along the front of Craigbank and joining the Ashton Esplanade at Janefield Place. It is estimated that this new esplanade will cost £1,500.

Bad Gas.—At last week's meeting of the London County Council the Public Control Committee recommended the Council to ask the Board of Trade to institute an enquiry as to the cause of the persistent differences between the results of testing the illuminating power of gas supplied by gas companies at prescribed testing places and of tests made with the portable photometer of identical construction of gas supplied to other buildings in the county. The recommendation was adopted, and the Council then adjourned.

Electric Railway Extensions.—The Harrow and Uxbridge Railway Company are taking steps for the acquisition of the land required for their railways, which will connect this undertaking at Harrow with the town of Uxbridge, and the construction of the new lines will shortly be proceeded with.—In view of the importance to the Metropolitan and District Railway Companies of adopting electricity as a motive power a committee, consisting of three members from each of the boards of the companies, has been appointed to consider the question of applying electric traction to the working of the Inner Circle, and it has been agreed between the companies to invite eminent electrical traction firms to submit plans and specifications, with detailed estimates and tenders for the necessary installation.

Electric Companies and Consumers. Eight representatives of the London Electric Supply Companies waited privately upon the President of the Board of Trade, at Whitehall, last week, to ask for an alteration in the Board's regulations respecting voltage. At present the rule to which objection was taken provides that no change shall be made in the pressure of supply except with the consent of the consumer, and for this the members of the deputation wished to substitute words modi-

fying the rule, so that no change could be made except on such terms and conditions as may be agreed between the undertaking and the consumer, or, failing agreement, as settled by an arbitrator appointed by the Board of Trade. Professor Kennedy mentioned that in the district of the Westminster Supply Corporation there were only ten persons objecting to a change from 100 volts to 200 volts. The President, upon this, remarked that perhaps the company had not taken the best course with a view of conciliating these customers, and he suggested that they should consider whether some agreement could not be arrived at. The deputation withdrew upon the understanding that efforts would be made towards mutual agreement.

Electric Tramways in London.—The Select Committee of the House of Lords last week passed the preamble of the Bill promoted by the London County Council under which power is sought to enable electricity to be used as the motive power for tramways which they already own in the Metropolis and for other tramways which, under the Tramways Act, they may acquire. It was stated that the County Council already owned over 70 miles out of the 115 miles of line which exist in London, and by 1911, if their present policy of purchase is pursued, they will have acquired the remainder. The Bill was opposed by the South Metropolitan Gas Company and the Lambeth Water Company, who feared that the proposal would cause electrolysis of their mains, and by the Lambeth and Wandsworth local authorities, who urged that they were not given adequate protection under the Bill. The Committee ordered provisions to be inserted for their protection.—The Light Railway Commissioners, the Earl of Jersey presiding, held an inquiry recently at Kingston-on-Thames into an application by the British Electric Traction Company for an order to construct electric tramways in Kingston and Surbiton and part of the districts of Esher and Thames Ditton. The application was opposed by all the local authorities concerned and also by the Surrey County Council. After hearing counsel the Commissioners intimated that they could not see their way to grant the order applied for.

Local Water Supplies.—At the monthly meeting of the executive council of the County Councils Association, held last week, the committee appointed to consider the question of the sources of water supply which were or might become necessary for local consumption presented their report. It stated that, though the replies which it had received to a circular issued to local authorities on the subject were not numerous, they were sufficient to show that in most counties in England and Wales there are districts where the supply of water required to meet the wants of the locality is imperilled, or is likely to be imperilled in the immediate future. This is attributed, in the majority of cases, to the action either of water companies or of colliery proprietors. Valuable suggestions were contained in the replies of some of the authorities consulted. The committee entered into communication with the Association of Municipal Corporations, and at a meeting on February 14, 1900, the opinion was generally expressed that the best course would be to introduce a Bill into Parliament dealing with the question, with the object of having it referred to a Royal Commission or Select Committee of the House of Commons. No formal resolution was proposed, but the committee of the County Councils Association undertook to draw up a statement embodying its proposals in outline, in the hope that such proposals might form the basis of a Bill which would command the approval of both associations. The executive council resolved to have a Bill embodying the proposals of the committee drawn, with a view to its being introduced into Parliament next session.

The Prix de Rome.—The first grand prize for the Prix de Rome painting has been awarded to Sabatte, the second to Rousseau and the third to Azema—all three pupils of Gustave Moreau. The subject chosen was that of a Spartan father showing to his sons slaves purposely made drunk, for a moral lesson.

Keystones.

The Memorial Stone of a Fire Station in course of erection in Redcross Street, City, was laid last week.

The Statutory Registration of Architects was approved at meetings in Manchester and Liverpool held by the Society of Architects last week.

The Housing of the Working Classes Act (1890) Amendment Bill passed through Committee in the House of Lords last week.

A Statue of Lavoisier, the pioneer of modern chemistry, has been erected at the back of the Place de la Madeleine, opposite the Rue Tronchet. M. Barraix is the sculptor.

Principal Grant-Ogilvie, of the Heriot-Watt College, Edinburgh, has been appointed by the Lords of the Committee of Council on Education Director of the Science and Art Museum at Edinburgh.

The Hospital for Epilepsy and Paralysis has acquired a new site, and has in hand no less than £12,500 towards the £25,000 needed for the completion of a new hospital containing from 50 to 60 beds.

A New Drill Hall for Slough.—Mr. James Galliman has given £1,000 and a site in the centre of the town for a new drill hall, to be used by the Slough Volunteers, provided a building to cost not less than £3,000 be erected free of debt.

A New Town Hall for Bangor formed the subject of a Local Government Board inquiry last week. The Bangor Urban District Council ask for sanction to a loan of £1,600 for the purpose of purchasing the endowed school premises, so that they may be converted into a new Town Hall.

Sessions House.—The Court of Common Council have resolved to levy a county rate of twopence in the pound for the year ending September, 1901, for the provision of £40,000 required by the Government for the purchase of the male wing of Newgate, under the scheme for rebuilding the Sessions House.

The Decoration of the Royal Exchange.—Mr. and Mrs. Normand are making good progress with the panels they are doing for the Royal Exchange work upon which they have both been engaged for some long time now. Mrs. Normand (Henrietta Rae) is the first woman artist to receive a commission for one of the panels.

Roof Garden for London.—It is stated that Mr. George Lederer proposes to build an American Roof Garden in London. He proposes to follow the model of the New York Casino Theatre in having a glass roof with the sides left open. We imagine he will find a great difficulty with the London Building Act and our Theatre Regulations.

The Wesleyan Church at Mellor, Blackburn, is being enlarged by the addition of a new chancel. A Willis's organ is also being erected and a stained glass window has been given. A marble pulpit is also being executed by Messrs. Harry Hems and Sons, of Exeter. The chancel and organ will cost about £1,800, and the window another £1,000.

The Dean Vaughan Memorial Church in Mortimer Road, Kensal Rise, W., was consecrated last Wednesday by the Bishop of London. The foundation-stone of the church was laid a year ago by Princess Henry of Battenburg. The site was given by the Bishop of London's Fund, and the Ecclesiastical Commissioners have given an endowment of £200 a year. The total cost of the building is about £9,000, and £4,000 is still required for a steeple.

A Proposed Isolation Hospital at Draycott formed the subject of a Local Government Board inquiry last week. The Derbyshire County Council asked for sanction to borrow £7,315 for the purchase by the Shardlow Isolation Hospital Committee of land, and the erection thereon of an isolation hospital. Mr. Scott, an adjoining owner, and the Draycott Parish Council opposed the

scheme. The plans have been prepared by Mr. Anteliffe, architect.

Belgian Honours for Art Workers.—It is announced that the King of the Belgians has conferred upon Sir J. C. Robinson, Her Majesty's Surveyor of Pictures; Mr. Lionel Cust, the Director of the National Portrait Gallery; and Mr. Claude Phillips, the Keeper of the Hertford House Collection, the Cross of Chevalier of the Order of Leopold, as an acknowledgment of the assistance given by them in the organisation and arrangement of the Van Dyck Exhibition at Antwerp.

The Late Professor Max Koner.—The sudden death of Professor Max Koner, of the Berlin Academy of Arts, is a severe loss to artistic and scientific circles. The Kaiser has sat to him several times, which naturally made him a fashionable portrait painter. He had not reached his forty-sixth year, and had lately received the French gold medal for his portrait of the Kaiser exhibited in Paris. Koner was a native of Berlin and educated at the Berlin Academy. He was a teacher there for ten years, and in 1892 was nominated Professor.

Florence's Art Museum.—The new rooms in the Galleria degli Uffizi, at Florence, in which the objects of art sold to the Italian Government by the Hospital of Santa Maria Novella are placed, will be opened shortly. These treasures include an altar step of chased silver, the work of Andrea Pucci da Empoli; breviaries by Lorenzo Monaco; reliefs by Donatello; and the great triptych of the Adoration of Christ by the Virgin and Apostles, by the Flemish painter, Vander Goes.

No English.—In Florence just now the English art students may or may not provide the makings of a formidable "school." Native jealousy may possibly be the cause of any disparagement of the Italian onlooker, especially at this rather unpopular time for Englishmen—even for English art students—abroad. Anyway, "the Arno English Artists' Club" has been started, and a letter from an Italian brother-of-the-brush has reached one of the members, innocently addressed to "The Arno-English-Artists' Club."

The Guildhall Loan Exhibition which has just closed seems to have been quite as successful as any of its predecessors in the same gallery. More than 200,000 people visited it during the three months that it remained open, and its exceptional interest was universally recognised. It was the ninth of a series which has in many ways a claim to be considered unique; and it certainly compared well with any other show of the same character which has during recent years been organised either in London or the provinces.

Sale of an Historic Site.—Considerable interest centred in the sale by auction at Canterbury last week of a portion of the site and ruins of the ancient church of St. Pancras, together with a portion of the site of the famous abbey church of St. Augustine. The latter contains the burial places of the saint himself, of King Ethelbert and Queen Bertha, and all the early archbishops of Canterbury. Altogether the sites occupy nearly three acres of land. At £3,000 they were sold to Mr. Vigers, estate agent, on behalf of Lord Northbourne, Canon Routledge, Mr. St. John Hope and Mr. Bennett Goldney, who appeal for subscriptions to enable them to excavate it and then hand it over to St. Augustine's Missionary College.

The Leeds and Yorkshire Architectural Society sends us its annual report for 1899-1900. It is regrettable that the membership has fallen from 121 members last year to 111, as we had hoped that this very strong provincial society was showing the same progress as nearly every other in reducing the number of unattached men, and thus tending to bring greater education among the members of the profession. Still we hope the falling back is only temporary. We trust the Council will continue to hammer away at the subject of competitions in their locality. The balance in favour of the society is £130 5s. 9½d. A number of competitions for members of the society are announced and should evoke keen interest.

A New Poor Law Infirmary is being erected by the Board of Guardians of the West Ham Union at Forest House, Leytonstone. In 1836, when the Union was formed, the population of the parish was under 30,000, and now it is nearly 700,000. The rateable value has increased from £100,000 to over £2,000,000. Forest House, with 45 acres of ground, has been secured, and on an area of 30 acres the new infirmary buildings will be erected at a cost of about £225,000. The wards will be in four three-storeyed blocks, connected one with the other by a central corridor, and provided with fire-escape bridges. There is to be an administrative block, with the usual officers' quarters and outhouses, and a chapel to seat 200 persons. Accommodation will be provided for 672 patients.

A Shields Housing Scheme.—Colonel A. G. Durnford, Commissioner to the Local Government Board, recently held an enquiry into the proposal to build dwelling houses for the working classes at South Shields on the large site known as the Fairles Estate. The property in the vicinity of the North Park, and consequently in close proximity to the Fairles Estate, is chiefly valuable residential property, and the occupiers of the houses strongly opposed such a course being taken as has been suggested by the Corporation. The contention of the residents was that the erection of workmen's dwelling houses to accommodate the occupants displaced by the acquisition of property for street improvements in Thrift Street would depreciate the value of the adjacent property.

New Hospital at East Ham.—The foundation stone of the Passmore Edwards Hospital, Shrewsbury Road, East Ham, was laid last week. In 1897, a committee of the district suggested the building of a hospital in commemoration of the Diamond Jubilee of the Queen, and when some hundreds of pounds had been raised Mr. Passmore Edwards promised to build a hospital at a cost of £4,000 if a site was found for it. The committee secured Shrewsbury House, East Ham, and its grounds of about an acre and a half for £3,500, and of that sum but £800 has yet to be raised. The estimated cost of maintenance is £500 per annum, and towards that sum the committee have the rent of Shrewsbury House (£80) and a promise of £100 a year from the school teachers of the neighbourhood.

The Colossal Statue of King Alfred which Mr. Hamo Thornycroft, R.A., has been commissioned by the Mansion House Committee to undertake is to be completed by next mid-summer. The full-sized model in clay has already been finished. The statue itself measures 14ft. from the crown to the feet. The figure of the king is represented standing with one arm resting on his shield, the other held aloft, the hand grasping his sword so that the cross belt is held uppermost. The pedestal of rough-hewn granite in a single block will be over 20ft. high, and will weigh close on 40 tons. £4,448 has already been received or promised towards the memorial, and £2,000 more is required. Subscriptions may be sent to the Lord Mayor at the Mansion House, to the principal banks, or to Mr. Alfred Bowker, the hon. secretary, King Alfred Commemoration Fund, Guildhall, Winchester.

No. 67 Lincoln's Inn Fields, which is that freehold half of the great historic mansion situated at the north-west angle of the Fields and the corner of Great Queen Street, and known variously, since the date of its erection in 1686, as Powis House, Somers House and Newcastle House, has been sold at the Mart, Tokenhouse Yard, by Messrs. Farebrother, Ellis, and Co., for the sum of £14,400. Some eighteen years ago £17,000 was given for it, and £3,000 was laid out upon it by the recent occupiers. The lowness of the price fetched for the property is rather remarkable, because it should possess additional value from the fact that it is only a few yards from the intended thoroughfare from Holborn to the Strand. The old mansion has been divided into two parts for many years. It was built by the Marquis of Powis, on the site of a former house destroyed by fire in 1684, from the designs of Captain William Winde, a pupil of Inigo Jones,

and Lord Powis forfeited the house to the Crown for his adherence to the cause of James II. Afterwards it was inhabited for a time by the great Lord Chancellor Somers, and in February 1696-1697 it was ordered to remain in the possession of the Lord Chancellor during his custody of the Great Seal. It was subsequently sold to the Duke of Newcastle, the Whig Prime Minister.

The New Pier at Brighton.—The Marine Palace Pier at Brighton, near the Aquarium, is fast approaching completion. Its total length (exclusive of the landing stages) is 1,710ft., which makes it one of the longest promenade piers in England. The deck covers a space of no less than two and a half acres. The pier is built of steel, which gives it both strength and lightness. The toll-houses are somewhat insignificant in appearance—the Town Council having refused to allow them to be made larger. The great pavilion at the seaward end is of Moorish design, the main structure being of wrought iron and steel. Besides the ordinary exits, there are emergency exits. The seats have been arranged on an incline, so that a full view of the stage can be obtained from all parts. Refreshment, reading, cloak and bathing rooms have been provided. An important feature is the landing stage at the pier head, built of steel and iron, and with platforms at three different levels. Owing to the great length of the pier, the head enters deep water, sufficiently so to allow of steamers of heavy draught landing their passengers at any state of the tide. The popularity of the steamboat service at Brighton has been very considerable of late years, and with the great facilities offered by this new pier it seems probable that this attraction will be still more in request. The pier and pavilion will be lighted by electricity.

Trade and Craft.

Artistic Tiles.

We have received from Messrs. T. and R. Boote, Ltd., of the Patent Tile Works, Burslem, a copy of their new glazed-tile pattern book, which is most handsomely produced in colours. It is one of the most complete books issued by the trade, and its compilation has cost a large amount of money and labour, many of the patterns being by first-class designers. Tile design is a matter that requires a lot of skill and principle, and we find in this branch of art the same differences of opinion that become sometimes so acute in connection with pictures and buildings. One school—particularly the British school—works on lines which are in direct opposition to the methods of others. Take a rose, for instance; in decorating a plate with it they would paint it realistically, and would render all the shadows and tones that we find in Nature, making the rose to appear as a raised object on the plate. The other school—and we think decidedly the more correct one—attempts no such thing; what they do is to take the lines of the rose as a theme for design, and they produce a decorative flower which appears as a plane object, its lines in harmony with those of the plate which it adorns. This treatment of line and arrangement of design to surroundings is a special characteristic of Japanese art, and the method is one which is finding more adherents every year. We are therefore glad to see in Messrs. Boote's catalogue a large number of decorative designs. The firm stock a variety of plain and mottled tiles that should satisfy the most fastidious purchaser. On the second page of the catalogue are shown some excellent designs for hearths and panels, and the very large number of designs for tiles are a proof of the capacity and the capability of the firm's workshops. A great many of the designs are treatments of flowers, but there are also numerous geometrical patterns. Messrs. Boote are too well-known to need much recommendation. We feel sure that any of our readers requiring tiles or similar goods will find that this firm will be able to meet their requirements in the most satisfactory and reasonable manner.

New Patents.

These patents are open to opposition until September 4th.

1899.—Shoring and Strutting.—10,832. W. BALMER, 3 Northbourne Street, Newcastle-on-Tyne. The shores are of two or more tubular parts fitted together in telescopic fashion, each lower part being adapted to receive a filling to support the bottom of the next part above, so as to allow of their being used in various depths by varying the amount of the filling.

Portable Huts or Houses.—13,895. E. PAYART, 5 Henrietta Street, Cavendish Square, Middlesex. Double walls are formed of overlapping sheets of corrugated iron, bolted together, with bars or horizontal partitions between. The walls are then filled in with sand or other material. The roofs are constructed in a similar manner.

Paving Material.—14,201. W. DUDMAN, 34 Mansfield Road, Walthamstow, Essex. Gas lime which has been dried and sifted is added to boiling pitch; burnt flints, crushed to a powder, are then added, and the mixture boiled for two hours. It is then ready to be laid as a paving by spreading with wooden floats and covering the surface with hot sand.

Artificial Stone or Cement.—16,501. STEFAN ZIENTARSKI, Wspolna Street, 47A, Warsaw, Russia. Pulverised unburnt clay up to 15 per cent. is added to the unslaked lime powder, in addition to the usual materials for retarding the slaking, such as alum or gypsum. The mixture is then reduced with sand to a plastic state by water.

Fixing Handles to Tools.—17,096. O. MORGAN, Market Place, Penkridge, Staffordshire. The head of a pick, mattock or other tool has a wedge-shaped bridge piece across the eye in order to expand the handle or haft end tightly within the eye.

Cement.—17,853. Firm of Terranova Industrie, C. A. KAPFEER AND SCHLEUNING, 27 Brienerstrasse, Munich. With the object of avoiding the ordinary grey colour of cement a clay free from iron is mixed with felspar also free from iron and lime, and made into a cement in the usual manner.

1900.—Automatic Acetylene Gas Generator.—2,631. G. A. HERVIEU, 41 Avenue de Puteaux, Nanterre, France. Calcium carbide cartridges are automatically distributed into a generating receptacle by the movements of the bell of a gasometer. The generator is also arranged to automatically evacuate the residues of spent carbide, and by its general arrangement does away with the use of any cocks or valves.

Hospital or Infirmary Water-Closets.—4,993. M. J. ADAMS, Park Lane Sanitary Works, Leeds. The basin of the closet is carried above the floor, supported by a slab or downward extension of the closet which carries the weight. The flushing is done with a "low down" cistern having a well formed below in which the outlet valve is fitted.

Connection for Flushing Pipes.—6,073. E. H. BURGESS, 18 Oldhill Street, Stamford Hill. A joint for connecting the flush pipe from flushing tank to the arm of flushing rim of an earthenware closet is formed by a brass nipple with male thread, over which a brass nut, with milled edge and set screw, closes a rubber ring in a brass shield up to the flushing rim of the closet.

Pumps for Clearing or Testing Drains.—6,216. E. NOPPEL, 803 Callow Hill Street, and E. A. NOPPEL, 2071 Ridge Avenue, Philadelphia, U.S.A. The invention consists of a combined lift, force and test pump, consisting essentially of a pumping device and a cup, the latter being bifurcated on the edge to form two members of yielding material. The suction first produced holds the outer member in contact with the surrounding surface of the drain and afterwards the compression of the air in the cup presses the inner member down, thus holding the pump in contact with the surface.

Bob Level.—9,360. F. SINKOVIC, Klausenleopoldsdorf, Austria. Consists of a triangle, the base being formed of a straight rule and the sides of a cord attached to the rule and carrying a weight at its middle point. The bob is attached to the middle point of the base.

Beams or Girders.—9,574. G. STOCKFISCH, 7 Unter Pettenhennen, Cologne, Germany. Iron beams or girders constructed with the under flange or side piece widened or extended are strengthened by having transverse webs at certain distances fixed to them, thus forming bearing surfaces for the joists or transverse beams on the under flanges.

The following specifications were published on Saturday last, and are open to opposition until September 11th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—13,954, LOVELL AND KING, machines for bevelling glass. 13,962, HOLMES, acetylene gas generators and holders. 14,119, LANE AND RAINFORTH, hydraulic valves. 14,292, YOUTEN, stoves for heating purposes. 15,613, HOUGH, elevators. 16,194, MOSES, acetylene gas generator. 16,763, WORSNOP, method of preparing carbide of calcium. 16,857, WILLETTTS AND ROTHAN, pulley blocks, hoists, lifts, crabs, &c. 17,366, LAWSON, glazing for roofs. 17,396, SCHNITZLER, apparatus for generating acetylene. 17,398, ROWALD, bricks for forming flat ceilings, which may also be used for casings and partition walls. 17,470, BRÖCKER, tiles of cement with interlocking joints. 17,622, SHORROCK, louvres or ventilators. 17,649, BRODIE AND PRIOR, fire grates and appliances used with fire grates. 17,804, MASON AND MASON, water closets. 18,012, TAYLOR, decoration of ceilings, walls, &c. 18,160, SWINNEY, automatic separating table for brick machine. 18,265, BURDICK, apparatus for spraying paint, ink, and other pigments. 19,477, SIMMANCE AND ABADY, street lighting apparatus. 25,006, KLEINSTEUBER, manufacture of plastic materials.

1900.—782, JOHNSON, ventilators. 6,455, HATSCHKE, imitation stone, plates slabs or tiles. 6,957, PUECH, apparatus for filtering sewage. 8,150, LAKE (*Christensen*), construction of kilns. 8,508, OPLATEK, combined shovel and weighing device. 8,637, NEWTON (*Carleton*), fastening devices for windows. 8,790, FAIRWEATHER (*Standard Incandescent Burner Co.*), incandescent oil-lamp burners. 9,074, BEAUBEGARD AND GOODING, door checks and springs. 9,643, FLETCHER, gate operated locks for elevators. 9,725, VORDTRIEDE, building bricks. 9,738, SCHULZ, fire-proof floors or ceilings. 9,804, BIALOWAS, automatically operating locks for sliding doors. 9,813, THOMAS, ventilating appliances. 9,967, STIGLIZ, machines for working stone surfaces. 10,014, ROWCLIFFE, hammer. 10,023, MICHAELIS, means for cleaning tramway rails. 10,292, SIMPSON, STRICKLAND AND CO., LTD., AND CROSS, direct-acting steam pumps.

New Companies.

Johnby Wythes Tilery Co., Ltd.

This company was registered on July 16th with a capital of £1,500 in £5 shares to acquire a lease of the premises now used as a tilery at Johnby Wythes, Skelton, Penrith, and to carry on the business of tile manufacturers, &c. Registered office: Johnby Wythes, Skelton, near Penrith, Cumberland.

Biltons, Limited.

This company was registered on July 19th with a capital of £7,500 in £1 shares to carry on the business of earthenware manufacturers, potters, brick and tile makers, &c. The first directors (to number not less than three nor more than five) are E. Bilton, L. Bilton and J. W. Bilton. Registered office: London Road Works, London Road, Stoke-on-Trent, Staffordshire.

Economiser, Limited.

This company was registered on July 20th with a capital of £20,000 in £1 shares to adopt an agreement with A. Z. Germaine, to acquire certain patents relating to a lamp and stove-chimneys, fuel economising appliances, &c., and to carry on the business of chimney cowl, lamp and stove manufacturers, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers.

Bannisters, Limited.

This company was registered on July 14th with a capital of £5,000 in £1 shares to adopt an agreement with J. Bannister, T. Abbott and S. Bannister to acquire and deal with real and personal property of all kinds, and to carry on the business of builders, contractors, decorators, stone, sand, lime, brick, timber and hardware merchants, &c. The first directors (to number not less than three nor more than five) are to be appointed by the subscribers. Registered office: 29 York Street, Sheffield.

COMPETITION.

COUNTY BOROUGH of CARDIFF.
PROPOSED NEW ASYLUM.
TO ARCHITECTS.

The Corporation of Cardiff invite Architects experienced in Asylum work to submit their names for selection to send in COMPETITIVE DESIGNS for the NEW BOROUGH ASYLUM to accommodate about 800 patients, and proposed to be erected at Whitchurch, near Cardiff.

Each Architect submitting his name must state in his application his experience and the names of any similar buildings carried out under his supervision, and must also state the terms upon which (if ultimately successful in the competition) he would be willing to undertake the erection of the buildings, including the preparation of all plans, specifications, and quantities, and the necessary supervision of the work.

Applications, endorsed "Asylum Architect," to be delivered at my office not later than TUESDAY, APRIL 17th, 1900.

By order,
Town Hall, Cardiff, J. L. WHEATLEY,
March, 1900. Town Clerk.
